The consequences of a deficiency of mental activity it may be useful for us now to consider. Keeping in mind that the brain is an organized part of the physical system, and, therefore, subject, like all other parts, to the general laws of growth and decay, we may comprehend how any part of it may become weakened and diseased by inactivity. We must bear in mind, in considering the effects of mental inactivity, that the brain is not only the seat of intellect, but also of the social and moral feelings, and that by exercising one of these classes of faculties exclusively, we treat the brain as irrationally as we would the muscular system by binding one portion of the body in splints and giving to the other vigorous exercise. If a man were to shut himself out from society, and devote himself exclusively to a single monotonous occupation for a considerable time, he would certainly develop irritability and weakness of the nervous system from the non-use of the large portion of the brain which is called into activity by intercourse with society. Mr. Combe speaks of a young officer who spent three years commanding a small detachment, in a remote station in Canada. Being cut off from all intercourse with those of his own rank, he spent his time mostly in fishing and hunting. From want of the healthful excitement which is afforded to a large portion of the brain by the society of equals, he found on his return home, that his nervous system had become so weak and irritable that he feared to meet even the members of his own family, and for weeks he would not venture to walk out except in the dark. It required several months to restore the tone of his nervous system, so as to enable him to return to his former habits of life. "In this predisposed state of the nervous system," says Mr. Combe, "a very slight cause would obviously have sufficed to convert the depression into absolute derangement."

"The deaf and dumb," says Andral, "presents in his intelligence, character, and the development of his passions, certain modifications which depend on his state of isolation in the midst of society. He remains habitually in a state of half-childishness, is very credulous; but, like the savage, remains free from many of the prejudices acquired in society. In him the tender feelings are not deep; he appears susceptible of neither strong attachment nor lively gratitude; pity moves him feebly; he has little emulation, few enjoyments, and few desires. This is what is commonly observed in the deaf and dumb, but the picture is far from being of universal application. Some, more happily endowed, are remarkable for the great development of their intellectual and moral natures; but others, on the contrary, remain immersed in complete idiocy." Andral adds: "that we must not infer from this that the deaf and dumb are, therefore, constitutionally inferior in mind to other men. Their powers are not developed because they live isolated from society. Place them, by some means or other, in relation with their fellowmen, and they will become their equals."

We find, even in society, abundant illustrations of the evil effects of the non-exercise of the mental faculties. Many business men, for instance, after having devoted the best part of their lives to the acquisition of wealth, promise themselves much enjoyment in the ease and leisure of retirement, as a fitting

reward for their many years of laborious industry. But, instead of enjoyment, they often find mental and physical languor, because of the withdrawal from their brains of the nervous stimulus to which they have been so long accustomed. So many individuals from whom wealth removes the necessity of engaging in some active employment, are often afflicted with ennui, and become morose and discontented from lack of that agreeable stimulus to the brain and nervous system furnished by active mental faculties. The necessity of both mental and physical labor is thus impressed on the constitution of man. They who ignore this institution of the Creator, and seek enjoyment in a life of indolence, will never find that which they seek, for the truest happiness of life is that which springs from the harmonious activity of all our faculties in some occupation which contributes not only to our own comfort and enjoyment, but also to the well-being and happiness of our fellow-men.

Having considered the evil effects of excessive and deficient mental exercise, it now remains for me to introduce a few observations upon the conditions for the proper activity of the mental faculties. We have seen, in a previous letter, that because the exercise of a part of the body determines the blood and nervous energy to that part, two classes of functions can not be called into vigorous activity at the same time without diminishing the energy of each, and sooner or later inducing disease. Hence I laid it down as a physiological law that muscular exercise should be refrained from immediately after eating, because of the concentration of the blood and nervous energy in the stomach during the process of digestion. For the same reason I would now advise you to avoid all mental application immediately after meals. Light conversation or light, pleasant reading, may be indulged in to advantage, but serious study will certainly prove injurious. The importance of this law is well illustrated by the fact that sudden bad news or deep grief takes away the desire, and even causes a loathing for food, though we sat down at the table with a keen appetite. It is well, also, to avoid severe mental application just before going to bed, that the blood may be withdrawn from the brain, and the nervous system reduced to that state of quiescence which is favorable to sleep. Sleep being the means ordained by the Creator for restoring the wasted nervous energy to the brain and muscles, it is of the highest importance that nothing interfere with the obtaining of an abundant and regular supply of this restorative. If you retire immediately after vigorous mental exercise, the blood which is coursing through the brain can not be at once withdrawn, and a habit of wakefulness is likely to be formed which will be difficult to overcome, and which, if persevered in, will ultimately induce an irritability of the nervous system approaching to insanity.

Another condition for the proper activity of the brain is regularity in mental exercises. There is a tendency in all bodily functions to resume the same mode of action at stated intervals. Thus the stomach digests food best if it be eaten at regular hours. The body receives the greatest benefit from exercise which is taken at a fixed time every day. Sleep also tends to come on at a stated hour, and we wake as regularly as the hands of the clock go round. The nervous system is peculiarly susceptible to this law of periodicity, and performs its function best when it is called into activity at fixed and definite hours. It is important, therefore, that you have regular hours for studying as well as for eating, exercise, and sleep. Accustom yourself to regularity in the performance of every duty, and you will find every bodily and mental organ acquiring an inclination to act and a facility in acting in the highest degree conducive to the energetic performance of its function. Devote the fore part of the day to the most important part of your studying, and reserve the evening for your lightest mental exercises. Retire at an early and regular hour—say half-past nine—and rise at six. Accustom yourself to banish every thought from your brain the moment you lie down, and between these hours you will be able to obtain an abundant supply of refreshing sleep.

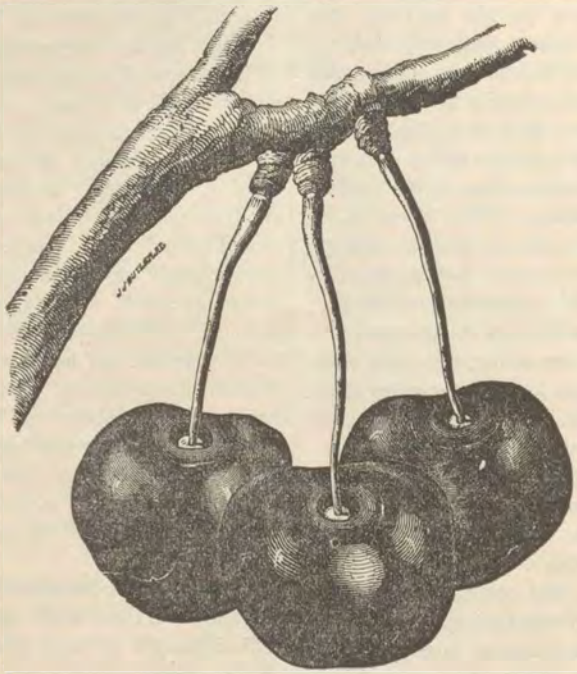
It is to be remembered, also, that the brain is the organ of every desire, every feel-

ing, and every sentiment which arises in the mind, as well as of thought and intelligence, and hence, in the formation of character, we must be guided by the same general laws as in the acquisition of knowledge. To become skillful in mathematics, music, and drawing, we must habituate ourselves to the actual practice of the mental and manual operations required in these different branches. The music teacher does not expect to make his pupils skillful in his art by merely giving them instruction in the rules of music; but he places them before the instrument, and trains their fingers by actual experience to properly strike the keys, knowing well that it is only by continued and reiterated practice that they can acquire the precision and facility of expert performers. So in the development of character, it is not enough that the mind be instructed in the principles of truthfulness, justice, and benevolence, but we must place ourselves in situations where the organs which preside over these sentiments will be called into activity, for it is only by the actual practice of these virtues that the parts of the brain which preside over their manifestation acquire energy and facility of action. If you wish to cultivate a charitable and kindly disposition, you must go where poverty and sorrow exist, and put forth the hand to relieve the distress. Would you be truthful and just in character, habituate yourself to the practice of these virtues in your intercourse with your fellow-men. Would you be bold, determined, steadfast, and self-reliant, throw yourself into the midst of difficulties and responsibilities, where the parts of the brain which preside over these dispositions will be called into activity, and rendered prompt and energetic to manifest them habitually. It is thus that habits grow, and character is formed. That which is merely an inclination in the beginning, becomes by frequent repetition, an impulse which the strongest will is powerless to control. If we seek for occasions which call into play the truthful, kindly, noble, and generous qualities of our nature, we gradually develop these characteristics till they become the guiding and controlling principles of our lives. If, on the other hand, we associate with the vicious, the depraved, and the abandoned, we insensibly grow like them in character, because our lower nature is called into habitual activity, and the elevating and ennobling powers of mind are allowed to remain in a state of quiescence. Choose your associates, your reading, your amusements, and your occupation, then, with a view to the activity of your higher nature, and you will insensibly grow toward the full stature of a generous and noble manhood. Affectionately yours,

PATER CONFIDENS.

How Tobacco Impairs Vitality.—The Senior-physician to the Metropolitan Free Hospital in London writes as follows: "I can testify, from long observation, that the chronic use of tobacco in any form is a very prevalent cause of debility and manifold diseases. Take, first of all, the sense of sight. One of our most celebrated London ophthalmic surgeons tells me that he is continually consulted by young gentlemen for weakness of vision caused by smoking; and I myself have in many cases seen the prolonged use of tobacco, especially when it is chewed, cause total loss of sight. Then take the circulatory system, and we find smokers subject to palpitation of the heart, and far less able to bear up against extremes of cold and heat than they were before making use of tobacco. The use of tobacco is apt to cause relaxation of the muscles of the back of the mouth, and dusty discoloration of the fauces, with hoarseness from congestion of the vocal cords. The overwhelming majority of cases of cancer of the lip are found in men who smoke, and cancer of the tongue has often been said to be caused by the irritation of the fumes of the pipe or cigar. Great smokers lose, to a great extent, their vivacity, *i. e.*, they are less vital than they used to be, and less easily moved by slight *stimuli* which might prove pleasureable to non-smokers. They are notoriously dyspeptic. I need hardly refer, indeed, to such a well-known fact. They are subject to constipation and *malaise;* and when deprived of their stimulus, are more miserable, perhaps, than even drinkers. I must take the liberty to protest against a custom which has been inveighed against by Brodie, Copland, Critchett, Guerin, Mantegazza, Cacopardo, and numerous heads of my profession in all countries."

MEDIÆVAL HYGIENE.



THE excellent Archbishop Fénelon in his celebrated book, "The Adventures of Telemachus," has something to say with regard to the kind of treatment of wounds and diseases inspired by Minerva, who attends the wandering youth in the guise of a counselor. Some of our readers will, perhaps, remember the incidents in the war undertaken by Telemachus in behalf of Idomeneus, and how, on one occasion, after a battle, there being many wounded, two physicians, whom Telemachus had engaged, gave their services to the wounded and the sick. One of these physicians, Nosophugus, is particularly described, and his system is not without its admonition to our modern doctors. Translating freely from an old edition a pargaraph or two as follows: "Scarcely had he seen a patient when he recognized, by the appearance of his eyes, by the tint of his skin, by the posture of his body, and by his breathing, the cause of his illness. Sometimes he gave remedies which occasioned sweat, and he showed by the effects of the sweating how perspiration retards or facilitates, deranges, or restores the whole bodily mechanism. Sometimes he gave for affections of a debilitating character certain draughts which strengthened little by little the noble parts, and which renewed the vigor of men through the purification of their blood, but he insisted that it was on account of the want of virtue and courage mainly, that men so often had the need of medicine. 'It is a shame,' said he, 'for men to have so many maladies, for good habits conduce to health. Further,' said he, 'their intemperance changes to mortal poison the food intended for the preservation of life. Pleasures entered upon without moderation shorten more the days of men than remedies can lengthen them. The poor are less frequently sick on account of their want of nourishment than the rich on account of their having too much. Food which pleases the appetite too much, and makes us eat beyond our need, poisons instead of nourishing. Remedies themselves are true evils which wear out nature, and should be only used in urgent cases. The grand remedy which is always innocent and always useful is sobriety, temperance in pleasure, tranquillity of mind, exercise of body; thus one can have sweet blood and an even circulation, and all the superfluous humors may be disposed of.'" We are told, also, that this sage "was less admirable on account of his remedies than on account of the regimen which he advised for the prevention of disease, and for rendering remedies useless."

Our later hygiene can scarcely boast higher principles than these which adorned the best medical thought of two hundred years ago.

TYPHUS FEVER AND DRAINAGE.

THE *Deutsche Medicinische Wochenschrift*, of Berlin, furnishes some very important statistical data on the relation of typhal fevers to the cleanliness of German towns, from which it appears that the mortality of this disorder is diminished very specifically by an adequate sewerage system. In Hamburg, which has had a regular system of sewers longer than any other German city, the statistics for the seven years previous to the introduction of sewers (1838–'44) show a mean mortality from typhus fever, as compared with the whole number of deaths, of 48.4 per thousand; while, during the nine years in which their introduction was in progress (1845–'53), it fell to 39.3. During the first eight years after their completion (1854–'61), the mean mortality from typhus fever was 29.3 to the thousand deaths. During the second eight years (1862–'69) it fell to 25.7—that is to say, to about half of what it was before sewers were introduced. For the three years 1872–'3–'4 the reports of the medical inspector showed a mortality of 2.68 only for those parts of the city in which the sewerage system was perfect, while it was 3.2 in certain districts in which sewers were being laid.

and 4.6 in the suburbs where there were no sewers at all. In two of these outlying villages the mortality from the fever was 7.0 and 6.6 against 2.68 in the central portions of the city. In Halle, from 1852 to '61, inclusive, the mortality from the fever was 36 per thousand, and during the epidemic of 1862–'3–'4–'5 it rose as high as 194, 215, 254, and 166. In 1870, with the introduction of the new water supply, it fell to 14. After a study of all the facts and statistics, the writer, on no less authority than Professor Virchow, comes to the conclusion that the contamination of drinking water by means of sewage matter soaking into the earth, is the special manner in which typhus usually originates in German towns and villages.

THE CHERRY--Cerasus.

History—Wholesomeness—Cherry Gum—Timber—Varieties—Culture—Cooking and eating.

Recipes.—Cherries Stewed—Pie — Ambrosia — Frosted —Dried.

CHERRIES are ripe! The first tree-fruit of the season holds out its ruby lips for the kisses it will be sure to receive most freely, and its coming seems to open the hearts of all who have anything to do with it. Indeed, by its own very abundance, it sets the fashion of bountifulness, and shames the niggardly into opening their hands. To all others it gives the coveted means for abundant giving. Friends send salutations to friends, neighbors to neighbors, of the tempting fruit. The older residents embrace the suitable opportunity to send to recent comers their kindly greetings. Employers make up "cherry parties" for employés, young people meet with their seniors in smaller parties, the boys are made useful in climbing, to their great delight, and send down abundant treasures into waiting baskets; torn trousers are indulgently overlooked; and even peccadilloes grow less, and the greedy boy grows gentlemanly when he finds his appetite for cherries recognized, and he is served with his elders, and a liberal supply is given him to take home. What a God-send the cherries are, to be sure!

Let us take our dessert dish of cherries

out under the trees this warm day. How cool and nice they are, and with the dew on them yet! Well, let it seem so if it may; but, to tell the truth, the dew came from the ice-room, where they have been standing for the last hour. These are the soft, sweet, dark ox-hearts, and the showy, firm-fleshed Bigarreaus, so called from their mottled colors. These are not native fruit, though we have several kinds that are natives. In this respect cherries differ from pears and apples, for there are several species quite distinct from each other, which can not be hybridized successfully. The choke-cherry of our forests, which bears its fruit in racemes, will not mingle with that which bears its fruit in clusters, even so far as to admit of intergrafting. We have besides this, two or three other kinds of wild cherries, some of which are a little more manageable than the choke-cherries, but all the cultivated kinds came from Europe, and have long been under cultivation.

HISTORY.

Mithridates, a physician and king of Armenia, about the year 100 B. C., is reputed to have first cultivated the cherry, and brought it to a worthy state of perfection. He was not, however, of so amiable and benevolent a disposition as we might expect from such peaceful pursuits, for, becoming restless under the Roman rule, he planned to free himself from it by rebellion, and the assassination of every person of Roman birth or extraction on the peninsula. The slaughter was horrid, and, of course, it brought down upon him the vengeance of Rome, whose legions marched forthwith against him and prosecuted a most destructive war, in which 155,000 of the Armenians perished. Lucullus, on his return to Rome, enjoyed a splendid triumph, and of all the rich spoils, from which, as victor, he was entitled to choose, he selected Pontic cherries wherewith to deck his triumphal chariot.

There is doubt whether cultivated cherries were known previous to this time, but this certainly brought them into prominence, and probably introduced a new and more valuable variety than any with which they were previously acquainted. There had been, certainly, abundant wild cherries in Europe, and it is by no means certain that the Mithridatic cherry is the progenitor of all our cultivated cherries, though Lucullus has the honor of giving the cherry its first permanent introduction to Rome. It is possible that the red sour cherry was that which was thus introduced; for the black cherry is found growing universally in the woods, and as thriftily as the oaks and beeches by which it is surrounded; while the sour cherry is found wild only in the vicinity of human habitations.

This black cherry was a great favorite among the poorer classes, who used it stewed with a little water and ate it with their bread. They not only used it thus while fresh, but they dried it on boards in the sun or in ovens, and thus they had a supply for the whole year. So highly was it prized for this purpose, that a law was passed in 1669 for the special protection of the cherry trees in the royal forests. In consequence of this they multiplied to so great an extent that they bid fair to occupy all the woodland. Then another law was passed quite ignoring the wants of the simple poor, commanding that a certain small number of trees only be exempt from destruction for the sake of their timber. Cherries, however, still abound in the fatherland, and they are eaten freely, stewed with sugar and water, slightly thickened with flour. Avenues of the trees are planted along the roads in Germany and in Switzerland. One such avenue extends from Brunn to Olmutz, a distance of sixty miles. One traveler speaks of journeying all day in another such avenue from Strasburg to Munich. This is partly the result of Governmental regulations, though the trees are planted by the owners of the contiguous farms. As much of the fruit as they wish is secured to them, if they but indicate their wishes to that effect, by tying a wisp of straw around a prominent branch of the tree they wish reserved. That would be a small protection here, where cherry trees are scarce, but there, where the gatherer would only be obliged to walk a few steps further, he might well afford to respect it. Perhaps we might enjoy the

same immunity here, if we tried the same means.

In some places this fruit has various pleasant associations connected with it. At Erfurth, where they have large cherry orchards, they set apart one day in every year, when the fruit is ripe, for a cherry festival. At Hamburg they observe an annual "Feast of the Cherries." Troops of children carrying branches hung with the ripe fruit parade through the streets with joyful cries. This is said to perpetuate the memory of an event which occurred in 1423, when the city was threatened with destruction by the Hussites. All the children in the city between the ages of seven and fourteen were sent out clad in mourning to ask the clemency of the conqueror. The hostile General was so touched with the sight that he granted their utmost request, feasted them with cherries, then ripe, and sent them home laden with that fruit and crying: "Victory, victory."

WHOLESOMENESS.

Cherry festivals are also held in some parts of England, and, indeed, we may safely say that cherry time is looked forward to by all the young people everywhere as a joyous season. Some of them, indeed, are obliged to put on long faces, for the barbarous days are not quite gone, in which they are condemned to hear the ditty:

"Cherries are ripe! cherries are ripe!
But baby can have none!"

If they never feed the children anything worse than cherries, the poor innocents, would escape many a gripe to which they are now subject, even in cholera times. There is no doubt that children suffer from eating partially ripe fruit, and especially from overeating the ripe fruit. Cherries come so early in the season, and are so temptingly abundant, that they are obliged to bear loads of guilt which do not properly belong to them. Similar remarks, it is to be feared, might also be ventured in behalf of some older people. More than most fruits the cherry is taken "between meals," as if it were so good that the temptation to partake could not be resisted. It is served fresh at meals much more rarely than most of the berries; and though it is beginning to be common at desserts, yet that is a poor time to test its wholesomeness, since the stomach is usually already filled, if not loaded. So it happens that the fruit has obtained a bad reputation, being accused of faults which belong much more to man's greediness. If people should eat them throughout the meal, as they do other food, and not overeat, any more than they do of other food, we should hear far less than we do now of the unwholesomeness of cherries. We should not expect that they would agree so well with those who are not free and habitual fruit eaters. A man who has fed largely on the flesh of animals, and saturated his tissues with their fat until it oozes out from all his pores, and the gastric juice of whose stomach has been obliged to adapt itself to the digestion of such food, can not expect that he would, under the same conditions, be able to manage a stomach full of cherries. But I believe that almost every man in ordinary health, who has been accustomed to a hygienic diet, could eat a full meal of cherries, especially of those which are sweet and ripe, and feel very comfortable after it. He doubtless would be hungry sooner than if he had eaten some good Graham bread with them, but with that it would be an easy matter to make him feel quite comfortable until the next meal. The sweet cherries are more nutritious than the sour, containing, in extreme cases, one-fifth more solid matter.

Stone fruit generally has the reputation of being less wholesome than pip fruit; but while we allow that the latter may be more freely eaten by invalids, we are decidedly of the opinion that to those in health it makes no material difference. Some writers very seriously warn against swallowing the stones. Dr. Pereira considers it worth his while to say that he has known fatal enteric inflammation produced by the accumulation of cherry-stones in that mysterious *appendix cæci*. I will not be barbarous enough to say that it is of very little importance whether people who indulge such practices live or die; but I will venture to express my belief that we are now so far civilized that no such caution will be needed.

CHERRY GUM

is the sap of the tree that exudes usually through some wound. In some respects this gum resembles gum-arabic. It can be used in the arts for similar purposes. But it should be prepared with boiling water, as it is only partially soluble in cold water. Its nutritious properties have been highly extolled, and some wonderful stories are told of its power to sustain life in the absence of other food They are, however, of doubtful reliability. We believe that science itself has not yet decided that gum is nutritious in the human system.

This gum being the sap of the tree, its loss is always a severe tax on the tree, which in health must be wounded in order to obtain it; and wounds on a cherry tree are always to be avoided as much as possible, as they are difficult to heal. Age, disease, and deficiency of nourishment may all of them produce the gum.

The cherry is one of the few fruit trees whose wood is in much demand for

TIMBER.

In Paris it is extensively used for furniture, being considered second only to mahogany. In this country there are several other woods which outrank it, though there is a Virginian cherry tree which is very handsome. In former days cherry was much used for tables, and our grandmothers thought one or more cherry tables indispensable to their outfit. For coffins it has been much used and is still in demand. For light pieces of cabinet work it is very pretty. The boys will find it very easily managed for brackets, and much more satisfactory than staining wood to make it resemble black-walnut. For lap-boards and drawing-boards it is very pretty and convenient. I have a small drawing-board, presented me by a country cabinet-maker, only a quarter of an inch thick, which I find extremely useful for many purposes. A set of little brackets, from the same source, which I fasten up at the sides of my window, to set my flower-pots upon, are very useful, and enable me to make my windows look exceedingly pretty. By the way, this arrangement of flowers is as pretty in many respects as that of hanging-baskets, while it is less expensive and far more convenient.

VARIETIES.

The two great divisions of the cherry are the sweet and the sour. Others divide them into Mazzards, Bigarreaus, Dukes, and Morellos. The first are the sweet, heart-shaped fruits; the second, the light or speckled, firm-fleshed fruits. The Dukes are sweet and melting, and the Morellos are the rich, but acid pie-cherry. The Kentish pie-cherries, which have long been famous in England, belong to the latter class. There are not so many varieties as of the apple and the pear, about three hundred being all that are ever reckoned in the most elaborate fruit-books. Since the trees are mostly grown from the seed, and these very much inclined to sport, the indications are that this fruit has not been as carefully looked after by the amateurs and fruit-lovers as some others. This may be partly accounted for by the fact that it is a temporary fruit, not capable of being kept so long as the later and more solid fruits. Nevertheless, it is sufficiently valuable to deserve much more care than it gets, and if people devoted some of the time to this which they now give to tobacco and some other worse than worthless things, the poor of our large cities might get a much larger supply than they do of wholesome fruit, and greatly to their dietetic advantage. It is true that it would require more care in the boxing and shipping than it now gets, in order to ensure its longer keeping, but these difficulties are not insurmountable. To those who object that half-decayed cherries are unwholesome, while we admit the fact, we reply, so is tobacco, and yet people do not seem to think that any serious objection to having it placed in the market.

CULTURE.

The cherry is a hardy tree, and flourishes better in the North than in the South. A sandy or gravelly soil suits it best, and these are not difficult to find. But it is very impatient of wet, and if the situation is low, or the subsoil holds water, do not put your cherry-trees in any such locality if you wish to keep them and gather fruit from them.

The Morellos will do very well on a clayey soil. They are usually grown from the seeds of sweet sorts, the trees being of stronger and taller growth. The acid sorts are usually grafted on these stocks. Cherry-stones intended for propagation should not be allowed to become very dry. When well cleaned, they may be packed away in moist sand, where they should remain freezing and thawing until spring, when they should be planted out in light soil as soon as the frost is out of the ground. They will come up during the first warm weather. They should be in rows, not thick enough to crowd each other, and be kept clear of weeds. The next spring they may be transplanted. About midsummer bud them with the sorts which you wish them to bear. When two or three years old, transplant them where you wish them to grow—all about your house, in your yard, and along the roadside. It is well to begin to set a good example; some one must be first. Perhaps by unvarying kindness, you may train the boys so that they will at least not break down the trees when they are gathering the fruit; and by offering them a good percentage for gathering, you may show them how much better it is to get their fruit honestly. Further, it would be a good plan, after you have learned how, to keep some young trees on hand, and sell them to the boys for little errands they can do for you. Nothing will sooner cultivate the barbarian out of them than to set them to cultivating fruit trees of their own. The same might apply to other fruits, and one man can thus, by tact and kindness, often recast the entire bent of the community in which he lives, and others, seeing how easily it may be done, will go and do likewise. I fear that we do not sufficiently consider that other people's children are in no small degree our children also; and that we have a very great responsibility for their proper education. I am very certain that neither parents nor other people see sufficiently the advantages of educating the young by giving them actual information about things of this sort that they might do, and which would be at the same time of real money value to the community, and a still greater value to the world, because of the enterprising men that it would produce. Why not take advantage of a boy's love for cherries to help make a man of him, rather than to let that same taste drag him down to, perhaps, a felon's doom?

COOKING AND EATING.

"Cherries are better to be eaten without cooking," says a critic. Granted. Pick them on the stems, pile them up on the fruit-dishes, and eat them with your food, without dressing, all you wish of them. Send some to your neighbors, dry all you have time to dry, can all you have time to can, and yet you will have some left. Moreover, to-morrow is Sunday, and you would rather rest than to go out to pick more; besides, you wish for variety, and I see no reason why you should not cook some cherries if you wish to. You may stew them with golden dates, if you object to using sugar; you may make them into pies; and better still, into ambrosias. The very first ambrosia I ever made was with cherries, and it is difficult to find anything better now, if you can be deliberate enough not to break your teeth on the cherry-stones. If the sour sorts require too much sugar, use the sweet; if these do not give you flavor enough, mix the two. Suppose we try some of these things.

RECIPES.

STEWED CHERRIES.—Strip the cherries from the stems and stone them. (By the way, I hope you have that ingenious little machine called a cherry-stoner). Place them in a porcelain-lined saucepan, with a small proportion of golden dates, finely chopped, and water enough to cover them. The relative proportions vary with the degree of acidity of the cherries, so that no exact directions can be given. At first it might be well to stew them separately, and then mingle and barely scald together, and you will soon learn to judge for yourself. Serve cold. The common Barbary dates would impart a flavor disagreeable to most people.

CHERRY PIE.—Make a crust with fine oatmeal, wet with one-fourth part water, or any other crust that you prefer, place the stoned and scalded fruit in it, with juice enough to nearly cover it; sweeten with granulated sugar, or with chopped and stewed golden dates, and bake fifteen or twenty minutes in a good oven, being careful not to scorch the crust.

Another way is to stone the cherries and press

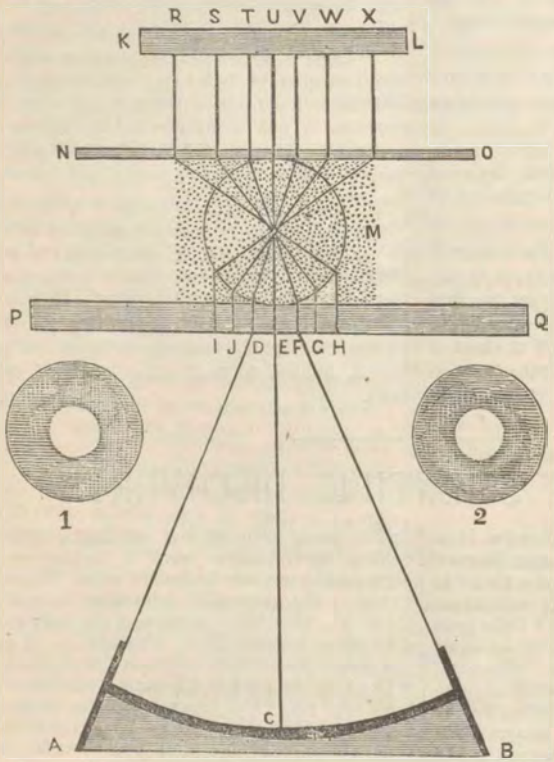
them as solid as possible into the crust; sweeten and spread over them a thin batter, made of Graham flour and water, spreading it down barely to meet the lower crust, leaving some breathing places, and bake half an hour.

CHERRY AMBROSIA.—Stem the cherries, but do not stone them. Make a batter with water and good Graham flour, quite as thick as for gems, and with this line a deep nappy that has been well oiled; place a layer of the unbroken fruit on this, sweeten, and sprinkle in a very little Graham flour, not enough to hide the fruit, not more than a heaping teaspoonful in a large nappy; then put a little more of the batter around the edge, another layer of cherries, sweetened, and lightly sprinkled with flour, a little more batter at the edges, and another layer of fruit, and then cover this with a thin layer of batter, leaving vents for the steam around the edge, so that the juice will not run over. Observe all the directions carefully. Rightly made, this is a wholesome and delicious dish, but most people spoil it in making it. They think it will do just as well to stone the fruit, or stew it, or they will "just try it" in a pie-dish, or they do not bake it sufficiently. By the way, it should be delicately browned, top and bottom, the fruit perfectly cooked in from thirty to seventy-five minutes, according to the size and the heat of the oven, and then mind if you let the juice all run out, it will be dry and tasteless. Serve warm or cold. If warm, it will be a little tough; if cold, cover it while cooling with a light tin cover to soften the crust with the steam. Many prefer it the second day. After that it is likely to become dry.

FROSTED CHERRIES.—Beat up the white of an egg; have a strip of strong pasteboard with slits in it about an inch and a half apart; have ready large dark cherries, of a good flavor, on the stems; dip them lightly in the beaten egg, and then slip them into the slits of pasteboard, stems down, fruit up; then sprinkle the fruit with pulverized white sugar from a castor, and place in a good current of warm air, where they will dry quickly. Serve soon for dessert.

DRYING CHERRIES.—They are a little nicer to be dried without the stones, but this makes no small amount of work; so after drying all you have time to dry in that manner, and canned all you care to, put in a larger amount still to dry unstoned. They should be large and good, so that they shall be worth drying, and there will be enough on the stones to pay for eating when they are stewed. They make rather deliberate eating, but if they are carefully dried and kept, they make a sauce of very agreeable flavor, particularly refreshing in the spring. In spite of the prejudice against the stones, they are much patronized at public and private tables, and preferred, indeed, to most other kinds of dried fruit.

JULIA COLMAN.



RECORD OF SCIENTIFIC DISCOVERY.

A New Element.—The scientist Hermann has announced, in the German *Journal of Chemistry*, the discovery of a new metal in material found at Haddam, Ct. It is obtained from tantalite, of which it forms a little over six per cent., the rest being metallic acids of tantalum, niobium, and ilmenium. Hermann calls it neptunium. He has so small a quantity of the material at his disposal that he has been unable to reduce the oxide to a metallic state. With soda it colors microcosmic salt golden yellow. It is the first element discovered for many years by mineral analysis, although in the past seventeen years five metals—cæsium, rubidium, thallium, indium, and gallium—have been discovered by spectrum analysis. The atomic weight of niobium is 118.2, giving neptunic acid the formula $Np_4 O_7$.

A Prize from Egyptian Antiquity.—A large roll of papyrus, covered with inscriptions, was discovered some twenty years ago under the floor of an old tomb in Thebes. It was 139 feet long by 16½ inches broad, and looked something like a stair-carpet. Mr. Harris, the lucky finder, bought it for a comparatively low price. His daughter, Miss Harris, felt convinced that it was a treasure, and to make sure against accidents, set herself to the immense work of tracing every sign and letter on it upon a paper of equal extent. She succeeded in making a fac-simile of it. Her father died, and the lady took a house at Koumel Dyk, Alexandria. A few years ago an explosion occurred in the house, which was reduced to fragments. Of its contents the two chief treasures alone escaped unharmed—the papyrus and Miss Harris herself. The great Egyptian archæologist, M. Brugsch Bey, examined the papyrus and told the Khedive of its great value, and the Egyptian Government offered the sum of £2,000 for it. But Miss Harris would not part with it. She brought it to England, when the British Museum purchased it for a larger sum, and from that time to this, Dr. Birch and his corps of Egyptologists have been deciphering it, while scribes have been engaged in copying it. It proves to be a complete record of the life and works of Rameses III., and a statement of the condition of things at Thebes three thousand years ago.—*Bibliopolist.*

Structure of Blood Corpuscles.—Although the term "blood disk" is still employed in authoritative quarters in describing the red corpuscles of animal blood, its

propriety is very questionable. The determination of this question resolves itself into this: "If blood corpuscles are really flattened bodies, each having a luminous spot in the center, as they are usually figured, then the term "disk" is admissible; if, on the contrary, the luminous spot and the disk-like appearance are purely optical phenomena, then there is no propriety in describing them as disks." That both these properties are optical illusions, not real elements of structure, appears to follow conclusively from a consideration of the simple law of optics illustrated in the diagram, namely: That when a ray of light passes from a refracting medium of lesser into one of greater density, it enters

Blood Corpuscle Structure.

the latter at right angles to the plane of its surface. For instance: if a sphere of solid glass is fitted into an aperture in a dark screen, and the light of a gas jet is directed upon it, each ray is refracted towards the center of the sphere, and as all the rays meet at that point, a perfect representation of the jet is presented within the ball. The blood corpuscle illustrates the same law on a minute scale. In the diagram, which follows the course of the illuminating rays from the mirror to the object glass of the microscope, M is supposed to be a vertical section of a blood corpuscle at 3,000 linear; P Q, a section of the glass slide upon which it rests; N O, a section of the cover; A B, a section of the concave mirror; K L, a section of the inferior surface of the object-glass; A D V, B F T, and C E U show the course of the illuminating rays, reflected from the mirror, passing through the slide, through the corpuscle, through the glass cover, and finally entering the object glass. I X, J W, G S, and H R show the same phenomenon, but are not continued downward to the mirror. A ray of light impinging on the mirror at A, and reflected, travels upward and inward to D, where it comes in contact with the slide, enters it at right angles to its plane, and continues to travel in the same direction until it comes in contact with the envelope of the corpuscle. Here it is again bent from its course, passes through the center of the minute body, and resumes its perpendicularity to the plane of the slide on entering the cover. It thus follows that the rays of the pencil that serves to illuminate the corpuscle under observation all cross each other, at or near its center, forming a sheaf of light, and producing the luminous spot so frequently described. The large luminous ring exhibited when the corpuscle is viewed beyond the focal distance, is caused by the dispersion of the light after the pencil has passed the center of the corpuscle. To demonstrate, experimentally, that the foregoing remarks are well founded, the scientist has only to test them with a microscope having a delicate hair adjustment. At 600 diameters — a very medium power for such observations, bring a special corpuscle, selected for study, into the center of the field. Having done this, lower the tube until the corpuscle disappears; and, on raising it slowly with the hair adjustment, a small luminous ring first comes into view. This gradually merges into an intensely luminous point, as the elevation of the tube continues. Finally, the luminous point gradually expands into the upper and larger luminous ring. The less firmly the cover is pressed down, the larger will be the luminous ring with which the observation terminates, but it will make no difference with the first ring that comes into view, or with the brilliant point that follows it. Cuts 1 and 2 show the relative proportions of these luminous rings at 2,500 diameters. This experiment conclusively verifies the hypothesis illustrated in the cut, by following the pencil of rays in detail through the corpuscle under inspection. The dispersion of the rays after they have crossed is corrected by the cover;

hence the difficulty that attends the study of animal blood with the cover omitted. The latest German authorities, particularly Hermann, concede the fact that blood corpuscles are not flattened bodies in their earlier stages of life, but hold that they become so at a later period. It is probable, however, that the flattened appearance of the aged corpuscle is due to the greater thickness and density of the envelope. With my best glasses and a low light, I have never yet viewed a corpuscle, old or young, that did not resolve itself into a simple globular body, perfectly transparent, enveloped in a thin membranous sac, which is the seat of color.—*F. G. Fairfield.*

Do Plants Think?—Some interesting data with regard to the movements of plants are published by the *Scientific American.* These movements often assimilate mental action, and are certainly very interesting subjects of observation.

Darwin has observed in the *Drosera rotundifolia* a faculty for selecting its food, which in animals would be attributed to volition. Mrs. Treat has described the same trait in the plant. On being deceived by means of a piece of chalk, the Drosera curved its stalk glands towards it, but immediately discovering its mistake, withdrew them. The plant would bend toward a fly held within reach, enfold it, and suck its juices; but would disregard the bait if out of reach, showing not only purposive movement (or a refusal to move, as the case might warrant), but also a certain power to estimate distance.

Again, Darwin has shown that the more perfect tendril bearers among climbing plants bend toward or from the light, or disregard it, as may be most advantageous. Also, that the tendrils of various climbers frequently attached themselves to objects presented to them experimentally, but soon withdraw on finding the support unsuitable. He says of the *Bignonia capreolata* that its tendrils "soon recoiled, with what I can only call disgust," from a glass tube or a zinc plate, and straightened themselves. Of another Bignonia, he says that the terminal point of the tendril exhibits an odd habit, which in an animal would be called an instinct, for it continually searches for any little dark hole in which to insert itself. The same tendril would frequently withdraw from one hole and insert its point in another. In like manner, spirally twining plants seem to search for proper supports, rejecting those not suitable.

Speaking of phenomena of this sort, Dr. Lindsay makes this strong remark: "In carnivorous and climbing plants there is a choice or alternative between action and inaction, acceptance or refusal; and the choice made is not always judicious. There may be an error, and the error may be corrected; but in order to such correction, there must surely be some kind of consciousness or perception that a mistake has been committed; an exercise of will in making further efforts at success, and a knowledge of means to an end, with their proper adaptation or application."

According to Professor Laycock, organic memory is common to both animals and plants, and certain *lianas* seem to exhibit it in a marked degree in their antipathy to certain trees. The botanist Brown has remarked that the trees which the *lianas* refuse to coil around are physically incapable of supporting the climbers.

In many cases, observers are, no doubt, self-deceived, and mistake a mechanical and wholly unconscious mimicry of intelligent action for an actual exhibition of intelligence; still, such men as Dr. Gray and Mr. Darwin are not apt to be deluded by mimicry or figures of speech; and however much it may run counter to popular notions of what is proper to plant life, the hypothesis that intelligence does not end with animal life seems by no means inconsistent with a multitude of trustworthy observations.

AGRICULTURAL HINTS.

[The mind is the man. Farming, in the highest sense, is not simply doing the hard work necessary. This can be done by muscle when directed by brains. The true farmer is he who can plan, direct, and control skillfully.]

As this department is one which should contain the most recent gleanings of wisdom and experience, our readers and friends in the rural districts are invited to send us any items of value to agriculturists in general, and which should have a wide circulation. Due credit will, in every case, be given to the contributor.

An Idea for the Housekeeper.—Put into a cup of common alcohol, such as is used for spirit lamps, as much gum camphor as it will absorb, and wash any part of the house or beds that has been infested with bugs. It will kill the bugs and destroy the vitality of the eggs if every spot where they have been concealed is thoroughly saturated with this mixture.

A Simple Weather Sign.—If you don't happen to have a barometer about the house, watch your grass clothes-line stretched across the yard. Whenever the sun shines and the air is dry the line will slacken and hang down, but if there is moisture in the atmosphere, it will contract and tighten up until it will sound like a drum if struck.

Agricultural Humbugs.—An exchange waxes strong on this point: "If the money which is annually lost by farmers upon various kinds of humbugs which come in their way could all be exhibited in one gross sum, its total would, no doubt, surprise us all. A party advertises seed-corn which

will certainly yield one hundred and twenty-four bushels of shelled corn per acre. Plenty of buyers are found at an exorbitant price, who fail to think that this yield, if produced at all, was only obtained from very rich land, at the expense of manure and labor, often supplemented by sharp arithmetical measurement, and that this seed is no more likely, under any circumstances, to produce a larger crop than other sorts in the neighborhood. Wheat, from the crop of an Oregon wild goose, which will certainly yield fifty bushels per acre, finds buyers (or at least, we may judge so by its being extensively advertised) at fabulous prices. Oregon wheat land is noted for its immense crops, but seed from these fifty-bushel crops will not produce as much per acre *here* as our own common seed. In time, public opinion will set this matter right; but, meanwhile, much hard-earned money will be lost by men who ought to know better. A good standing rule to observe in all such cases is to let them alone. An old farmer once advised his son to beware of "all new things, for there can be nothing new and good at the same time."

American Potatoes in England.—It is said that the English people go into ecstasies over some of the American varieties of potatoes; and we do not wonder at it, if they have nothing better of the kind than those we have seen from abroad. At the saloons of our city, imported French potatoes have been served to customers for several months past; and, while some of them are dry and mealy, they are mainly of a yellowish color and rank odor. A few days since, we saw a few sacks of "genuine Irish potatoes." They were coarse, black-looking bulbs, thick-skinned and deep-eyed, and the reverse of attractive.

Manurial Value of some Waste Products.—Professor Storer, of the Bussey Institution, has made some valuable investigations in regard to the manurial value of leather chips, roasted and raw, and he has also bestowed considerable research upon spent dry woods and tan, with the view to ascertaining their value by analytical results and practical experiment in the field. A popular error has long prevailed that the spent sumac and logwood from the dye-houses possess value as plant food, and notwithstanding we have on several public occasions denounced its employment, it is still sold to farmers, and by them applied to their fields. Leather chips have been less in favor; still, they have in the raw state been considerably used in those sections where the shoe-manufacturing interests prevail, which industry gives rise to an abundance of the chips.

The extended researches made go to prove conclusively that leather, in either the raw or the roasted condition, has no good influence upon plants, but rather the reverse. By roasting, a trifling amount of the nitrogenous principle is given up in the soil but not enough to render the material practically of any value. Spent sumac, logwood, oak, and hemlock barks are not only perfectly worthless as fertilizing agents, but they are positively deleterious. The only value they possess upon land is as a mulching to be placed around trees and shrubs to protect them from drought It may not be advisable to use them freely for such purposes, as the acid elements they contain may injure delicate plants. It is better for farmers to let these waste substances alone; they are not worth their attention.—*Journal of Chemistry.*

Take Care of the Toad.—The *Ohio Farmer* well remarks that the number of insects that a toad will eat is almost incredible. A few of them in a garden will keep it well rid of bugs, plant-lice, etc. They generally spend the day in some dark, secluded spot—often a hole under a sod or clod or the side of a rock, and in the evening they come out and hop about in search of a supper of live insects. They may be induced to take up their residence in the garden by confining them for two or three days to the place, when they will become quite well contented. A board laid about two inches from the ground is just the kind of a hiding-place that suits them. They are long-lived, being often known from twelve to sixteen years old, and it is said one lived to be thirty-six years old. On account of their propensity for destroying insects, toads should be encouraged to become permanent residents of our fields and gardens.

An Item in Grape Culture.—Here we would mention a fact which has come within our observation and experience, which, if generally true, is of some importance. It is this: That the third fruit-bud from the base of the past year's cane throws out larger and better developed bunches of grapes than either the first or second. The grapes from these buds seem also better flavored, and generally superior to those on the first and second. In accordance with this hint, we have adopted the plan of cutting the cane at such length as to leave the third bud, generally, and sometimes the fourth, when a good strong one, and then rubbing off the first and second buds, and leaving the third and fourth for fruit.

The number of fruit-buds left on any vine must depend on the age and strength of the vine. If the vines are strong and vigorous at three years, from two to three bunches of grapes may be allowed to mature on each, without injury. The next year the number may be increased, and so on, increasing the quantity of fruit with the age of the vine.—*Pacific Rural Press.*

If milk be introduced into bottles, well corked, and put into a pan of cold water, and gradually raised to the boiling point, and after being allowed to cool, be taken out and put in a cool place, the milk may be kept perfectly sweet for half a year.

MRS. C. FOWLER WELLS, *Proprietor.*
H. S. DRAYTON, A.M., *Editor.* N. SIZER, *Associate.*

NEW YORK,
JULY, 1877.

NATIONAL REFLECTIONS.

WITH the recurrence of July the patriotic sentiment of the American experiences an awakening. Especially is this the case in late years on account of the centennial anniversaries of the deeds of prowess and glory which illuminate the record of our country's early life. Last year we celebrated in a manner fit to "go down the ages" the Centennial of our nation, and six years more remain, each of which will probably be made interesting because of its Revolutionary memories. The operations of the colonial forces against the armies of England were attended mainly with disaster in 1777, so that had it not been for the victory at Bennington in August, and the surrender of Burgoyne at Saratoga in October, the prospects of the patriots would have been shrouded in the deepest gloom. Our friends of Bennington and of Saratoga may hail the days which commemorate these important successes with a very earnest enthusiasm, for they, like the battles of Trenton and Princeton, which were fought in the winter previous, awakened the spirit of hope when despair had almost settled upon the American heart. In June, 1778, occurred the evacuation of Philadelphia by Gen. Clinton with the British army under his command, and in the same month Washington fought the battle of Monmouth, which hastened Clinton's retreat to New York. In 1779 occurred the brilliant capture of Stony Point, on the Hudson River, by Gen. Wayne, and the evacuation of Rhode Island by the British. The year 1780 was occupied mainly with indecisive operations in the Southern States, the Carolinas particularly, where the enemy had very successfully intrenched themselves. North Carolina can, however, find some material for congratulation in the affair at King's Mountain, where a regiment of militia utterly routed a detachment of Cornwallis' army, although of greatly superior numbers.

Early in 1781 Gen. Morgan won the brilliant victory at Cowpens, South Carolina. In September the battle of Eutaw Springs took place, which had a decisive influence upon the fortunes of the colonies in the South, and being followed soon after by the surrender of Cornwallis at Yorktown, Va., the success of the American arms was made certain. Then in 1782 we have the evacuations of Savannah and Charleston by the foe, and in 1783 the formal treaty of peace and recognition of American independence by Great Britain, which was followed by the withdrawal of the last of her army from New York in November of the same year.

Who that looks over this broad and beautiful land can wonder that England relinquished her claims to it only after a long struggle and a costly expenditure of men and money? There were wise men among her counselors, who foresaw the growth and power of the American colonies—they certainly did not imagine the full extent of our development—and could not entertain the idea of losing so important a part of

their Empire. But the war once begun, developed the strength of the infant nation, and proved, in accordance with Lord Chatham's declaration in Parliament, the invincibility of America.

We would ask our orators and public men to whom it is given to perform leading parts in these centennial celebrations and patriotic demonstrations, to be bold in indicating the weaknesses in our public polity and social order, and to exercise a true wisdom in giving counsel for the correction of abuses in legislation and for the establishment of a true fraternity and loyalty throughout the land.

Let the lessons of our past instruct us in the present. Let all the people in all sections co-operate for the general welfare, forbearing strifes, factions, animosities, and rancor, which, persisted in, tend to undermine the solidest fabric of nationality. The various elements in our population may, under careful guidance, be made conducive to a powerful unity, which, like conglomerate rock, may resist the wear of ages.

Let there be among us as individual citizens less of selfishness, less of the desire for personal exaltation, and more of generosity and the disposition to help the weak and educate the ignorant, and we shall make a decided step toward realizing true liberty and union.

SPRING-TIME INDISCRETIONS.

IT is estimated that one-fifth more persons die in the spring months than in the autumn. Much of this excessive mortality is due to the maladies which are still deemed by the mass of society incident to the change in weather conditions, whereas they are induced mainly by dietetic improprieties which have overloaded the blood with carbonaceous matter, and so clogged the excretory organism that with the incoming of a mild season and the disappearance of the bracing, stimulating cold weather, bilious disorder indicates the general systemic derangement. Of these particular mention has been made in other parts of this magazine now and then, and it is unnecessary to repeat them here. Our design just now is to allude to one or two causes of spring illness which are not minor in the number and variety of their melancholy consequences. With the first warm days of April many people, young and old, in the different walks of society throw aside their heavy great-coats, wraps, or cloaks, on the plea that they are "too hot," and go to their places of business, or to visit or shop, without them. We have met men in the early morning on their way to their offices or stores apparently rejoicing in their emancipation from the heavy "beaver" or "melton," little thinking that its need would be felt as they returned home in the chilly evening air, and still less realizing that this premature laying aside of a thick outer-garment is the cause of an incalculable number of pneumonias and "colds."

We have found it a good rule to continue wearing our winter overcoat until April is well advanced. After that, and until June, to wear a light or spring overcoat. As for exchanging our thick under-garments for thin ones we have not trusted to the almanac as a guide in the uncertain latitude of New York, but have always waited until summer has established her decided reign.

We know of people who have been in the habit of dispensing with fires made for warming the house at a certain time, say the 15th of April or the 1st of May, and as a consequence, when a cold storm occurs, or the winds from the ice- and snow-bound north-west prevail, shiver in their sitting-rooms whole days, risking to themselves and children severe attacks of disease. They

who are actively employed in the kitchen or out of doors may feel warm and comfortable enough, but they whose avocations require them to sit in a room without a fire soon become acquainted with the dispiriting influence of an atmosphere a few degrees below 68° Fah., which is generally considered the normal standard of human comfort. One hygienic authority declares that "furnaces should not be removed, nor fire-places and grates cleaned for the summer, until the first of June; for a brisk fire in the grate is sometimes very comfortable in the last week in May."

Houses which are located on low ground which is wet or insufficiently drained, are subject to dampness, which renders living in them unhealthful at any season without such means as an open fire. We have known people living in old-fashioned stone-houses, who were in the habit of making a fire in the grate of their sitting-room every evening, as a precaution against dampness. Modern houses, with their large and numerous windows and open walls and high cellars, are vastly superior to the old style in the important respects of dryness and ventilation, but care is necessary in the management of the heating, drainage, and ventilation of the best-planned residence if those insidious foes to family health, miasmatic emanations, would be altogether avoided.

THE CONTRAST.

ON the 15th of May last, the city of New York was the theater of two events, each of which claimed the popular attention, and preferred special reasons for being considered important in their several ways. For one there had been a long series of preparations. All classes had been called upon to contribute toward rendering it elaborate in display, and multiplex in interest and variety. It was designed at first, we were told, to subserve the purposes of popular jollification and of industrial illustration—the grotesque and funny were to be coupled with the practical and useful. For weeks the newspapers discoursed upon its characteristics, even promising great developments. Of course we are understood to refer to the so-called Carnival.

The other event had been given the merest notice previously. A few persons of culture had united to give expression to their admiration and respect for a man of genius and manliness, by erecting his statue in Central Park. The bronze completed, a brief item in the newspapers of the 14th, announced that the statue of Fitz-Greene Halleck would be unveiled the following day, with appropriate ceremonies, and that President Hayes, then visiting New York, had been invited to be present.

The character of the "Carnival" is known to the reader through newspaper comment. Early in the day, crowds assembled in Broadway, the main route of the procession, and waited patiently for hours, to be disappointed by a thin display of tinsel and vulgar costume, in which the equipage and votaries of the liquor trade greatly predominated. In fine, the impression derived by the intelligent spectator was, that the affair had been gotten up for the glorification of lager, and to feed the tills of the dram-shops.

But away up-town that afternoon, in the quiet, leafy mall of our splendid Park, occurred that other event which testified in terms of emphasis that a good proportion of our citizens esteemed solid worth above glitter and tinsel, for notwithstanding the little publicity which had been given to the affair, a great assemblage of men and women was there to welcome the new Chief Executive, and to give that grateful encourage-

ment to the special ceremonies of the occasion, found only in numbers. We were there, and can testify to the orderly and intelligent character of the throng. President Hayes appeared well pleased with his reception, and with the exercises, and gracefully performed the part assigned to him. The occasion proved a rare one for an out-of-door celebration, because of the many eminent men of national reputation in science, art, letters, and politics, who were drawn together, and the thousands who thronged the lawns and approaches to the site of the new statue, had the unusual opportunity to see these representatives of our country's best minds face to face. They returned to their homes, gratified beyond their expectation, and feeling that they had acquired something of moral value, something for their mental growth. While thousands of those who had spent hours of the day and of the night on the ridiculous buffooneries of the Carnival, wended their way homeward, tired and disappointed, feeling that they had lost precious time, and had received impressions, which, if tolerated, would lower and degrade their moral tone. FAILURE was the verdict of the public on the "Carnival." SUCCESS, the hearty and unanimous opinion of the multitude that had assisted in the commemoration of the poet Halleck.

AN EDITORIAL EXPOSTULATION.

ALMOST every day's mail brings to this office a package of manuscript from some young or inexperienced hand which the editor is requested, first, to examine with reference to its appropriateness for publication. So far, well. But there is a second request which is not so well in the editor's opinion, and which is usually couched in language like this: "If you do not deem the article fit for publication, will you be kind enough to point out its defects, and give me some advice, as I am," etc. Now, many of the writers of such a request expect a reply which shall pretty much cover the field of their defective authorship, and set them in the way of the much desired success; and if they do not receive it within a week or two, are inclined to berate the editor for want of sympathy, coldness, or something worse, and perhaps go to the length of talking down the quality of the magazine which, before, they had characterized with energy, as "one of the *best* published."

We know the tenderness of the youthful aspirant for literary honor, and how keenly the shaft of disappointment wounds, and are ready to make a liberal allowance for the indiscretions which may be committed under such a stimulus, however unreasonable may be its relation to us. The reader will affirm the statement that the editor of a periodical is not constituted by virtue of his editorship, the critic and reviewer whose services are at everybody's command *for the asking*, any more than are the services of the lawyer or physician. But most literary men, especially they who are connected with the management of weekly and monthly publications, frequently and generously accord hints and advice to inexperienced wielders of the pen, and this fact has had its influence, doubtless, in circulating the notion that an author's time and talent are a sort of public commodity.

It has always been our practice to treat all applications for advice and criticism with as much liberality as our duties would permit. Like most of our contemporaries of the "sanctum," our time is pretty well filled up by the regular work of reading and preparing matter for the press, and in the correspondence and almost endless detail of the editorial function, yet we are always ready to do what we can, and drop a word

or two for the encouragement of an earnest, striving soul.

We believe in helping one another—THE PHRENOLOGICAL JOURNAL has been conducted for twenty years or more on that grand principle, and its record as a helper if it could be declared to the world would be a proud one—but, friends, do not expect too much of us, for in the language of Dr. Holland, "eyes wear out, work presses, cares are many, every day brings its fatigue, and every evening its demand for rest."

AN EXAMPLE IN THE RIGHT PLACE.

WE shall have no reference to political questions or parties in what we are about to say, and we would not make any invidious comparisons. Let the reader comment or conclude as he pleases. Not long since a communication appeared in the *New York Tribune*, in which the following statement occurred:

"Alert, youthful as he was twenty-five years ago, he is a forcible example of the value of an abstemious life. He was never in a bar-room, it is said, in all his years. He is an utter stranger to tobacco in all its forms. Nobody ever saw him take a drink of liquor, or smoke a cigar, or chew tobacco."

The reference is to President Hayes, and the author of the statement asserted an acquaintance of twenty-two years' duration with the subject of it.

It is certainly a most extraordinary series of declarations concerning a man prominent in public life and politics for nearly half his fifty-five years. The list of American Presidents contains many names of pure and lofty manhood—characters that were examples of integrity and sobriety—but we do not remember one of whom it could be said that "he was never in a bar-room in all his years." Some might protest against this severe propriety of conduct as extravagant; but, for our own part, we can not help according it our hearty respect. What is the "bar-room" but the place where liquors of different grades of quality and intoxicating strength are sold by the glass? What is it, whether in the palatial hotel or in the corner grocery, but the rendezvous of the intemperate and impure? What are its influences? No one will claim anything elevating or ennobling in its associations and culture. The man who disclaims any concord with such a place is entitled to our esteem, and it is a matter of great satisfaction to know that our President takes so high a view of manly conduct.

As for the other items—his repugnance for tobacco and the use of liquor as a beverage—they are correlative with the one just noticed. We are very glad of this exhibit of the character and habits of our President for the sake of our youth, who look for their models of daily conduct to those who occupy the chief positions in government and society, and for the sake of the country at large, which needs the moral restraint which a temperate, upright, and healthy chief magistrate can not help exercising.

A GREAT MONOPOLY DEAD.

SEWING-MACHINES can now be purchased at prices approximating fairness. The patents which exacted large royalties from manufacturers have expired, and the field is open for free competition. The public will rejoice at the breaking down of the great combination which has so long ruled the sewing-machine trade and procured extortionate profits for the manufacturer and dealer. The magnitude of these profits is evident by the fall in prices which ensued immediately upon the expira-

tion of the last important or "foundation" patent, and which was equivalent to forty, in some cases fifty, per cent. on the old rates; so that a first-class machine which formerly commanded sixty dollars can now be purchased for thirty. Although appreciative of the great value of this wonderful device in our industrial life, we could not extenuate the course which compelled rich and poor to pay a price which bore an unfair relation to the cost of production. The fact that an article is of important use is not a valid reason that they to whom it is offered for sale should be compelled to pay several times its cost of manufacture. The management of the sewing-machine trade appears the more reprehensible because the high prices were maintained in great part for the benefit of agents and brokers, a discount of forty or fifty per cent. being given them by some manufacturers for selling machines. Efforts were made to obtain extensions of the old patents, but the public spirit and good sense of our Washington law-makers were too strong for the lobbyists, rejecting their importunity and winning the approval of the people at large.

Our Mentorial Bureau.

[In this Department will be noticed such matters as are of interest to correspondents and to the general reader. Contributions for "What They Say" should be brief, pointed, and creamy, to secure publication.]

To Our Correspondents.

QUESTIONS OF "GENERAL INTEREST" ONLY *will be answered in this department. But one question at a time, and that clearly stated, must be propounded, if a correspondent shall expect us to give him the benefit of an early consideration.*

IF AN INQUIRY FAIL TO RECEIVE ATTENTION *within two months, the correspondent should repeat it; if not then published, the inquirer may conclude that an answer is withheld, for good reasons, by the editor.*

WE CANNOT UNDERTAKE TO RETURN UNAVAILABLE *contributions unless the necessary postage is provided by the writers. In all cases, persons who communicate with us through the post-office should, if they expect a reply, inclose the return postage—stamps being preferred. Anonymous letters will not be considered.*

THE SQUIRREL AND THE MAN AGAIN.—Suppose a squirrel is on a tree and a man is on the opposite side of the tree—as the man passes around the tree the squirrel keeps on the side opposite to the man. Does the man pass around the squirrel?

Ans.—Yes! Suppose a horse be hitched to a cider-mill or brick-mill sweep. The opposite end of the sweep goes around the mill, and keeps opposite to the horse, but the track of the horse is outside of the entire mill, and of course he goes around it, just as much as if he travelled around without being hitched to the mill.

THE ARMLESS AND LEGLESS M. P.—In reply to a correspondent we would say that the armless and legless member of the British House of Commons is Mr. Irving, an Irish gentleman of considerable prominence. Four or five years since we published a sketch of him which was sent us from London by the late Mrs. Mowatt-Ritchie. Although born without legs or arms, he rides, drives, and does about all that most men do with their hands, while intellectually he has few superiors.

DENYING FACTS.—The anatomists and physiologists who are not conversant with the principles of Phrenology are very apt to make mistakes in attempted discussions of them. Not long ago, Professor Ferrier introduced to the British Society the results of his experiments in exciting the brains of animals by means of the Galvanic Battery. And then Dr. W. B. Carpenter was one of the first to say that these things confirmed some of the claims of the Phrenologists, and it was necessary to review his attitude toward our science. The facts of Phrenology are attested by observation. By the methods of inductive philosophy we place those facts against a world of denial. If you want the data of comparative anatomy look around you; consider the nervous structure of beast and bird, and compare them with man. A celebrated Physiologist of France devoted seven years to special investi

gations in comparative anatomy for the very purpose, as he avowed, of refuting the doctrines of Gall; but after examining something like three thousand subjects, he was compelled to admit that the testimony of nature was overwhelmingly in favor of Gall and Spurzheim. It would be well for scientific objectors to Phrenology to read Vimont's magnificent treatise—we have lately received a fine copy of it from Paris. Then as regards embryonic developments Phrenology has the objector there. All we ask is that you will study the gradual accretion of nervous matter in the germ, and see how part is related to part, how organ is built upon organ, how man is what he is by reason of additional departments of nervous function.

HEALTH LIFT—SPECIAL AFFECTION.—G. A. C.—The "health lift," under proper direction, is a good method of exercise in certain maladies. In cases of general debility, weak lungs, nervous irritation, dyspepsia, the "health lift" has been found capable of ministering benefit to the patient. Most people are indiscreet, however, in the use of the "health lift," if they attempt to practice alone. We think that no one should operate it without having taken lessons from some skillful teacher, or a physician who is thoroughly conversant with it. In local troubles, like uterine displacements, supporters are frequently beneficial; so too when the abdomen is in a relaxed or pendulous condition, owing to the weakness of the muscles; or when it is excessively fat. Such conditions intimate, indeed, the need of artificial support. Supporters like trusses should be adapted to the wearer; they can be obtained of surgical apparatus manufacturers; we frequently have occasion to supply them.

BATHING.—For persons in moderate health we deem the sponge bath as good as any, those only in robust condition should attempt the plunge. A quick sponge bath in a warm room, followed with a brisk hand-rubbing will be found very beneficial in toning up the system. An apparatus for bathing, which is admirably fitted for the use of those who have no special conveniences at home, can be obtained for twenty dollars.

SPIRITUALITY.—We think that the use of this organ in the direction mentioned by the inquirer, to wit, for communicating with the spirit world, is an abnormal adaptation of its functions. We hold that the influence of the religious faculties is one of an interior mental character, according to its degree purifying and ennobling the man, impressing him with deeper convictions of the reality of God and His providential relations to the world.

STORY MEMORY.—Z. T. L.—One who has special capability in memorizing stories and relating them is largely developed in the perceptive faculties of the intellect, Individuality and Eventuality, particularly, being large. There is also a good degree of Spirituality, Ideality Constructiveness, and Language.

DR. WINSHIP.—This celebrated "strong" man owed his death to the special cultivation of his muscles at the expense of other parts of the body. The muscles of his shoulders and the chest were greatly enlarged by his efforts to attain his Samsonian might, and the effect of the unnatural strain upon them was naturally a weakness in the action of the heart, possibly accompanied with an aneurismal condition.

SLEEP.—Sleep considered as the effect of weariness and the process for replenishing the nervous system with vigor can scarcely enter into the vocabulary of true faculties. The organs of the mind require sleep, as parts of the nervous system; just as the muscles when weary demand rest. The disposition to slumber, repose, in individuals is dependent upon their temperamental constitution and habits. A lethargic nature slumbers more than one that is active and lively. A man with a marked nervous temperament requires comparatively little sleep, for the reason that during his sleep the process of recuperation go on very rapidly; men with a predominance of the motive temperament require more sleep than those with a predominance of the nervous, because their circulation is slower and less thorough, and consequently the repair of the systemic waste is slower. Eating and drinking may be looked upon as the external process of alimentation, and therefore subservient to the mental organs which relate specifically to the economy of nutrition. We distinguish between Alimentiveness and the mere exercise of eating, as the organ is a part of the brain, and exercises a monitorial function in what may be termed the culinary department of human life.

SABBATH DAY.—The observance of the Sabbath was changed from the seventh to the first day of the week in Apostolic times. By reference to the New Testament, you will find that the disciples were accustomed to meet together on the first day of the week; and their example has been followed by the Christian world very largely. There are a few societies or sects who cling to the Mosaic or Hebrew idea of the seventh day for worship.

ADDRESS WANTED,—If J. M., of Worcester, Mass., will give a P. O. address for a letter, one will be sent.

What They Say.

WOMAN AND FINANCE.—In looking over the history of the past, we find many daring feats and grand exploits planned and executed by woman. Martha Washington and Mrs. John Adams, and many others, were called good financiers; and we read in history that "in the year 1705 Thomas Chalkley, a Quaker preacher, with other Friends, paid a religious visit to the Senecas and other Indians living about the waters of the Susquehanna. They were received with cordiality, particularly by a woman who was the chief speaker, and who was indulged in this because she was considered smarter than the men. She was also their Empress."

Woman has controlled armies and moved nations, and if we come down to our own civil war, we find many who promoted measures by which hundreds of thousands of dollars were placed in the hands of those who carried on the work of the "Sanitary Commission." Did any one think then of woman's financial status amid the roar of battle? In a boarding-school we were once familiar with, finding the financial part running behind, and being anxious for the life of the institution, the Principal, a smart, active woman, took all upon herself; went or sent to New York, purchased all pertaining to the kitchen at wholesale rates, and soon brought matters back to a solid basis. She had the supervision of the whole mental, moral, and physical welfare of the school besides, and was engaged in hearing recitations every hour but two during the day. For all this mental and physical labor, she was paid five hundred dollars and her board in the institution. A man would have had one thousand dollars or more, beside one or two assistants. In a few years she left. A man was hired to carry on the kitchen, distinct from the school, but was soon dismissed, because affairs were again running behind, and the discovery had also been made that he had "feathered his own nest." We do not know what salary was given him, but will warrant it exceeded that of the successful lady teacher. We have known instances where a family's honor and financial credit trailed in the dust while controlled by the husband, but when some event—dishonesty or death, perhaps—removed him, the wife rose nobly to the position, and in spite of all restrictions of sex brought up her little family, and sent it into the world well-cultured, mentally and morally, and all without creating at the end a financial crisis.

Woman is accused of extravagance. Admit it, and what would be the sure and only cure? We answer, give her a wider field of action, that she may have something better to think of. But is *she* alone extravagant? Are men *always* economical? Look at the millions that are yearly expended by them on fine mansions, public edifices, and in the furnishing and re-furnishing of business offices. Forty thousand dollars were expended lately in a certain State for furnishing two legislative halls—the curtains to each window costing seven hundred dollars. It costs, by printed reports, fifty thousand dollars to keep the Treasury building at Washington clean, and we know a young man who went there a few years ago and was paid a salary of twelve hundred dollars for keeping the windows of a certain room clean and watering the plants therein. But then we know men are such orderly beings, and so dislike to mix things, that there must be help at every post, no matter whether the whole time of each helper be consumed or not. Add to this the untold millions that are yearly chewed and smoked and drank up, with no possible result but disease and death.

Who thinks it improves or beautifies a human being to chew the cud or to have a pipe or cigar between his lips, or the wine cup in his hands? Were it not for these extravagances, our sons and daughters might be better educated, our schools and colleges better endowed, higher standards and nobler examples of moral and physical being be everywhere seen. But one will say, "I have none of these habits." Very true, and we thank God for the few men, noble and true, who have not made themselves brutes.

A strong temperance woman and a worker said to me the other day: "I have worked in the cause long enough to become fully aware that the reason why woman can do so little is because she can not control money. It is in the hands of husbands, and she, having no legal right to it, can only get a little dealt out to her now and then." Those of us who have ever circulated a subscription for some benevolent purpose, have many a time seen the hearts of noble women pained by their restricted purse. We heard Miss Livermore once say, in her lecture on "Superfluous Women," "Any wife who bears her own reasonable share in the home duties (and by this I do not mean those who are at once housekeeper, seamstress, kitchen-maid, and nurse, for that is too much for any *one* woman), earns her board and clothes, and has a right to them, and a good many dollars beside, in a year, else she is not fit to live with." Man could not and would not live thus restricted; secession would be a reasonable course, according to his opinion.

We would say, then, that woman is weak and inefficient, because both custom and law have helped to make her so. But now and then we find a weak, inefficient brother, and what excuse exists for him? Every woman, in whatever sphere she may be working (and let ability al-

ways govern her there, not anybody's preconceived notions), should have her fairly-earned share in the profits. Servility in the home, or anywhere else, is the product neither of justice nor love, and does not elevate or ennoble either man or woman. One half of the human race can not build upward at the expense of the other half. Make woman, then, a free and independent being; open all the avenues for her advancement, and trust the issue, as you did with yourselves one hundred years ago. It is for none to say what woman can or can not do. When our fathers battled for their freedom, did they foresee the vast amount of wealth and power opening before them? By no means. They fought for their own God-given right. But when we see our Florence Nightingale, Mary Somerville, Charlotte Cushman, Maria Mitchel, Mary A. Livermore, Mrs. Howe, Lucy Stone, and hosts of others, we lose ourselves in admiration at the accomplishment of so much with woman's fettered chances. On the other hand, we also wonder that not more has been accomplished by men, as they have had it their own way for a century, with no fetters, unless self-imposed.

Woman can be womanly wherever she is, whether behind the counter or the plow, in the pulpit or the home. There is a true womanly grace that goes with a noble woman everywhere. Only by sustaining this quality can she elevate public life. What a picture it now presents to us—its garments all tattered and soiled and stained. How can our brothers look us in the face and refuse our aid, with the terrible disclosures this closing century has brought to light, unless it is for shame they refuse, knowing we have to go down into the depths if we would help them.

The brothers of the Grange have wisely and generously allowed women liberty while there. But we ask it in our homes, on the street, and everywhere as well. We do not say woman would have made public affairs any better, but could she have made them worse?

H. E. WILLETT.

THE "CIRCULATING MEDIUM."—It is in the power of every person to produce some thing; and it is unchecked, free production and transmission that is wanted, not more gold. The only possible way that more gold could benefit mankind would be to have it found in quantities (opposed by both science and policy), to make it as cheap as iron, to break the iron rule of those who now check production and transportation by holding every other interest in tribute to the monopolists of that metal. If all were allowed to produce whatever of value they choose, whether it should be wheat or shoes, flowers, statuary, or ornaments, iron, silver, or gold, food, clothing, or implements, whichsoever the nature of their surroundings admitted, and do so untrammelled, receiving therefor (when stored in public warehouses) a certificate of its value (measured by a universal standard, made of some substance which is in itself of no intrinsic value, except as a measure of values), to be used as a circulating medium, this kind of money would relieve oppression and stagnation at once and everywhere, making universal plenty. To have this, there is no need of finding and coining the so-called precious metals, which are always difficult, laborious, and restricted by their nature and surroundings. Other things, as wheat, cotton, or iron, are really of more intrinsic value, and would be of far greater legitimate consequence and value, if allowed their just consideration, than either gold, silver, or diamonds. Of what value, besides an imaginary one, is the golden pavement of a New Jerusalem, compared with iron, Russ, or asphaltum, articles as common and cheap as clay in some places, yet articles of really more utility and value than the "precious" gold. Whisper it not in Gath, tell it not in Judea, that there are a thousand things that are of more value than gold; for upon the day thou tellest thereof, the name of master and servant must be abandoned, and some new and disgusting nomenclature adopted; for no one will bow down to us and obey our slightest behests, as now, and all will be equal, each having to serve himself or go unserved. No! Stop!! There is a coin that can be used, a coin of untold value. We will endeavor to describe it. A Nevada judge was lost in the mountains of Toyabe, and wandered for days without food and became delirious. In this condition he was found by a lowly, despised squaw; all her efforts were expended in endeavors to lead him in the direction of his home, to food and water; but in his delirium he struggled to go in the wrong direction, to the desert again. The wretched female savage ran miles for help to bring this human being succor. When she found it and returned, the Judge had wandered miles into the desert, and had sunk upon the sand and expired. Eventually his remains were recovered by his wife and friends, together with his gold watch and valuables, that were upon his person. They were untouched by the wretches who found the man; but another thing was found in the possession of this squaw—the coin mentioned. This poor creature was the possessor of a coin that would beggar an A. T. Stewart or a Rothschild to purchase—the coin of *universal good will and brotherhood*. With this coin—when it becomes current—can be purchased all that the wants of mankind in their sorest need and distress, may require and which can not be obtained by the other currency suggested.

Los Angeles, Cal. F. M. SHAW.

INTELLECTUAL AND MORAL CULTURE.—The supposition is that the educated mind is an earnest in itself for ethical progress; and that vice and ignorance are usually classed in connection, and virtue with intelligence. But this is not altogether so. The mind ought to be scrupulously addressed in education; but moral improvement, aside at times from tuition, can not safely be dispensed with—for it is not the invariable fact. The records of history show us a Robespierre and a Bonaparte—monsters of sanguinary excesses, though on different fields, who were both, with hosts of other wicked characters, educated men! We can not judge exactly aright of mankind, neither devise wise expedients, by classifying people into two grades and condemning one, since honesty, truthfulness, and virtue exist in all conditions. Are the opulent and middle classes the *nonpareil?* Are the poor, often laboring in squalor—the ignorant from necessity, as is generally the case—the reprobate? This way of judging men, and in our republic, as in that of Rome, some way separating the community into "patricians" and "plebeians" is ominous of confusion, and loaded with a heavy weight of danger for the time when population fills the broad regions of the West, and its redundancy of inhabitants throws emigrants back upon the almost fossilized East. The forecast of sagacious statesmanship would consider this question early and provide in schools, academies, and universities for that moral training, with sedulous care, of all boys and girls, which, in its adequacy to any little perfection, would comprise the Golden Rule of Christ, and the righteousness and justice of loving neighbors and even enemies; for upon the principle of that rule hangs the vitality of liberty itself, which any philosopher can discover by ratiocinative analysis.

If we Americans desire liberty and union permanently—wish to avoid future conspiracies and shocks of war and a division of our confederacy into discordant, belligerent States, connected by no tangible link—we can not, timely wise, do better than to institute and introduce a better plan of moral instruction in the schools and by qualified teachers—for safety lies in that moralization of all classes of the people, irrespective of wealth or talent. This arrangement and operation of our schools ought never to be procrastinated. For in the life of nations it sometimes requires that a century *before* some design for future security should have been commenced. Had Las Casas in South America been withheld from suggesting the slave trade, two hundred years agone, the late civil war had not occurred. Had Greece in ancient times been docilely guided by the counsels of Socrates, she had been a model of mental and moral worth, the exemplar of nations, instead of such only in the fine arts and a dubious philosophy. F.

WISDOM.

"Think truly, and thy thought
Shall be a fruitful seed."

THEY are never alone that are accompanied with noble thoughts.—SIR PHILIP SIDNEY.

No man can be provident of his time who is not provident in the choice of his company.

COURAGE, the commonest of the virtues, obtains more applause than discretion, the rarest of them.

CULTIVATE consideration for the feelings of other people, if you would never have your own injured.

IT is a maxim worthy of being written in letters of gold, that there is no method so certain of defeating the plots of wicked men against us as by acting uprightly.

SHE who does not make her family comfortable, will herself never be happy at home; and she who is not happy at home, will never be happy anywhere.—ADDISON.

HE who says education, says government; to teach is to reign; the human brain is a sort of terrible wax that takes the stamp of good or evil according to whether an ideal touches it or a claw seizes it.—VICTOR HUGO.

MAN is his own star, and the soul that can
Render an honest and a perfect man
Commands all light, all influence, all fate!
Nothing to him falls early, or too late.
Our acts our angels are, or good or ill,
Our fatal shadows that walk by us still.

THE older I grow—and I now stand upon the brink of eternity—the more comes back to me the sentence in the Catechism, which I learned when a child, and the fuller and deeper its meaning becomes: "What is the great end of man?" "To glorify God and to enjoy Him forever."—CARLYLE.

MIRTH.

"A little nonsense now and then
Is relished by the wisest men."

How to take life easy—be careless with petroleum.

SIXTY thousand Philadelphia families, it is said, will soon break up housekeeping and return the Centennial visits of their friends.

IT is related of Dr. Garth, in his last illness, when he saw his fellow-doctors consulting together at his bed-side, that he raised his head from his pillow and said, with a smile: "Dear gentlemen, let me die a natural death."

FOUR-YEAR-OLD to his mother holding the baby: "Say, mamma, say! Zat squaling 'ittle baby seems to sink 'ee's the only chile you got! I'd give him back agin!"

It was a New Jersey wife who said: "My dear, if you can't drink bad coffee without abusing me, how is it that you can drink bad whisky without abusing the bar-keeper?"

A stout German in the beer industry to an unprofitable customer: "Here, now, you took dose doors und valk owet mit your ears, eh? (He doesn't). "Heim, you don'd got out? Vell, you waits a minute und I gets a man dot vill!"

A pompous individual walked up to the bar of a sea-s de hotel, and, with considerable flourish, signed the book, and exclaimed: "I am Lieutenant-Governor of ——." "That don't make any difference," says the landlord; "you'll be treated just as well as the others."

A man in Nevada was boasting of the wonderful scent of his mastiff. He concluded his yarn with the triumphant query: "What d'ye think about that?" "Do you want to know what I think about it?" said one of the bystanders; "Well, think you'd better go and take a bath!"

Library.

In this department we give short reviews of such New Books *as publishers see fit to send us. In these reviews we seek to treat author and publisher satisfactorily and justly, and also to furnish our readers with such information as shall enable them to form an opinion of the desirability of any particular volume for personal use. It is our wish to notice the better class of books issuing from the press, and we invite publishers to favor us with their recent publications, especially those related in any way to mental or physiological science.*

Gospel Temperance. By Rev. J. M. Van Buren. 12mo, pp. 114. Price, 60 cents. New York: National Temperance Society and Publication House.

So important a topic should not be treated with an unlearned and careless pen, and we think that Mr. Van Buren has embodied in this compact volume the results of grave and lengthened study. Starting from the true significance of the word *engkrateia*, which is translated temperance, but which means far more, viz., having self-control, or being master of one's self, continent, he reasons toward the conclusion that this "temperance" intimates that degree of restraint which involves "total abstinence in regard to anything wrong in itself, or evil in its tendency." The baleful influence of intoxicating drink upon society furnishes those evidences with which his views are sustained. His logic is good in its conflict with the theological defenders of the practice of wine-drinking, and applies the lash of sarcasm sharply to their pleas, which are in so many cases a mere cloak for self-indulgence. The book is an argument which every "undecided" clergyman who loves the good of his parishioners should read thoughtfully.

The Application of Electricity as a Therapeutic Agent. By J. H. Rae, M.D. 12mo, cloth, pp. 131.

After devoting a few pages to the discussion of the production of electricity by mechanical agencies, and some remarks explanatory of the different forms or qualities of "currents," the author proceeds to formulate the methods in which electrical treatment is administered with the *superinduced* battery. The treatise is intended mainly for the use of physicians using the Homœopathic system, suggestions with reference to medical administration being also given.

In diagnosis the galvanic battery is of high value, readily, in the hands of the skillful operator, indicating the location of a disease, which without it might escape discovery. The author has introduced a new form of battery, which commends itself by the simplicity of its arrangement and by the power which may be developed in its application.

Chedayne of Kotono. A Story of the Early Days of the Republic. By Ausburn Towner. New York: Dodd, Mead & Company. 12mo, pp. 606. Fancy cloth, $1.50.

As might be expected from the title, the story is made up of characters mainly of the homely, frontier pattern, in the treatment of which the author pursues a direct course, the scenes and incidents permitting little room for dark and mysterious plots. In the first two or three chapters we are introduced to the persons whose shares in the narrative are among the largest. Benjamin Libback, a gossipping, good-natured, honest fellow, whose part in the war and affection for the half-wild life of the hunter rendered him more of the vagabond than a steady member of village society; Finis Dare, the daughter of a man who had borne a not inconspicuous part in the Revolutionary struggle, and whose beauty, youth, and intelligence are, of course, the object toward which much of manly consideration is directed; Watt Chedayne, the hero of the tale and the silent lover of Finis.

The plot appears to be the old conflict of power and wealth with poverty and worth. In other words, the rich and influential partners in a company organized for the purpose of settling a rich tract in Pennsylvania, endeavor by falsehood, threats, and persecution, and by suborning the arm of the law to oust their poor associates from participation in what promises to be a very profitable venture. The troublous times are favorable to wickedness of this sort. Many of the incidents are expressive of intense love and hatred, and some of the *denouements*, like that in which Vantwerp shoots "Big Mike," are very astonishing. But out of the troubles, sorrows, and mistakes, happiness at length emerge and the reader is surprised by the one termination that Chedayne loved Mrs. Dare, instead of the daughter Finis.

THE BREWER'S FORTUNE. By Mary Dwinell Chellis, author of "The Temperance Doctor," etc. 16mo, cloth, pp. 428. Price $1.50. New York: National Temperance Society and Publication House.

This author has given volume after volume of temperance stories, until her name, like that of the venerable Arthur, has become identified with the cause of virtue and decency. Mrs. Chellis improves by experience. "The Brewer's Fortune" is in many respects superior to her earlier volumes, and glows with earnest feeling. An old brewer is brought at the last to recognize the moral damage his enterprise has occasioned in society, and ceases to manufacture the degrading beverage. But with the suspension of the work arise social and industrial questions, particularly affecting the old hands of the brewery, and the bulk of the fortune achieved through the malt vats is applied to their employment in honorable callings and toward their redemption from the drinking habits they had formed while in the brewery.

THE COOKING MANUAL of Practical Directions for Economical Every-day Cookery. By Julia Corson, Superintendent of the New York Cooking School. New York: Dodd, Mead & Company.

In about 270 recipes Miss Corson covers the field of the average cuisine, and when her methods are compared with what have been so long fashionable, they certainly possess the merit of economy, and of a superior nutritive value. The suggestions given with regard to the selection of table supplies are brief and to the point; and the phraseology in general of the recipes is clear and intelligible—a fact which can be stated of very few "cookery books." The author has, of course, kept in the view what are regarded by society purveyors the best formulæ for furnishing the tables of the well-to-do, and has aimed to modify their expensiveness, so as to bring them within the reach of the housekeeper whose circumstances are but comfortable. She does not claim to be hygienic, so the items of pepper, mustard, vinegar, lard, garlic, oil, frequently occur. In Chapters X. and XI.—"Cheap Dishes without Meat"—occur a few excellent recipes for preparing cereals; but in XI. most of the dishes are really composed of flesh, from pork to tripe.

THE ANONYMOUS HYPOTHESIS OF CREATION. A Brief Review of the So-called Mosaic Account. By James J. Furniss. New York: Charles P. Somerby.

Within the compass of fifty-five pages the author presents an outline of the method usually pursued by those writers who dispute the divine authority of the Mosaic writings, and interpret in a very literal manner their profound declarations. We think that the writer is quite original in some of his conceptions. For instance, his consideration of verse 4 of Genesis i., which appears to us rather of the captious sort than serious reasoning. So, too, with regard to verses 6, 7, 8, his pleading smacks of the *ex parte* attorney. If what the archæologists teli us of the ancient Egyptians be true, they were no fools in the matter of natural science. And Moses, we are told, "was learned in all the wisdom of the Egyptians." The literalism of Mr. Furniss appears in every page, and we are ready to admit that if King James' very inaccurate rendering is always to be accepted literally, the case presented in the "Anonymous Hypothesis" is a very strong one.

REPORT OF PROGRESS in the Greene and Washington District of the Bituminous Coal-fields of Western Pennsylvania. By J. J. Stevenson. Illustrated with three Sections and two County Maps showing the calculated local depths of the Pittsburg and Waynesburg coal beds beneath the surface.

This bulky volume is an account of explorations and observations with reference to coal deposits, made in the course of the second geological survey of Pennsylvania. Professor Stevenson evinces his customary precision and close adherence to scientific method in detailing the results of the work performed under his own supervision. His analyses of the coal measures of the townships assigned for his investigation are given with particular application to their economic values, and have that unmistakable definiteness which mark the experienced and thorough observer.

PUBLICATIONS RECEIVED.

THE SEMI-TROPICAL. A monthly devoted to the agricultural and other interests of Florida, shows ability, taste, and energy in its management. Mr. Reed is certainly successful in making a very attractive magazine.

RAND'S NEW YORK CITY BUSINESS DIRECTORY for 1877 is a compact and neat 18mo volume, containing about four hundred pages. The publishers claim that no pains have been spared to make the work complete, the success of their experiment in the same line stimulating them to greater diligence to secure accuracy in the different specifications. A very large circulation of the Directory is already insured. Price, in paper, 75 cents; in cloth, $1.

PETTINGILL'S NEWSPAPER DIRECTORY and Advertiser's Hand-book for 1877: comprising a Complete List of the Newspapers and other periodicals published in the United States and British America. A compact and neatly printed octavo of 334 pages, with several fine portraits of leading New York newspaper men.

NEW YORK PROTESTANT EPISCOPAL CITY MISSION SOCIETY. The Growth of Charities in our Metropolitan City is the subject of a graphic sketch.

SCRIBNER'S MONTHLY for June. An admirable number, combining an unusual variety of interesting features.

VICK'S FLORAL GUIDE, No. 2, for 1877. In which some scientific notes are mingled with the horticultural advice.

THE CLOTHIER AND HATTER. A new trade weekly, has the appearance of good editorship and strong backing. May it prosper!

BOOKS AT HALF-PRICE.

OUR CLEARANCE LIST.

There are on the shelves of every publisher, books that are unsalable on account of having been used as samples, becoming shelf-worn, or remnants of Editions. Having some of this stock, we propose to offer it at greatly reduced prices, many books at half-price, including postage, as will be seen from the list. Of some of these we have but a single copy, and they can not be duplicated at reduced prices, it will therefore be better when ordering to make a first and a second choice, that something from the list may be sent.

The Rural Manuals, comprising the house, the farm, the garden, and domestic animals; a very useful and practical book. Published at $2.25, reduced to $1.25.

The Domestic Practice of Hydropathy, with illustrations, by Edward Johnson, M.D. Published price $1.50, reduced to 80 cents.

Man's Origin and Destiny considered from the platform of science. By J. P. Lesley. Published price $4.00, reduced to $2.00.

Gems of Goldsmith, including "The Traveller," "The Deserted Village," and "The Hermit." With notes and illustrations. Extra cloth, full gilt. Published price $1.00, reduced to 50 cents.

The Hydropathic Cook-Book, with receipts for cooking on hygienic principles. By Dr. Trall. Published price $1.25, reduced to 75 cents.

Bacon's Descriptive Hand-book of America. Published price $2.00, reduced to $1.00.

Coughs and Colds; or, the prevention, cause, and cure of the various affections of the throat. By Dr. Hall. Published price $1.50, reduced to 90 cents.

Newman Hall in America. Rev. Dr. Hall's lectures on temperance and missions to the masses. Also, an oration on Christian Liberty. Published price $1, reduced to 50 cents.

Pronouncing Vocabulary of Geographical and Personal Names, embracing all the names worthy of note in the known world, to which is added a complete list of scriptural names. Published price $1.50, reduced to 90 cents.

Derrick and Drill, or an insight into the discovery, development, present conditions, and future prospects of petroleum. Published price $1.50, reduced to 75 cents.

The Skeleton and the Teeth. By Owen. Published price $1.50, reduced to $1.

Life and Public Services of Charles Sumner. By C. Edwards Lester. Published price $3.75, reduced to $2.25.

The Work of God in Great Britain by Messrs. Moody and Sankey, with portraits and biographical sketches. Published price $1.50, reduced to 90 cents.

Homes for All. The gravel wall and octagon mode of building. Published price $1.25, reduced to 75 cents.

The Life, Character, and Work of Rev. THOMAS H. STOCKTON. By Alexander Clark. Flexible cloth. Published at 50 cents, reduced to 25 cents.

The Conversion of St. Paul. By George Jarvis Geer, D.D. Extra cloth, red edges. Published at $1.00, reduced to 50 cents.

The Ryme of the Ancient Mariner. In seven parts. By Samuel T. Coleridge. With new illustrations by Chapman. Extra cloth, full gilt. Published at $1.00, reduced to 50 cents.

Expression, its anatomy and philosophy, by Sir Charles Bell. With the original notes and illustrations designed by the author, and with additional illustrations and notes by the editor of the PHRENOLOGICAL JOURNAL. Published at $1.25, reduced to 75 cents.

The History of the Salem Witchcraft. A review of Charles W. Upham's great work from the *Edinburgh Review*, with notes by the editor of the PHRENOLOGICAL JOURNAL; including, also, the Planchette Mystery; and Spiritualism, by Mrs. Harriet Beecher Stowe. Cloth. Published price $1, reduced to 50 cents.

Thoughts for the Young Men of America, with Thoughts for the Young Women of America. By L. M. Reavis. Published at $1.00, reduced to 50 cts.

The Temperance Reformation. Its history from the organization of the first temperance society to the adoption of the Maine Liquor Law. Published at $1.50, reduced to 75 cents.

The Management of Infancy. Physiological and moral treatment. By Combe. Published at $1.25, reduced to 75 cents.

The Dress and Care of the Feet, showing their naturally perfect shape and construction, their present deformed condition, and how flat feet, distorted toes, and other defects are to be prevented or corrected. With directions for dressing them elegantly, yet comfortably, and hints upon various matters relating to the general subject. Illustrated. Published at $1.25, reduced to 75 cents.

Christian Household. Embracing Christian home, husband, wife, father, mother, child, brother, and sister. Rev. George S. Weaver. Published at $1.00, reduced to 50 cents.

Marvels of Prayer illustrated by the Fulton Street Prayer-meeting, with Leaves from the Tree of Life. By Matthew Hale Smith. Extra cloth. Published at $2.50, reduced to $1.25.

Aims and Aids for Girls and Young Women on the various duties of life. By Rev. G. S. Weaver. Published price $1.25, reduced to 75 cents.

Our Currency; what it is and what it should be. By John G. Drew. Published price 15 cents, reduced to 5 cents.

The Elocutionist's Annual, comprising popular readings, recitations, declamations, dialogues, tableaux, etc. Cloth. Published price 75 cents, reduced to 40 cents.

Oakum Pickings. A collection of stories, sketches, and paragraphs contributed from time to time to the telegraphic and general press. By John Oakum. Published price $1.50, reduced to 75 cents.

Human Longevity; its facts and fictions, including an inquiry into some of the more remarkable instances, and suggestions for testing reputed cases. By William J. Thoms. Published price $3.75, reduced to $2.00.

The Phrenological Journal and **The Science of Health.** Having some odd numbers that can not be used in binding, these will be sent, selected from our stock, at the rate of $1.00 for ten different numbers. Of *The Science of Health*, published before the combination, we will send ten numbers for 50 cents.

Persons desirous of taking advantage of this offer should send at once. Revised lists will be issued from time to time as our stock accumulates. Address all orders to

BOOKS GIVEN AWAY!

We offer one of the following books to all who subscribe, before August 1, 1877, for **The Phrenological Journal and Science of Health** for one year from July, 1877, sending $3, subscription price, and twenty-five cents extra as payment of postage on **The Journal** and **The Premium Book.** Those who have already paid for the balance of this year may have the Premium by subscribing now for 1878. Send amount, $3.25, at once, and state which Book is desired.

Constitution of Man.—Considered in relation to External Objects. By George Combe. Twenty Engravings, and a Portrait of the author. $1.50.

Lectures on Phrenology.—By George Combe. With Notes. $1.50.

Moral Philosophy.—By George Combe. Or, the Duties of Man considered in his Individual, Domestic, and Social Capacities. With the author's latest corrections. $1.50.

Expression, its Anatomy and Philosophy. By Sir Charles Bell, K.H. With numerous Notes, and upward of Seventy Illustrations. $1.25.

How to Read Character.—A New Illustrated Hand-Book of Phrenology and Physiognomy. With 170 Engravings. $1.25.

Marriage.—A Phrenological and Physiological Exposition of the Functions and Qualifications for Happy Marriages. By L. N. Fowler. $1.25.

Phrenology Proved, Illustrated, and Applied. An Analysis of the Primary Mental Powers in their Various Degrees of Development, and location of the Phrenological Organs. $1.50.

Hydropathic Cook-Book.—Containing Recipes for Cooking on Hygienic Principles, the Selection and Preservation of Dietetic Material, etc. By R. T. Trall, M.D. Muslin, $1.25.

Principles of Physiology applied to the Preservation of Health and the Improvement of Physical and Mental Education. Combe. $1.50

Domestic Practice of Hydropathy. By Edward Johnson, M.D. Illustrated. $1.50.

Family Gymnasium.—Improved methods of applying Gymnastic, Calisthenic, Kinesipathic, and Vocal Exercises. By Trall. $1.50.

Food and Diet.—With Observations on the Dietetical Regimen suited for Disordered States of the Digestive Organs. By Pereira. $1.50.

Fruits and Farinacea, the Proper Food of Man. With Notes by Trall. $1.50.

Management of Infancy: Physiological and Moral Treatment. By Combe. $1.25

Wedlock; or, the Right Relations of the Sexes. A Scientific Treatise, disclosing the Laws of Conjugal Selection, showing Who May and Who May Not Marry. With fine Portrait of Author. By Samuel R. Wells. $1.50.

Popular Physiology.—A work for the general reader, and arranged as a text-book for schools, colleges, and families. $1.25.

Memory and Intellectual Improvement, applied in Cultivation of Memory. $1.25

Mental Science, according to the Philosophy of Phrenology. Delivered before the Anthropological Society. By Weaver. $1.25.

Self-Culture and Perfection of Character, with Management of Children. $1.25

Life at Home; or, the Family and its Members. Husbands, Wives, Parents, Children, Brothers, Sisters, Employers and Employed. By Rev. Wm. Aikman, D.D. $1.50.

Education: its Elementary Principles founded on the Nature of Man. By J. G. Spurzheim, M.D. With an Appendix containing the Temperaments, and a brief Analysis of the Faculties. By S. R. Wells. Illustrated. $1.25.

Midwifery and the Diseases of Women. With General Management of Childbirth, the Nursery, etc. For Wives and Mothers. $1.50

Hopes and Helps for the Young of both Sexes. Character, Choice of Avocation, Health, Amusement, Courtship, and Marriage. $1.25.

Aims and Aids for Girls and Young Women on the Duties of Life. Physical, Intellectual, and Moral Development, Education, Duties to Young Men, Marriage, and Happiness. $1.25.

The Parents' Guide; or, Human Development through Inherited Tendencies. $1.25.

The Hygienic Hand-Book.—A Guide for the Sick-Room, with Appendix. $1.50.

Water-Cure in Chronic Diseases,—Causes, Progress, and Termination of the Diseases of the Digestive Organs, Lungs, Nerves, and Skin, and their Treatment. By Gully. $1.50.

How to Teach according to Temperament and Mental Development; or, Phrenology in the School-room and the Family. By Nelson Sizer. A book for Parents and Teachers. $1.50.

To be entitled to the above Premiums, subscriptions must be received before August 1st, 1877, for one year from July, 1877, or, in case present subscription has not yet expired, for 1878, and include twenty-five cents extra as postage. THE PHRENOLOGICAL JOURNAL AND LIFE ILLUSTRATED.

VOL. 65. 1877.

NUMBER 2.] *August, 1877.* [WHOLE NO. 464.

HENRY CLAY.

LEAVES FROM AMERICAN HISTORY.

"I WOULD rather be right than be President." This was the reply of Henry Clay to a committee of his political friends, who said to him: "Mr. Clay, you *must* modify your views of certain questions of national policy, or you can not be nominated for the Presidency." It was a noble reply, and it will live to honor its author long after the words and acts of his successful rival have been forgotten. It has the ring of the pure gold, and deserves to rank with those maxims and sayings of classic literature and history that have served to crown with immortal fame the sages and patriots of Greece and Rome.

Henry Clay was a representative Ameri-

can, as a politician, a statesman, a patriot, a gentleman, an orator, a representative of whom his fellow-countrymen may well be proud. Born in 1777, the child of poverty and heir of privations, he proved the nobility of his blood by achieving a destiny of which the kingliest man might be proud. He was not a man of transcendent talent or marvelous genius. His gift of oratory was of a high order. He was the American Demosthenes, and his mind was eminently adapted to the comprehension of legal abstractions, and to the science of diplomacy; and in these, combined with his integrity of character and pleasing address, lay his power. And he was a power. From the day he entered the Senate of the nation, in 1806, to the day of his death, in 1852, he exerted an influence over the political destiny of this country, of which no other man of his time could boast. It was a peculiar influence, a pacific influence. In his public career he was peace-maker, a compromise man, delighting not in violence and strife, and deprecating war as the greatest of evils. His mission was to pour oil on the troubled waters. He was kindly-hearted as a general rule, and generous to a fault. Men of positive minds, such, for example, as Randolph and Calhoun, of the South, and Giddings and Garrison, of the North, could not understand or appreciate Henry Clay; hence both distrusted and despised his efforts to reconcile the irreconcilable. He was anti-slavery in sentiment, and a slaveholder in practice. Yet he was not inconsistent, save from their standpoint. He recognized slavery as an existent institution, protected by the articles of confederation and recognized by the Constitution of the United States. An institution which could not be abolished legally and arbitrarily without the consent of the parties most interested—the slaveholders—yet he recognized it as a political, social, and moral evil, which ought to be abolished, and which he believed would be at no distant day.

Henry Clay was the son of the Rev. John Clay, of Virginia, a Baptist clergyman. He was born on the 12th of April, 1777, on a farm, in a section of Hanover County, called the Slashes, and received the rudiments of a very common school education, in a country school kept by an old-fashioned Virginia schoolmaster, whose scholastic acquirements were bounded by reading, writing, and the simple rules of arithmetic. The father died when Henry was five years of age, leaving his family without property, save a few household effects. Young Clay improved what opportunities he had for education, and at the age of fifteen had the good fortune to secure a situation as copying clerk in the Court of Chancery at Richmond. While filling this position, he won the friendship of Judge Wythe, a distinguished lawyer, who had known and respected the young clerk's father. The patronage of this gentleman was of great service to Henry. Through it he was enabled to study law under the most favorable circumstances. He was admitted to the bar at the early age of twenty. He at once removed to Lexington, Kentucky, where he opened an office and entered upon a most successful career.

He was poor, and his education was by no means classical, nor was he a Chesterfield in social culture, but he was talented, handsome, genial, and dignified, and there was a natural grace of bearing that helped greatly to win respect and render him popular. He was admitted to the best society the village afforded—and Lexington, even at that early period, was not without her aristocracy, composed of some of the best families of Virginia and other Southern States.

Whatever may be said against the Kentucky aristocracy, there is this I wish to record in their favor: that, as a general rule, talent, honor, and integrity were respected by them, though joined with poverty. The fact that young Clay was poor—a fact which he made no effort to conceal—was no bar to his social recognition or advancement, and within two years after his advent in the incipient city, he married the reigning belle of the place, a daughter of Colonel Thomas Hart.

This event occurred in 1799, the year in which Kentucky adopted a State Constitution. Mr. Clay had distinguished himself in his own county by his Fourth of July

orations and his speeches in court. He now achieved a State fame by a series of well-written papers, and a number of able speeches in favor of the gradual emancipation of slavery. His plan was to make provision in the Constitution for the extinction of the institution by a system of graded emancipation. Thus early did he put himself on the record as an active anti-slavery man, and he never changed his views on that subject. He allied himself to the Republican party, of which Thomas Jefferson was the leader, and in 1804 he was elected to a seat in the State Legislature. Two years later he was chosen by that body to represent the State in the United States Senate. It was subsequently charged, by his political foes, that he lacked a few months of the constitutional age—thirty years—when he entered the Senate, and therefore he perjured himself to secure his seat. He served five years in the Senate, and in 1811 he was elected to a seat in the House, and was at once chosen Speaker of that body.

Mr. Clay actively supported the administration of James Madison, and advocated the justice and expediency of the war with Great Britain. He was in sympathy with the anti-bank policy of the Republican party, but he favored protection to American manufacturers from the start, and consistently through his whole public career. He was re-elected to Congress in 1813, and again chosen Speaker of the House, which position he resigned in January, 1814, to accept the appointment of Commissioner-Extraordinary to the Council of Ghent, where he had the honor of signing the Treaty of Peace between this country and England. On his return from Europe, in September, 1815, he was again elected to represent his district in Congress, and on taking his seat he was again chosen Speaker of the House. He was returned by his constituents in 1817, 1819, and 1821, and each time chosen as presiding officer, a very high recognition of his ability and integrity.

Mr. Clay's views underwent a change on the question of the United States Bank in 1816. He publicly announced this change, giving his reasons for it, and from this date, as long as this was a party question, he was in favor of a National Bank. He was now practically a Federalist, being in favor of a protective tariff and a national bank, the two principal things that the Democratic party was organized to oppose. Party lines were hardly so well defined then as subsequently, but Mr. Clay was understood to be a Federalist from this time, hence he could not be justly accused of bad faith in preferring Adams to Jackson for President, in 1824, a charge which was kept alive to his prejudice during his whole subsequent life.

The Missouri question, which had been giving all parties a great deal of premonitory trouble, culminated in 1821, on the occasion of that incipient State asking admission into the Union with a Constitution recognizing slavery. The advocates of slavery had felt confident of their power from the time of the purchase of Louisiana, in 1803, and they resolved to contest for recognition of their favorite institution in every State that should be organized within the boundaries of the Louisiana territory. The effect of this was to create a strong sentiment in the North in favor of limiting the encroachments of the slave power. Excitement ran high, and a dissolution of the Union was apparently imminent. Missouri was a portion of Louisiana, but she lay so far north that a large portion of the State was north of Kentucky, the most northern of all the Southern, or slave States, and was claimed with some show of reason and fairness by the friends of free soil The slave party held an advantage in the fact that the citizens of Missouri had adopted a slave Constitution, thus showing themselves in favor of the institution. And this Constitution they had adopted with the understanding that they were free to regulate their domestic matters in their own way, as the legal restrictions imposed upon the North-west territory by the ordinance of 1787 did not affect the territory comprised in the Louisiana purchase.

Mr. Clay prepared a bill providing for the admission of Missouri as a slave State, and restricting slavery thereafter to such territory as lay south of the parallel of thirty-six degrees and thirty minutes north lati-

tude. This bill expressly stated that north of said parallel slavery should never be allowed to go, but that in all territory then belonging to the United States, or which might thereafter be acquired south of said line, the people should be allowed to organize State constitutions and be admitted with or without slavery as they should choose. This bill met with favor from the moderate men of both sections, and was adopted; but it met with disfavor from the extremists of both. It passed into history under the title of the Missouri Compromise Bill. When we remember the status of public opinion on the slavery question at that period, we can but do Mr. Clay the justice to conclude that he regarded it in the light of a triumph for Freedom as well as for Union. This opinion is confirmed and justified by his opposition to the Annexation of Texas at a subsequent period, which opposition was based solely on the ground that it would increase the area of slave territory. He declared in 1844, when a candidate for President, that no earthly power should ever induce him to consent to the addition of one acre of slave territory to the United States. His defeat by Mr. Polk was due in large measure to that declaration—not because the people were in favor of slavery *per se*, but they were through national pride in favor of Annexation.

Mr. Clay was a candidate for President against Andrew Jackson, John Quincy Adams, and William H. Crawford, in 1824, receiving thirty-seven electoral votes. Jackson had a plurality, but not a majority of the votes, hence the choice of a President devolved upon the national House of Representatives. Adams was next to Jackson, and Crawford third in the contest before the people, but when it came to the House, Clay was found to hold the balance of power, and he gave his influence to Adams, who was elected. The partisan foes of Clay accused him of corruption in connection with this matter, but without sufficient ground, I think. There were really no political parties in this country at that time, the Federal party having given up the ghost some years before, and the Whig party not having been born, the Republicans had no opposition and could not therefore make a fight. With the people it was a question of men, with politicians a question of office, and with statesmen a question of measures. Mr. Clay and Mr. Adams were in agreement upon the chief measures of public policy, while Mr. Clay and General Jackson differed radically on several important points, notably the questions of a National Bank and a Protective Tariff. There was, I think, sufficient ground in this for Mr. Clay's action in the matter, and I am disposed to believe that he acted conscientiously in preferring Adams to Jackson.

It was unfortunate for his reputation that Mr. Adams should have made him Secretary of State, although a better selection could not have been made. The charge of having sold out to Adams for an office was made by John Randolph, in language characteristic of that eminent cynic, and Mr. Clay challenged him therefore to mortal combat. The meeting came off in April, 1826, when after exchanging pistol shots, a reconciliation was effected, by mutual friends. In the light of present civilization duelling is regarded as barbarous, but at that time it was regarded as the only honorable way to settle quarrels between gentlemen, and Mr. Clay could not pass this insult by, as one would now, without serious consequences to his reputation.

Mr. Clay was elected to the United States Senate in 1831, and was a candidate for the Presidency against Andrew Jackson in 1832, receiving the support of Massachusetts, Rhode Island, Connecticut, Delaware, Maryland, and Kentucky.

In the winter of 1832 and '33 the Congress of the United States, and indeed the whole country, were greatly agitated by the question of nullification. The tariff was the subject of quarrel between the two sections, North and South, at this time, the South wanting free trade, and the North, a protection-tariff. John C. Calhoun was the author of the doctrine that a State had a right to nullify any act of Congress that its people regarded as inimical to their interests. The contest of words ran high, and sectional war seemed imminent. That it did not come was due to two facts—the decisive policy

of Andrew Jackson, and the compromise tariff bill of Henry Clay.

The Whig party was organized in 1834, but it had not got strong enough in 1836 to elect a President. Mr. Clay declined the nomination, in favor of General Harrison, who was defeated by Martin Van Buren. In 1840, he desired the leadership of the party in the Presidential contest, but the friends of Harrison urged his claims on the grounds of his having borne the banner of the party when it was weak, and because of his military fame, which they claimed would add greatly to his popularity among the masses of the people. They might have added, and probably did, his want of a political record, as an argument in favor of his availability. This was the only time in the life of Clay when he could have been elected to the Presidency, and both he and his admirers were greatly disappointed at his failure to receive the nomination. In 1844, the young party went into the contest at a disadvantage, owing to the demoralization resulting from the death of Harrison, and the political treachery of his successor, "John Tyler," as well as from the unpopularity of Mr. Clay's views on the subject of the annexation of Texas. The result was, he was defeated by James K. Polk.

He had retired to his home at Ashland, in 1842, with the purpose of never again entering Congress, but in 1848 his people urged him so strongly to return to the Senate of the United States, and use his great talents and influence in favor of peace between the two sections of the country, that he reluctantly consented. He was now in his seventy-first year, and his hair was white as silver, but his form was unbent, and the native dignity of his presence and bearing had increased by age. He was the grandest-looking man that ever crossed the threshold of the Senate chamber. When he addressed the Senate, all eyes were turned toward him, and profound silence reigned, save as it was broken by his still musical voice or by the subdued applause that at times greeted the utterance of some grand sentence of patriotic sentiment.

The war with Mexico had not only settled the quarrel about the annexation of Texas, but it had resulted in the United States coming into possession of California and New Mexico, which were to be organized into States and admitted into the Union. This reopened the slavery question, and the excitement became so great as to seriously threaten the perpetuity of the Union.

The sage of Ashland was looked to by all who wished for peace, to furnish a plan of compromise that should again save the country.

He had been the great compromise peacemaker during the stormy periods of the past, and he was equal to the task now. But on taking the bearings of the situation, he saw that the South would not be content with any settlement that did not include the right and power to reclaim fugitive slaves escaping to the North. He therefore prepared a compound bill known as the "Omnibus bill," the provisions of which included no interference by Congress with the slavery question, in the States to be erected out of the newly-acquired territory, and a stringent fugitive slave law. This bill was supported by Daniel Webster, and other prominent, but mild anti-slavery men, and after a stormy debate it passed both houses of Congress, and receiving the signature of President Fillmore it became a law. This measure gave great offense to the more radical anti-slavery men, but that it postponed the American civil war ten years, there is no room for argument. Mr. Clay said in his speech in favor of this measure: "I owe a paramount allegiance to the whole country, a subordinate one to my own State. I can not afford to be sectional in my views, or allow my personal prejudices to sway my action as a Senator of this great republic." He was without doubt sacrificing his personal sympathies to his love for peace and continued union.

Henry Clay died in the city of Washington, on the 29th of June, 1852, at the advanced age of 73, and was buried at Ashland. His public career covered a period of forty-six years, and was crowned with the most brilliant success throughout. To have been elected President would not have added one iota to his fame, or increased the respect and reverence which the people of America and the world entertain for his name.

T. A. BLAND, M.D.

THE PLACE OF THE MORAL AND RELIGIOUS FACULTIES.

IT has been aptly styled the chief glory of Phrenology to have confirmed the Scriptural doctrine that the religious sentiments are the superior part of man's constitution. Many eminent theologians and moralists have preached and written eloquent discourses developing this principle in a conclusive way, drawing their reasoning from the declarations of Scripture. But it has been reserved for the science of Phrenology to expound and demonstrate this position, and to prove that the dictates of the religious emotions, enlightened by the intellect, are in beautiful harmony with the precepts of Revelation. The following observations constitute a further attempt to corroborate this profound principle, and to fortify it by the aid which historical evidence affords.

In recently studying the subject of Genius, it occurred to the writer that in all the departments of the arts, of painting, poetry, music, and oratory, the masterpieces of composition partake of the religious character. In other words, that the intellectual faculties have acted under the inspiration of the religious sentiments, receiving their stimulus and direction, so much so that the supremest efforts of the mind are pervaded by the spirit and influence of faith and adoration. This remarkable fact is not to be wondered at, if the text of this essay contains a principle of truth, which is the object of these observations to assert and establish.

Directing our attention first to painting, we discover that Michael Angelo, Leonardo Da Vinci, and Raphael are the greatest painters with which history acquaints us, and a glance at their works is ample to sustain the proposition announced. Some of the works executed by Michael Angelo are the "Last Judgment," the "Martyrdom of St. Peter," and the "Conversion of Paul." His celebrated frescoes on the ceiling of the Sistine chapel represent the creation of the world and of man; of the fall and of man's final redemption and salvation.

Da Vinci's celebrated painting of the "Last Supper" is another representation of a religious scene. The works of Raphael, who has been called the prince of painters, portray the "Coronation of the Virgin," the "Entombment," the "Dispute on the Sacrament," "St. Peter delivered from Prison," and the "Transfiguration." These are among the greatest works of art extant, and the reader will observe in their titles the religious characteristic ascribed to them.

If we now consider the subject of poetry, the result is equally striking and convincing. Without traversing religious poetry generally, let the mind confine itself to Milton's great epic, which many eminent critics affirm surpasses every other poem in the world, and every reader cognizant with the scope of "Paradise Lost" will recognize its confirmation of the argument advanced here. The whole of that sublime poem is invested with the truths of religion, and many of its most graphic scenes are drawn from the sacred narrative

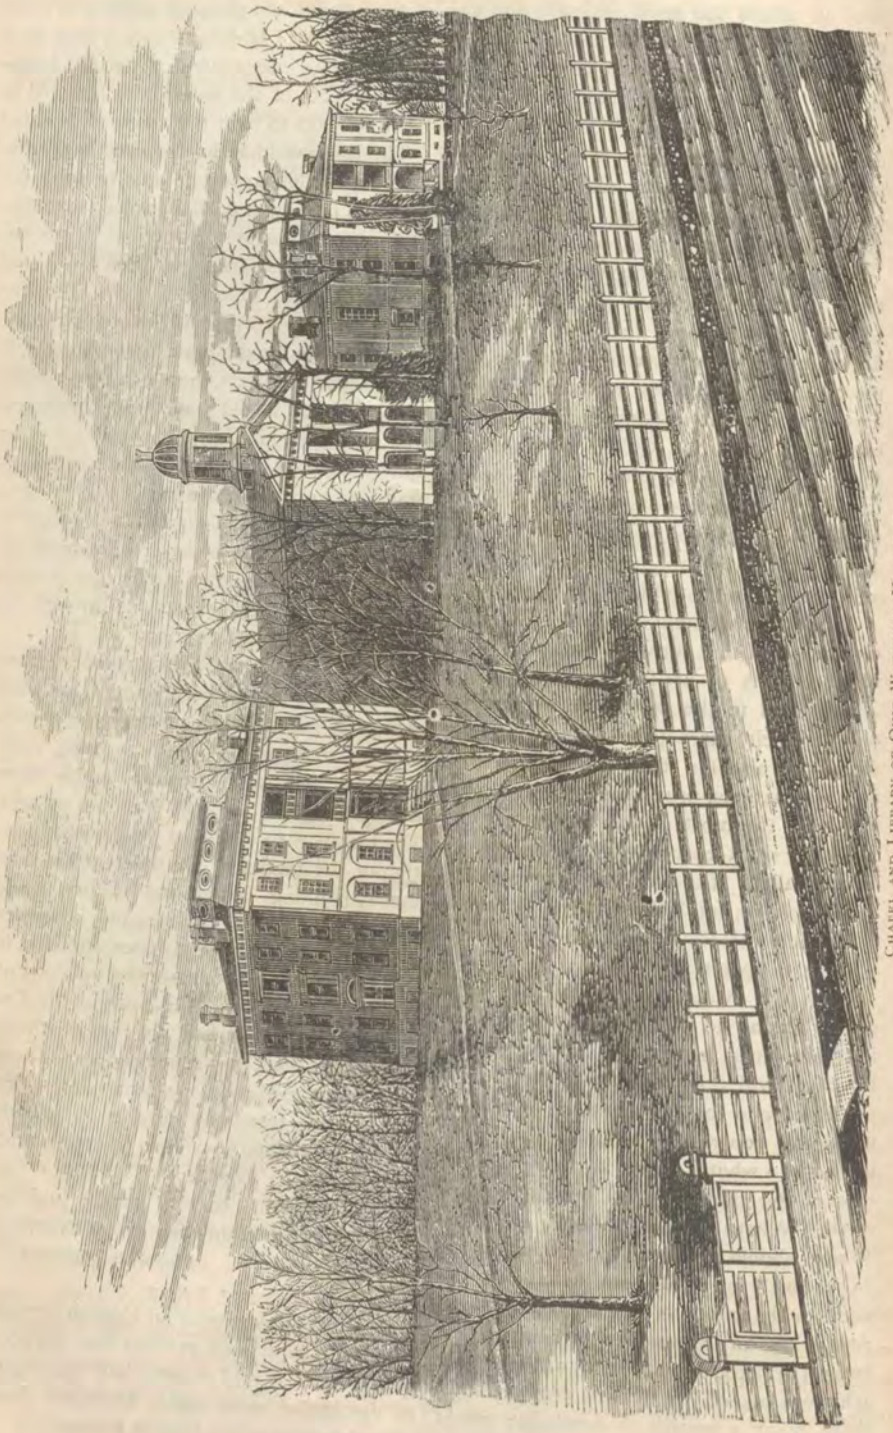
Now let the subject of music be contemplated, and its testimony is equally effective, for is it not a notable fact that the highest kind of music is of a sacred or devotional character? Handel, who is considered by some the grandest of all musical composers, devoted himself in the later period of his life entirely to religious music, and his works are further evidence that the religious faculties, acting in concert with an enlightened mind, are the noblest of our powers. The oratorio of "Joshua," of "Israel in Egypt," of "Jephtha," and the sublime "Messiah" are splendid testimonials to the truth of the preceding remark. And besides, we have Mendelssohn's "Elijah," and "St. Paul," and Haydn's "Creation," with others of immortal memory. All these works are not only religious in their spirit and design, but the language of them, in some instances, is transferred unaltered from the Scriptures, and incorporated with the composer's music, forming its text.

Sacred oratory and architecture supply additional proofs. Although there have been exalted examples of eloquence in the various learned professions, the pulpit has furnished some of the most illustrious, espe-

cially of modern times, and sacred oratory is of all others the most majestic and imposing. The Scriptures themselves may be referred to as a forcible commentary on this opinion. In the writer's humble judgment the sermons of Robert Hall contain the most exquisite specimens of eloquence to be found in our language, and he is happy to find himself supported by Macaulay, William Pitt, Lord Lytton, and others.

In architecture—another branch of art—the greatest monuments of antiquity in heathen nations, and during all ages in Christian countries, have been temples, cathedrals, and structures where individuals have resorted to worship. The colossal temples of India and China, and those of Egypt, Greece, and modern Europe of today, are conspicuous objects among an innumerable multitude which evince the sovereignty of the moral and religious faculties, allied with a cultivated intellect.

Another remarkable fact under Christian civilization is, that most of the great original specimens of art in music and poetry are indebted to the sacred Revelation, not only for their character in a very intimate sense, but also for their incidents, scenes, and associations, producing the conviction that even the most conspicuous minds can make but short excursions into the regions of originality. If the reader hesitates before this assertion, let him examine "Paradise Lost," the "Messiah," and the productions of the great painters.



If all the evidence enumerated is sufficiently strong to justify the premises, the inference must be highly significant, and the effect will certainly not be to diminish our reverence for the Bible. For what a wonderful contrast the world of art now presents to what it would be if the disclosures of the Bible had not been communicated. Where would Milton's epic be? Where should we hear the strains of the "Creation" or "Messiah" that fill the mind with emotions beyond expression? And what an irrevocable loss would the lover of art experience if bereft of the mighty achievements of the Italian painters? In short, what a species of desolation would the civilized world suffer if the fine arts had not been inflamed by that Revelation which is the wonder and glory of millions of intelligent beings? How can such a book be a mere human composition, when the imperial intellects of the world have resorted to it for subjects to light the spark of genius?

The last consideration involved in the discussion, in this aspect of it, is to solve the question (although partially solved already), Why the most noble productions of the human mind in the arts have been suggested by and selected from the records of sacred history? The reply is: If the creative powers of genius could have been directed to more suitable objects, there can be no doubt those objects would have been preferred. We may therefore justly suppose no other sphere for their exercise offered greater attractions, and it appears sound reasoning to repeat the text, that the moral and religious faculties, being the highest endowment of the mind, impelled the intellectual powers to accomplish their conceptions through the medium of religious emotion.

There are many incidental considerations that arise out of this question as it has been regarded, but it would protract the discussion to too great a length to bring them forward, and would require much more ability for their solution than we possess. For instance, to advert to the general question of the merits of the different kinds of music, painting, poetry, and oratory, would exhaust a treatise and demand extensive attainments. All that has been aimed at in this brief review, is to state the opinions of the most competent critics, such as the Encyclopedias furnish, and to embody them. The impressions they convey appear to sustain the conclusions we arrive at. But whether the testimony cited is sufficiently cogent to produce conviction in every mind, is hardly to be expected. The path of inquiry, however, is easy to pursue, and inviting, although embracing a vast extent of research.

THOMAS TURNER.

IN a recent number of an English literary paper it is mentioned as a fact that the poet Wordsworth is said to have had the organ of Veneration more highly developed than any other man of his time in Europe.

CHAPEL AND LIBRARY OF OHIO WESLEYAN UNIVERSITY.

CHARLES H. PAYNE, D.D., LL.D.,

PRESIDENT OF OHIO WESLEYAN UNIVERSITY.

THE original of this portrait has a very active temperament, combining zeal—both mental and physical—with a certain toughness and elasticity which enable him to work easily and abundantly. The brain is large for the size of the body, and tends to exhaust his vitality pretty rapidly; but he, fortunately, is able to replenish his exhausted energies. His motions are quick and spirited; his word, his act, his step, are all emphatic. He moves as if he were in a hurry, but always as if he knew exactly what he wanted to do and was determined to do it promptly, effectively, and successfully. He combines in himself the traits and qualities of both parents, but rather more of the mother than of the father. He appreciates the situation and generally has a plan formed for procedure quicker than most men, and though he does not always stop to reason out a proposed course of action, he is able to give a reason and make it as plain as demonstration. In matters pertaining to the every-day current of life his intuitions lead and guide him; when an abstract question is presented he is able to analyze and reason it out on a logical basis. His method of reasoning—of argument, is generally first by analysis, then by analogy, and lastly he brings in the logical and synthetical phases of the subject; but most people will be able to make their own synthesis by the time he has furnished them the analysis; and as a writer or speaker it is both his pleasure and his pride to make a subject so plain that common people can never mistake or forget it. Hence he has the special qualities requisite for the teacher.

He knows how to bring hard, knotty, and ponderous subjects to the comprehension of the simple and the uninformed. He knows when he gets back to bed-rock—to the first principles, and how to explain beginnings of subjects, and trace them step by step to their ultimate. He may not have an excess of patience with dull, stupid students; but if persons have fair common-sense, he will find out how much there is of it and how to call it into use. Thus he is adapted to explain and make matters clear to those who might not be able to see their way under ordinary instruction.

He has another trait which makes him acceptable to the ignorant, to the dull, and to the weak; and this is an unostentatious kindliness. People who have the least of culture and confidence will come to him because they find in him a brotherly brooding of spirit—the power to bend himself to the wants of the needy. He is generous to a fault. Observe what height there is to the front part of the top-head. Benevolence and Veneration are located in that region. Benevolence renders him generous, mellow, placable, genial, burden-bearing, and sympathizing; and his large Veneration, with moderate Self-esteem, gives him humility, which is the opposite of arrogant domination. Among strangers he does not put on airs or carry himself as if he were "the Czar of all the Russias." His walk and appearance do not impress strangers with the idea that "I am a great man; distinguished, learned, influential, and consequential; therefore I expect respect and deference from everybody." The anterior portion of his head, drawing a line from the opening of the ear to the top-head, is much larger than the back-head; consequently intellect, and talent taken as a whole, with strong religious feeling, predominates in him. If his head were exalted upward and backward of the opening of the ear, in the region of the crown, he would incline to look down upon people—to strive for the highest seat in the synagogue, and to impress everybody with the idea of his greatness. But now he moves among men gently, but actively, never arrogates to himself greatness or power; and his ability to govern those who are rightfully under his authority is more a tendency to lead than to drive—to make people wise enough to do right, or ashamed of themselves if they do wrong, than to be domineering. He does not inspire people with fear of himself, but rather with a disrelish to do wrong, or to do that which is unmanly, unkindly, or mean.

He has wonderful power to read strangers. He would look into the face of a class or of a congregation, and feel that he knew every one of them, and how to express himself to each, how to carry himself so as best to impress, guide, and instruct each one. He is not inclined, therefore, to dogmatize; and sometimes he seems to take more pains to prove things than is necessary to those whose duty it is to accept his *dictum* without question. Explanations are to him very easy. His language is ample. He can wind his words around his thoughts in such a way as to clothe the dryest subjects with garlands. He can build the hard, dry trellis of logic, but he inclines to overspread it with a luxuriance of illustration, so that his subject shall seem to be a living reality rather than a structure of mere strength; more like the vine-clad and fruit-bearing arbor of Autumn than like the dry frame-work of the trellis and the pruned vine in March.

He is orderly and systematical in his thoughts; has a good memory of facts and faces, and places and words. He is ingenious, has a keen sense of combination,

whether it relate to facts and ideas, with the frame-work of argument, or with the structure of machinery, or with moral and social influences. He has the power to coördinate people in such a way that they will work in harmony with each other; and this requires both Ideality and Constructiveness, as well as Benevolence, to melt and mold people so that they will assimilate and coöperate. He is good company for young people, and when he goes among the groups of young people, they all give attention and smile, expecting some pleasant word, some joy-bearing statement that will instruct the intellect, guide the understanding, and pleasantly excite the social and moral feelings. Besides, he is remarkable for his wit. He sees the droll and eccentric, the absurd and the ridiculous, and appreciates everything that is funny; and he does not leave this faculty out in any of the graver forms of effort in which he may be engaged. If he were preaching on "the exceeding sinfulness of sin," he would show that it was ridiculous, and absurd, and unmanly, and unmannerly to be wicked; and would use sarcasm wisely to make vice appear to be odious, and virtue regnant and glorious.

He is fond of children, and especially of young people; is naturally gallant, tender, and gentle to woman; has hardly enough dignity; the crown of the head should be higher. His faith lifts the curtain of future mystery, and gives him to see more clearly than most persons that which lies beyond the lines of logic and the realm of reason; and though he can reason soundly, he is largely influenced by his spiritual and moral sympathies, and accepts as truth much that logic can not reveal, though it may sanction. A mother's love can be felt without corresponding philosophy to explain it. Woman loves first, and reasons about it and sees the propriety of it afterward, but is not, necessarily, moved in her affections by a rational sense of the needs of the one who receives her affection. So this gentleman's spiritual, religious, and fraternal sympathies open to him a world of truth which the reason waits to indorse or fails to comprehend. In common phraseology, the heart leads and the reason follows, in that field.

He ought to be excellent in literature and sound in science. If we could give him more love of gain, more policy, a little more severity, and a good deal more pride and sternness and steadfastness of character, it would aid in setting off to better advantage his intellectual, moral, and religious qualities. He will, doubtless, do more work in a year than almost any man within the wide range of his acquaintance; partly because he works easily, and partly because his intuitions and judgment combine to make his pathway clear and his course decisive. In other words, he does not have to try experiments and retreat. What he begins he carries through; as the slate quarryman knows how to strike a block of stone so as to hit the line of cleavage, and therefore neither spoils material nor wastes time, so our subject, in his dealings with men, in his teachings and arguments, hits the point of the subject the first time, and deals with all sorts of men in as many different ways as there are variations of character, alternating "from grave to gay, from lively to severe." He expresses himself in such a direct manner, though in such varied form, to different persons, that each one feels himself specifically addressed, and wonders how the speaker happened to know all about him, and what he liked best.

He possesses many of the elements of the highest order of popularity. We regret that he has not more crown of head to give him that stern dignity and that exalted ambition

which would enable him to bear aloft his intellectual and moral powers in a manner more mandatory or commanding. There are but few people in any community who thoroughly appreciate him; but when he is gone, and others try to fill his place, they will then see the difference between him and them, and wonder why they did not appreciate him more while he was with them. He is somewhat eccentric, and even boyish, because he lacks dignity; therefore we wish that he had a little more of those stern and dignified elements which always tend to keep a man up to his par value in his own estimation.

Charles H. Payne was born at Taunton, Mass., October 24, 1830, of Scotch-English parents, who came to the United States with the Pilgrims in the *Mayflower*.

The family is long-lived, his mother now being in her eightieth year, while his grandparents lived to be over eighty, and two of his paternal uncles died at a still greater age. His father was drowned while the subject of this sketch was an infant, leaving his education and training to his mother. Mrs. Payne was the daughter of a farmer; she had rare natural abilities, but unfortunately few opportunities for culture, in her youth, were afforded, as compared with the present time.

At an early age Charles was compelled to rely upon his own efforts for a livelihood. From eight to fifteen he labored, sometimes upon the farm, sometimes in the factory, and sometimes upon the shoemaker's bench, attending the public school during the winter. At fifteen he entered a store, where he remained three years, spending much of his spare time over such books as he could procure with his limited means. About this time he became the subject of a decided religious experience, and immediately joined the Methodist Episcopal Church. He made the Bible the subject of close study, and gave much of his time to religious work. At length, leaving his clerkship, he began a course of preparation for the ministry at a select school at Taunton, and in the Providence Conference Seminary at East Greenwich, R. I., from which he entered the Wesleyan University at Middletown, Ct., graduating in 1854. He then attended the Biblical Institute at Concord, N. H. (now Boston School of Theology), and from there entered the ministry. During his course at college he met his entire expenses by teaching, sometimes as a private tutor, and sometimes in the public schools, but always keeping up his studies while absent from the University.

In 1857 he was married to Miss Mary Eleanor Gardiner, and soon after joined the Providence Conference, remaining in it eight years. In the year 1865 he was transferred to the N. Y. East Conference, and stationed at St. John's, Brooklyn, where he induced his people to build a new church edifice, which is one of the finest of the denomination in the country.

At the close of this pastorate he was transferred to Philadelphia, where he took charge of the Arch Street church, whose new and costly marble building was completed during his pastorate. He was afterward stationed at Spring Garden Street church, and from there removed to Cincinnati, O., where he occupied the pulpit of St. Paul's.

In the summer of 1875 he was elected to the Presidency of the Ohio Wesleyan University at Delaware, O., succeeding Dr. Merrick. The degree of D.D. was conferred upon him by Dickinson College, Carlisle, Pa., in 1870, and that of LL.D. by the Ohio University, Athens, Ohio, in 1876.

One who has observed his course previous to and after his assumption of his present duties, writes:

"The past vigorous growth of this institution, its central position in the great State of Ohio, its abundant service to, and widely increasing influence in, the denomination to which it belongs, the rapidly-increasing demands of the Church and country upon it, and the eminent success of preceding administrations, required in the incoming president abilities of no ordinary cast.

"It is probable that no position to which a man is called demands greater or more

varied and flexible talent than that of a president of a literary institution. He is expected to be a man of ripe scholarship, of broad learning, a successful organizer and financier, of profound sympathy with youth, of popular pulpit and platform powers, and of so symmetrical and transparent a character that it shall prove a rich legacy to all his students.

"Dr. Payne's recognized ability as an instructor, pastor, and administrator naturally suggested him for the high office to which he has been called, and gave rise to large expectations which the initial year of his administration proves were well authorized.

"His ready adaptation to his varied duties, his quick comprehension of both underlying principles and minute details, his attractive oratory, his sound judgment, his wise counsels, his firm but kind discipline, his untiring activity, and his undivided attention to the great interests over which he presides, promise an educational career of commanding usefulness."

Dr. Payne recently published a sermon on "Our Nation's True Policy in respect to Christianity and the Bible," which has attracted much attention. A pamphlet of his, entitled "The Social Glass and Christian Obligation," is one of the strongest appeals that have ever been written for total abstinence on the part of Christians from any use or sanction of alcoholic drinks. His sermons on "Daniel, the Uncompromising Young Man;" "Solomon, the Brilliant Failure;" "John, the Rebuker of Herod, the Freelover," with others which have been published, are models of earnest and living pulpit eloquence.

MERRICK HALL.

THE OHIO WESLEYAN UNIVERSITY,

which to-day occupies a high position among the colleges of the West, was founded about thirty-five years ago, under circumstances which gave little promise of its after extension and importance. Edward Thomson, subsequently Bishop in the Methodist Episcopal Church, was made first President of the Faculty, with a salary of only $800.

As the institution opened with but twenty-nine enrolled students, with no endowments to support a faculty, no library or apparatus for illustration, the small compensation accorded the President and the professors can not be a matter of surprise. After three or four years, however, the increase in the number of students rendered it necessary to enlarge the building, or add an extra structure. Morris Hall was erected on the College grounds for the use of students as a boarding-place, but the wisdom of the management has inclined to discountenance the grouping of students by themselves, preferring that they be placed in families in the immediate vicinity of the College, so that they shall have some of the associations of home, and intercourse with older persons. In 1851 Thomson Chapel was built at a cost of $22,000, and is a handsome structure of brick, three stories in height. It is the central one of the three buildings shown in our first engraving. In 1866 the funds were contributed for the erection of a building for the purposes of a library, and President Thomson visited England and France to select books for it, and many additions were made to the shelves by gentlemen interested in the prosperity of the institution, so that now it contains nearly ten thousand volumes.

Professor Frederick Merrick succeeded Dr. Thomson in the Presidency. Dr. Merrick had been a professor in the institution from 1845 until 1860, when Dr. Thomson resigned to take the editorship of the *Christian Advocate and Journal*. After thirteen years of service in this important relation, Dr. Merrick resigned on account of ill-health, and Dr. Payne, as we have already noted, was elected by the trustees to the Presidency. In 1874 a new building was erected for the purpose of providing accommodation for the cabinet and museum of natural history, and lecture-rooms for the scientific departments associated with the museum. It was named "Merrick Hall," in honor of the late President.

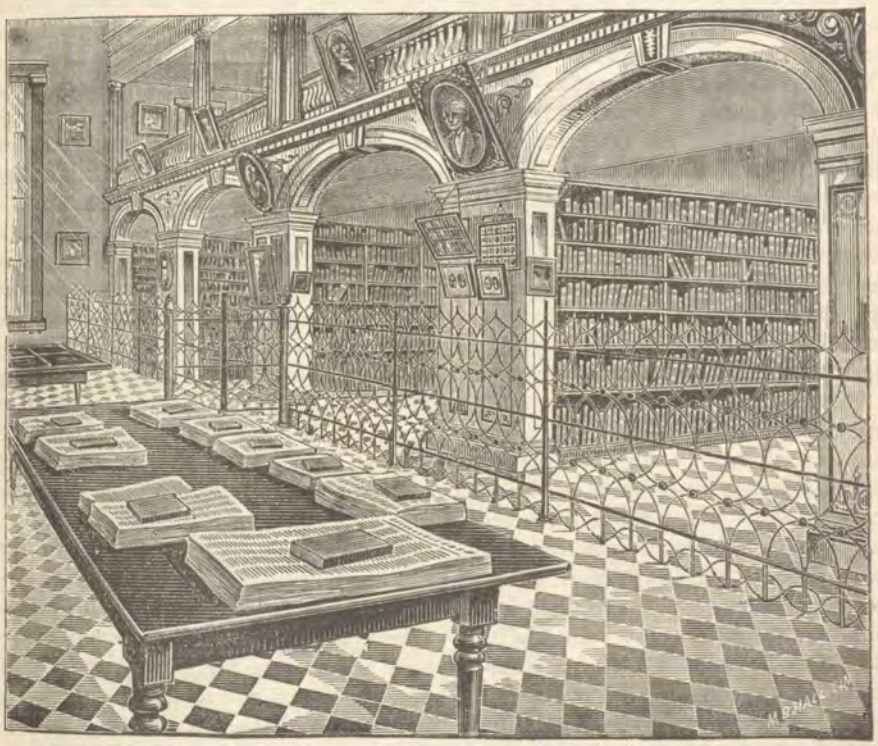
The courses of study embraced by the University curriculum are those which are offered to students by colleges in general, together with special departments in science and theology. It was designed as a feeder of the Methodist Episcopal ministry originally, but with its increased popularity it became adapted to the general purposes of a college, and is now conducted upon a non-sectarian basis, receiving young men of all creeds, and aiming to give them a full intellectual and moral education. By a very liberal arrangement of scholarships, its student list was greatly increased, there being in the institution, in 1851, five hundred and six, and until the breaking out of the civil war the enrollment annually was over five hundred. During the past ten years the average attendance has been about three hundred and fifty. The number of graduates is six hundred and fifty-two, of whom nearly one-third are in the ministry.

The site of the institution is attractive, and much pains have been taken to render the grounds—which cover thirty acres—sightly and picturesque. Delaware itself is a pretty little town of about 6,000 inhabitants, who exhibit much business enterprise; and as three railroads make the town the place of their junction, they contribute materially to its prosperity.

In closing this article, we add a few extracts from Dr. Payne's excellent address on assuming the Presidency of the institution:

"Our complex nature is one and inseparable in its grand unity of design. The entire being is to be educated for the entire work of life. Any system of education, or any individual education under any system whatever, is a delusive failure that does not recognize and constantly heed this primal fact. But more of this further on.

"We have said that higher Christian education is the special demand of the hour—as the safeguard of the nation.



"Few persons, probably, consider that there is any intimate relation between the college, where a limited number of youth are pressing their way up the loftier heights of learning, and the nation's prosperity.

"What has the college to do with the nation's growth, the nation's influence, the nation's safety and perpetuity? Much every way; vastly more than I can now command time to merely suggest. The educa-

tor, unrecognized though he may be, is the founder of States—the architect of national greatness. And by educator we do not mean one who teaches the rudimentary branches alone. Important as our public schools are, they are but a part of the great educational work necessary to the success and safety of the State.

"Without the coöperation of higher institutions they could not even exist; and their best work, noble and worthy as it is, is but the foundation of a structure to be completed by other and coördinate agencies. Our fathers, that noble race of manly men, who laid the foundations of our national greatness, recognized this fundamental fact and built grandly on it. The infant colony, with a combined wisdom, faith, and heroism that challenges our admiration, in their poverty and stress of circumstances founded Harvard College, and by that act changed the destiny of the entire nation. Its influence on the political, social, and literary history of the colony, and the independent State that arose out of the colony, can not be measured. The College of William and Mary, Yale, Princeton, and others soon followed, established with like breadth of wisdom and heroism of faith, and exerted their incalculable influence on the forming and future nation.

"How much this nation owes to these and similar institutions for its present heritage of freedom it is impossible to overestimate. Cornwallis well and truthfully said: 'The early establishment of your colleges hastened the Revolution half a century.' It not only hastened the Revolution, but made it possible and successful. Thus, with us, the college makes the State, not the State the college. And the college is not less an essential factor in perpetuating the State, with its free institutions, than in forming the same. Its influence is felt potently, not only by the limited number of youth gathered within its halls, but it

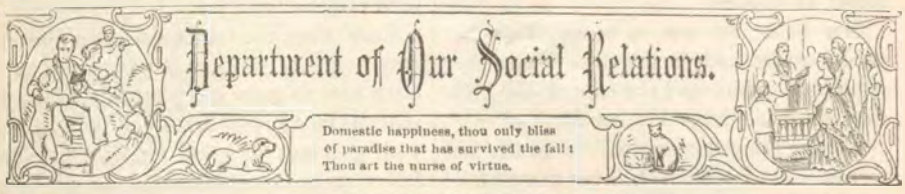
INTERIOR OF LIBRARY.

reaches out to the utmost circumference of society and fortifies the whole body politic. While it is developing the individual it is also shaping the policy of the nation; while it is forming the personal character it is forming the State; while it specially determines the future of the few it puts the stamp of destiny on the generation."

. . . . .

"I do not need to be reminded that education is a two-edged sword whose Damascene blade may be wielded for good or evil. Indeed, it is to this very fact that I would direct special and thoughtful attention. The peril of irreligious education—that is to say, of education which is purely secular—I apprehend is but too feebly felt even by the majority of Christian people. And that peril was never more imminent than to-day, for it frowns upon us with fearful menace from the high places of trust and power. Secularism is the popular dominant power, and religion is proscribed and forbidden to urge its transcendent claims outside its own sacred sanctuaries and chosen altars of devotion.

"It is of prime importance at such a time that we should re-state the (true) philosophy of education, and reaffirm the inseverable connection between true religions and true education. The real end of education, as already given with the authority of even such a writer as Herbert Spencer, demands that religion enter into it as a positive and ever-operative factor. If its function be to prepare us for complete living, how imperfectly is that function discharged when the intellect alone or chiefly is the objective point of culture, while the religious nature, which constitutes the basis of all "complete living," receives no specific training? Yet such is practically the fearfully defective education which large numbers of our youth are now receiving in this nominally Christian country.



"Viewed philosophically, the neglect of the religious element in education is a violation of every recognized principle of sound philosophy and every law of our being. If we consider the *object* of education, *character* is the culmination of all culture. *Esse quam videri.* Yes, *esse quam haberi, esse quam noscere.*

"*Being*—true, worthy being—is more than all *seeming*, more than all *having*, more than all *knowing*, more than all *doing*. And this thought is to be kept in view in every lesson and every effort of life, while from it will come strength and wealth of character inestimable. We are striving, if we are true educators, to make men not pedantic puppets nor cunning tricksters to practice scholastic jugglery on the solemn stage of life, tossing about its sublime verities as the cheap player does his balls and bells. Is it needful in this advanced century of the Christian ages that we should go back to the ancients to learn the true place of religion in education? We shall learn valuable lessons from Pythagoras concerning the blending of all true elements of character; Aristotle will teach us that what sculpture is to a block of marble, education is to a human soul, the educator bringing out the form of perfected beauty as the sculptor does the concealed marble figure; Plato will inform us that a good education consists in giving to the body and the soul all the perfections of which they are susceptible; Herodotus will tell us that when the Persians taught their sons three things only, one of them was to speak the truth; and Xenophon, in his Cyropædia, will introduce us to that pleasant and instructive picture of the Persian mode of education, in which we shall learn that the boys, until the age of seventeen years, were taught to know and to practice justice, and to entertain right sentiments toward the divinity, their country, their parents and their friends; and from seventeen to twenty-seven years they passed their nights in the public edifice, that their morals might be under strict surveillance. Pursuing our investigation along the track of the centuries, we shall find that in every system of education worthy a moment's thought, and in every stage of civilization, under every form of government, the culture of the religious and moral nature has been deemed of prime importance, however imperfectly the end has been secured. Are the men of our day, who practically ignore religious, if not, indeed, moral teaching in their system of educa-

tion, wiser than the aggregate wisdom of the past?

"See the soundness of our philosophy in another light. What does all education—as a work of research and acquisition—seek to compass? It is not truth; truth in its broadest reaches; truth in its entirety; truth in its relations; truth in its full-orbed brightness?

"What will this pursuit, honestly continued, bring its votary to but to God, the central source of all truth? Who can study the solar system without perceiving the relation of every inferior body to the central sun? All truth is correlated. There is a solidarity not of the physical sciences alone, but of all departments of human learning, all branches and ranges of truth. Put God in the center of your system, and all science and all philosophy fall into beautiful, harmonious order around the central, all-vivifying, all-illuminating figure."

OLD AGE BEAUTIFIED.

WE need not look shrinkingly forward to old age as a joyless and dreary season. What though the step be feeble, the once soft white hand wrinkled and trembling, the eyes dimmed, and brow crowned with the frosts of many a winter, the heart and mind will be the same that we hold today; and as we guard those, keeping them pure, storing up rich treasures of knowledge, enshrining friends within them, securing love, cultivating a good conscience, living at peace with all men, and above everything else, serving God and looking forward to an entrance into heaven; as we so guard our inner life, thus shall the end of our days be beautified. Keep the sunshine bright through the morning and long day of life; banish clouds of enmity, distrust, and peevishness, and when the twilight comes, how glorious will the sun sink to rest amid heavenly visions, until the whole west is resplendent in the light, and tells us with its long burning after-glow what a day of brightness has ended.

In the beautiful life of Mrs. Doremus, so recently gone from us, we have an example of old age beautified. Every day of her existence seemed to be spent for some one else; her sympathies were always ready to flow out toward others in their joys and woe. She took an active interest in every event of the day. One of the brightest faces among the visitors at the Centennial Exposition was hers, as she went from building to building, enjoying everything with that sweet, wise, childish heart. Then on her return, she would have her servants go one day, rising unusually early, that they might not be delayed, paying their expenses, and giving them something to spend for a few little mementoes. I shall never forget the bright sparkle of her eyes as she spoke afterward of the different objects which had interested her, saying, naïvely, "My dear, be sure to go to the Centennial!"

Her peaceful face, with its brow crowned with silvery hair, and her fragile form bent in the latter years of her life by debility and disease, were well known in our city. She could safely go alone among the roughest characters, her light step always greeted by blessings. Coming home unattended from a labor of love, one night, last winter, a friend met her, saying: "What! are you here alone?" "I am never alone!" she answered, with that smile which her friends so much loved.

For thirty years her name has been con-

spicuously connected with the principal charities of our cities; but not alone with mere local charity was she content. Foreign missions found in her a warm advocate and zealous supporter. Very seldom has a missionary sailed away from our shores but her sweet face has been there to bid him "God speed!" and to the returning ones her welcome has been thorough and loving. "How do you endure this terrible heat?" said a friend, in our hearing, to her one sultry day, last summer. "Ah!" she said, with her contented smile, "I keep hard at work, and forget all about it."

Her home life was as beautiful as her public career, and in the direction of her household affairs and the care of her children she was a marvel to her friends.

"Jesus, bring the chariot!" were her last words. Ah, on whom shall her mantle fall! Our vestals are going into silence, our queens are leaving their sceptres, our kings their thrones to ascend higher! Who can fill their places? Does this generation hide in its bosom souls as lofty, as impassioned, as inspired as those it has lost?

Old age can never be perfectly beautified unless in our youth we remember our Creator; it is then that our hearts are fresh and wide, no cares crowding out the vision of heavenly things; then is the best time to bid Jesus enter, and henceforth, we can say with her, whose life was so consecrated and beautified, "I am never alone!"

A firm religious belief makes life a discipline of goodness, builds new hopes when all earthly ones have vanished, and lights up the dark aisles of old age till they gleam with radiance and joy.

Since, then, the time must come when the rosy hours of youth will pass away, let us learn how to grow old gracefully, taking the years as they swiftly come, and twining them with garlands of good works which shall follow us as time passes and our feet totter, while locks grow white and eyes are dimmed; but the fragrance of the flowers will sweeten the gloom, and beautify the pathway, till it blooms a beautified second childhood at the gate of Paradise.

SARA KEABLES HUNT.

LIGHT IN DARK PLACES.

"This mournful truth is everywhere confessed,
Slow rises worth by poverty depressed."—SAMUEL JOHNSON.

CHAPTER I.

THE CONTRASTS.

"OFF with you, mizzle." Saying this, a stout, square-shouldered man advanced, somewhat briskly for one who was club-footed, from the hall-way of a tall building on Pearl Street, toward a group of half-grown girls and boys who were crouching over a large packing-box half filled with the waste and sweepings of said building.

Who has not often seen a similar group, as he wended his way down-town in the morning? The ashes, bits of paper, and miscellaneous accumulations of the day before having been swept up from the floors of the thousand stores and lofts which line the thoroughfares of great New York, are thrown into barrel, box, or tray, as the case may be, and that receptacle, with its contents, is placed on the outer edge of the sidewalk to await the coming of the cartmen, whose duty it is to collect such refuse. Scarcely has the waste-box been left at its customary place by the porter, than one or more of the street Arabs pounce upon it, like a vulture on carrion, and rake over the contents. The waste of some establishments is considerable and varied, and when it is set out, a contest ensues, frequently, among the squalid herd of chiffoniers, who have been awaiting it, as to who shall have the first dive into the dusty heap. We have seen a quarrel so fierce among a half dozen dirt and grease-begrimed urchins, over a few fragments of glazed paper and tinsel, the sweepings of a paper-box factory, that a policeman interfered and drove them away from the coveted rubbish.

"Off, I say," shouted the man, in a louder key, for the little vagabonds did not stir at his first command. But now, when he was almost upon them, they suddenly darted into the street, some with handfuls of the stuff they had been raking over. The man, or rather foreman of the bindery, to which this incident introduces us, shook his fist at them, saying:

"Let me catch you at this again, if you want your heads broken," and was answered by jeers, and groans, and tantalizing laughter, such as the wild street boy of the town is capable of. With a strong sense of irritation, Mr. Briggs turned and retraced his steps to the hallway, and slowly moved up the steep stairs to the loft in which destiny had given him a little authority over the daily work of forty or more girls and women.

Scarcely had he disappeared within the building when the little chiffoniers resumed their labors in the packing-box, and one of them, a boy of twelve, with blue eyes, a wealth of brown hair in disordered masses, and features whose refinement of expression was heightened by the luxuriant hair, said to his neighbor—a boy who rejoiced in the possession of a pair of pantaloons which formerly had doubtless formed part of the wardrobe of a Lambert, and which had only been shortened in the legs—"Bumpy, who cares for old Briggs? I know him. Don't our Sadie work up there? I guess she does, and old Briggs' mighty sweet on her. I heard her tell mother all 'bout him."

Bumpy rejoined, raking away all the while: "Briggs, stiggs, pigs, who cares fur ole Briggs? He's nothin' anyhow; hasn't leff anythin' for us here that's wuth pickin' up. He's an ole fraud. Woolly, less go ter some other pile."

It was in the third loft of the building where the chief part of the work of the bindery of Blossom & Gaff was done. A long, low-ceiled room, imperfectly lighted, and worse ventilated, contained at that hour of the morning—8 o'clock—nearly the full quota of hands who repaired there day after day to earn their scanty wages. There were between forty and fifty women busily engaged in the different processes of book and pamphlet binding. Some were evidently well on in years, while the majority did not exceed twenty, but irksome confinement had told on the features of nearly all. In a recess close to the rear wall of the room sat a young girl, of not more than seventeen. The heavy masses of rich brown hair which rippled down over her shoulders, and glistened in the passive light of the room, would instantly have reminded one of the boy at the ash-box, had he seen him and soon after passed up into the bindery. The same profusion of hair, the same delicate tint of complexion, the same dark eyes, marked "Woolly" and "Sal" as brother and sister; but the latter possessed that rare organization which preserves, even amid care and poverty and toil, the rounded outline and physical symmetry of those born

SADIE.

to easy ways and comforts. She was not a novice at her business, as well appeared in the deft method by which she joined the folded sheets and gave the book on which she was working its form. Within a dozen feet of "Sal" sat a young woman of totally different mold. Tall, wide-shouldered, and bony, her features were coarse and marked by that terrible disease so destructive to beauty, small-pox, and her hair was black and coarse and singularly stringy. Her large, masculine hands seemed well fitted for the work she was usually given, the binding of large volumes—not the finer grades of work, but the common sorts we meet with in the cheap octavo editions of standard authors, or the cloth-bound volumes of monthly magazines. By no means neat in her dress, like "Sal," she neverthe-

less appeared to appreciate the needs of her calling in the strong dark cotton fabric which composed her "suit." "Sal" showed not a little native taste, but the shortcoming in its appropriate exhibition was due to the very limited capacity of her purse.

These two "work-women" were close friends, strange as it may seem, and yet it is not so strange when we consider the possible supplementing by one what was wanting in the other; how "Betty's" powerful motive organization, and familiarity with the rough phases of life contributed physical inspiration and not a little protection to "Sal"; and how "Sal's" sensitive delicacy and generous zeal smoothed over many of the asperities of "Betty's" nature. Their origins were as different as their dispositions and appearances, yet poverty, which levels distinctions, had brought them together, and they were to each other in their street and work-room experiences very helpful.

CHAPTER II.

A WORKING-GIRL'S ANNOYANCE.

Six o'clock had been sounded by bell, whistle, and gong, and the many factories and business houses had dismissed their employés. The streets were thronged with men and women, boys and girls, hurrying homeward; many with heart or head filled with emotions excited by incidents of the day; some bearing carefully matters of pleasing interest, to be told to the little circle which awaited their coming ere the evening meal was partaken of. "Sal" and Betty were among the homeward bound, walking together, as their homes were but a square or two apart, and discussing with rapid tongue events of the day. By "Sal's" excited manner it was evident that something more than ordinary had occurred. Perhaps their conversation may give a hint of its nature.

"Young Gaff 'peared kind er sweet on you this a'ternoon," said Betty. "But you'd ought a seen that Briggs, how sour he looked over there when Gaff was a talkin' to you."

"I'm sure," exclaimed Sal, "I can't stop the bosses from speaking to me if they will. And Briggs tries to show so much of his authority whenever Mr. Gaff has been among the girls. To-day he was really impertinent. For when Mr. Gaff had gone, he came over and just as much as told me that I had no business to be talking to Mr. Gaff."

"What a fool!" said Betty, indignantly. "He must think that he owns yer. I'd give him a bit of my tongue ef he dared to insinivate anything of the kind ter me. But 'twont do for you, my lass," (and here Betty put on the tone of motherly counsel which she deemed her age and long experience in the world warranted in this relation) "to be sassy or impudent to Briggs, 'cause he's the foreman, and knows more 'bout the business than the bosses theirselves. Lor', child, he's old 'nough to be yer father, and jest you keep quiet like, and make no fuss, 'less he wants to go too far. An' I don't think he'll do that. Some of the gals have been foolish, thinkin' that when they showed a likin' to Briggs he'd be showin' them favors, puttin' up their wages. But no such thing come of it. The ole man Blossom has the regulatin' of the wages, an' he's as sharp as a cold-chisel when money's on the carpet. So you jest keep putty quiet and work along, sayin' no more than you must."

"But, Betty, I think I can get along pretty well with Briggs; it is Mr. Gaff who really annoys me most. He's married; has a real nice wife, the girls say; and yet he has said things to me which don't look well for a married man. Why, to-day he actually invited me to take a ride with him Sunday afternoon to the Park."

"What! you don't say so, Sal! Of course yer didn't give him no oncouragement?"

"No. I told him my mother did not care to have me go out for pleasure on Sundays. Besides, I was in the Bible-class at the Mission, and I went to that afternoons. Then he said that he would be glad to take me some other afternoon or evening, and I hardly knew what to say at first to that. But as he asked me to say when I would go, I told him that I had never gone out with gentlemen alone, and would ask mother about it."

"Well, I'm beat. I know now why he

sent me into the paper-room for that twine which I couldn't find. That's what he wanted to say to yer, and he didn't want me to hear—the sly fox! I guess yer mother can give yer good advice on the p'int, and 'taint no use for me to put in a word. Well, here's my den, and you must hurry straight home;" and giving her young work-friend a very earnest clutch and kiss, Betty turned down a narrow lane, while "Sal" tripped on, soon compassing the hundred yards more of distance which lay between the point of separation and the five-story tenement in which she dwelt.

CHAPTER III.

TABLE-TALK—RECTITUDE.

Up three flights of stairs into a back room rushed "Sal." The door had been opened slightly by the expectant mother, who received her beautiful child in her arms and held her closely embraced for a few moments. She was not "Sal" in that humble abode, but a name which brought memories of a very different sphere burst from lip and tongue of mother, brother, and little sister Dell—"Sadie!" The polished manner, upright yet easy bearing and refined language of that mother declared her birth. There was much the same symmetry of form and feature, and the same luxuriance of hair, though of darker hue, which characterized Sadie, and Norton, the boy, whose street title, as we learned in the first chapter, was "Woolly." He was there sitting by a window which overlooked the squalid and promiscuous view of a tenement's rear, listlessly drumming with his fingers upon the sill. While little Dell, whose dark hair and olive complexion intimated the possession of a degree or two more of the lost father's temperament, sat in her high chair at the table, eager for her portion of supper, yet shouting with delight at the coming of "Sister Say."

A minute more and the four were seated at the little table, and after Mrs. Camp's brief, but fervent grace—"Bless, O Father, this food which Thy providence has provided, that its use may give strength to our bodies. Amen."—the frugal meal was begun, and lively tongues broke forth in pleasant accompaniment to the jingle of knife, fork, and spoon. Norton and Sadie talked of what they had seen and heard that day, now and then asking for explanations of what seemed unusual or mysterious in them, and Mrs. Camp warmly entered into their lively, desultory talk, giving useful suggestions and practical counsel here and there, as circumstances warranted. It was in these meal-time talks that much valuable instruction was imparted by the lady, whose former position and special inclination had conduced to the storing of her mind with useful information. She had in girlhood found more enjoyment in the study of language and science than in acquiring the so-called accomplishments of music, dancing, embroidery, etc., and now in her poverty she found deep solace in the fact that she could instruct her children in many things which they could learn otherwise only in the high school or college, which they were debarred from attending by circumstances.

"Mother," said Sadie, "these gems are just splendid. You know those I took to Betty for her sick brother? Betty said her mother wouldn't believe that they were made with only wheat-meal and cold water. She declared it was impossible to have them so light without yeast. Betty thinks her mother is a famous bread-maker, and some of her bread, which I've seen, looks very nicely, like the baker's, but it smells so sour. Why is it, mother?"

"Simply the yeast she mixes with the dough. That is sour, and in the process of fermentation more sourness is developed, because the rising of the dough is due to the bubbles of carbonic acid gas which pervade it. I have heard people often speak of the sweetness of their yeast-raised bread; but I think only those who have eaten good unleavened biscuit and bread know what is meant by the words *sweet* bread."

"I suppose that people who are used to such bread as the bakers make don't notice the sour taste and smell as we do."

"No, my love, I used to think that the baker who supplied us at father's made the best bread in the world. I thought that it was necessary to put yeast in to make bread at all, and laughed, just as people do now,

at the idea that it could be done. But when I had a taste of a well-made 'gem' I noticed the difference in quality."

"Who taught you, mother, to make such bread?" asked Norton.

"I learned of Mrs. Wilson, at Dr. Wilson's Hygeian Home, where I lived once for six months."

"That, mamma, must have been a great many years ago," said Dell.

"It was but two or three years after Sadie was born, darling."

"What were you doin' there, mamma?"

"I was very ill, my Dell, and your dear papa wished me to go and receive Dr. Wilson's treatment. I went and found that my ill health had been occasioned mainly by the way in which I had been living. Like too many people in the world, and nearly all around us here, I had been eating things which were not good for me, and acting right the contrary to nature in many respects, although I thought I knew more about what was right and proper than most women."

"And you did, mother," exclaimed Norton, who had a profound reverence for his mother's learning.

"Yes, like many, I knew better than I did, and I didn't wish to appear odd and out of keeping with my friends and acquaintances. My dear children, always do what is right and true when your own health and character are the main things to be considered. Don't allow yourselves to be turned away from what is proper by the laughter and ridicule of others."

"I tried hard to do right to-day, mother," said Norton, "and I think I come pretty near it."

"How, my dear boy?"

"Why, you see, Bumpy, that boy who lives up the alley, and me—"

"*I*," corrected Sadie.

"Yes, Bumpy and I—"

"What a funny name—he, he!" put in Dell.

"Yes, all the boys call him that. I don't know his other. Well, Bumpy and me—*I*, I mean—were poking in a barrel of stuff down in Perry Street, when I hooked out a big lot of waste paper—newspapers—all jammed together, and *awful* heavy."

"My only boy, can you not avoid using such words?" said Mrs. Camp.

"It's so hard, mother, you know, when all the fellers—boys, I mean—use such bad words, to keep from using them too."

"I know it, indeed, my poor child," replied the sympathetic mother, with an inward sigh, "but sometime we shall find a better home and other associates than the poor and unfortunate ones here, and then would not such talk, if you get into the habit of using it, be very much out of place?"

"Oh, mother! shall we ever have such a home as we had when I was little? Do you think we shall?" asked Norton, with gleaming, anxious eyes.

"In God's own time 'twill come, I'm sure; but let us hear the rest of your adventure."

"Well, I gave what other stuff I'd found to Bumpy, and shouldered the bundle of paper. Bumpy said there might be something inside, and I'd better undo them. So we went into a back lot and I looked through them, and near the middle I found a little box in which was a round silver thing like a medal, and on it 'James Stanley.' I told Bumpy that I was going to carry the medal and papers back to the place where I found them. And he called me a 'big fool,' and that 'the medal wasn't worth much anyhow, and I'd get a quarter for the papers down at O I C's.' Well, I took them back to where the barrel stood, and up in the building I saw a sign, 'Taylor & Stanley.' So I knew that was the place to ask, and I went up-stairs and knocked at the door. Somebody said, 'Come in,' and in I went. I asked a man with a big lot of whiskers on his face if I could see Mr. Stanley, and he said, 'That's my name.' Then I said, 'Here's something I found in the barrel on the street this morning,' and handed him the box with the medal in it. He looked inside and said, 'Oho! why, how's this?' and then took me into a little room back of the store part and asked me ever so many questions about how I came to find it, and what my name was, and where I lived, and whether I had any father or mother, and put down in a little book which he took out of his pocket a good many things, I s'pose what I'd told him."

"Stanley, Stanley," said Mrs. Camp. "It seems to me that I have heard that name somewhere."

"He was a real nice feller—man, I mean—mother, though he had such big black whiskers. An' he told me that the medal was his; 'twas given him when he was a boy for good conduct and knowing his lessons a whole year at school, and he wouldn't like to lose it. And then he told me I might have the papers, and could come every day and get the waste stuff if I thought it worth while. And I tell you, mother, it's bully—there, I didn't mean to say that!—it's a good place for such pickings. I saw ever so many bits lying about; and the clerks were sorting over things and throwing the covers down. Then I went down and sold my bundle of papers for twenty-seven cents, and here it is, mother."

"You did nobly, my precious boy, and you may find that this day's action, although its money's worth does not seem great, will bring about some happy result for you; and I'm sure you must feel right glad about it."

"I do," said Norton.

"And, mother," said Sadie, "perhaps it will help to give Nortie a nice place, where he can get wages, and not have to run about the streets to find little jobs and pick up what he can. I hope it will."

"Oh, I'm so glad, too," said little Dell; "p'raps the man with the great big whiskers will be a papa to Nortie."

The older ones laughed merrily at this sally of Dell's, and a gleam of happiness brightened their hearts, and suspended for the moment the realization of their poverty.

H. S. D.

(To be continued.)

HELPS TOWARD BEAUTY.

"Where does beauty's center lie,—
In the heart or in the eye?"

IF in the heart, then there must be something to please the eye, or admiration is lost in regret; if in the eye, then the soul must speak to the eye, or the charm can not last. Beauty appeals to the cultured taste, not in part, but as a whole. One's highest ideal must be approached, if not fully realized. A flaw or incongruity may so mar as to pain instead of pleasing. Man first seeks to please the eye, and then to satisfy the heart. He is fascinated with a pretty face, and in imagination endows it with all of the qualities of mind and heart which he deems most essential to complete the picture; but in vain he waits for some demonstration of these sentiments, until familiarity reveals prominent defects of character, and his admiration is turned into pity or contempt.

Some of our great men have chosen their wives from the belles and beauties of their clique. They sought to please the eye before the eye was sufficiently cultured to recognize real beauty, and their life-work had been trammeled for want of that appreciation, companionship, and support which only a wife can give. A gentleman in Vermont, on one occasion, when mortified by the weakness displayed by his wife, as she left the room, made the humiliating remark, "My wife is pretty, if she is a fool." When the greatest men—those who would make the most desirable husbands—show such weakness in the choice of wives, and when women are educated to look upon marriage as the chief object of their existence, is it surprising that women resort to those artifices calculated to make them acceptable in the best market; or that men, having chosen a pretty face as their ideal of womanly perfection, should form a low estimate of her? In a public speech, Calhoun made a sweeping remark in reference to the weakness of woman's character, whereupon Gen. Butler arose, and, apologizing, said: "Calhoun speaks from the class of women with whom he associates."

Ladies have been told that ill-health made them look interesting; and, with the view of appearing refined and delicate, they have

excluded the sunlight from the drawing-room, and veiled the face, like some sensitive exotic, whenever exposed to the out-door air, and when the effect is not perfect they charge Nature with having given them poor skin, and use all manner of cosmetics to cover the defect. One Sunday, at church, my attention was called to a young lady who ate cloves to make her skin white, and my companion said: "Doesn't she look *awful?*" In less than a year I was told that she had died from the effects of eating cloves. It is but a short time since the small, wasp-like waists were considered perfection of form. A man was proud to say he could span his wife's waist with his two hands. And, to attain this model form of beauty, tight lacing became the rage. The form must be pinched to the least possible size. A beautiful figure was desirable at any cost; and, on the principle that "one might as well be out of the world as out of fashion," many lives have been forfeited, and many constitutions wrecked. You have only to compare the fashion-plates of to-day with those of a few years ago, to see the change that has been wrought in the estimate of female beauty. Woman never had the opportunity to study anatomy and physiology until recently, and now she is beginning to comprehend the structure and use of her own body.

That "knowledge is power" was never more aptly applied, for it is the only power that can redeem the world from its follies. In proportion as woman has had an opportunity to gain practical knowledge, she has not been wanting in tact to apply it. She can now realize that a fully-developed waist enhances the beauty of the whole person, and is a necessity to grace and ease of manner, and gives a healthful, magnetic influence. One must comprehend a tangible reason for the fatal consequences of error before he can make the necessary effort to save himself. The principles of phrenology and physiognomy, by educating the mind, have enlarged our conceptions of true beauty in the "human face divine," and man is no longer the dupe of a pretty little mouth and doll-baby face.

Beauty speaks not to the eye alone, but to the intelligence; and to those of taste, culture, and penetration of character, prominent and well-defined features, instead of being ugly, are considered marks of beauty, because they portray strength and efficiency of character. As the mind develops under the light of progress and culture, it demands the real, and naturally supposes the artificial to conceal some prominent defect. Sunlight, out-door air, and exercise, are Nature's beautifiers. They impart the glow of health, which is far more fascinating than the finest tints of cosmetics.

The following is supposed to be the prayer of a plain woman: "I would be beautiful, not to attract the gay world's gaze, nor to mingle in its proud throng, to whom all offer homage; but I ask the beauty of a pure and noble mind, whose ornaments are simplicity and truth, to sympathize with others in their sorrows."

Yes, ask the beauty Nature gives, and you will attract the gay world's gaze, though you mingle not in its proud throng to whom all offer homage. Seek health, and your beauty will be a rare type, which combines with a pure and noble mind, and will adorn you with simplicity, a cheerful face, and a happy heart, to carry sunlight to the hearts of others.

MAY CHAPMAN.

AN EXPERIMENT.

"TO go, or not to go, that is the question," said bright little Mrs. Gregory, one August morning at the breakfast-table.

"Go, by all means," said the husband, breaking a roll.

"But it is so much work to get ready. I don't feel well enough to make the effort."

"Don't be foolish, Emma; you will be well enough, as soon as you get out of this house; you haven't eaten enough to keep a chicken alive, for the last week; you are tired out with care and monotony."

"If we could go straight off without getting ready," I said, "there would be some fun in it."

"You can if you choose. Women make

half their troubles; pack a traveling-bag, and start to-morrow afternoon." Emma Gregory looked wistfully into my face.

"I will, if you will," I said. "We have been school-girls together, and many a wild frolic have we inaugurated, without stopping to 'get ready.'" I saw by the brightening of Emma's eyes, that the old spirit was rising.

"Do you really think we could go off that way?" she asked.

"Of course; what is to hinder? Surely we dare do it. You are not afraid of Mrs. Grundy, I hope."

Emma's spirit was piqued; to suggest that she was afraid of anything or anybody, was to put her on her mettle.

"I'll go," she said, with an emphatic toss of the head; "but we've not a minute to lose!"

Already I felt myself stimulated by the mere thought of a hap-hazard journey. No trunks, and no destination! How delightful; as for Emma, worn out as she was, she ran, singing, up-stairs, gayer than I had seen her for weeks.

"I've made out my programme already," she said, when I followed her, a few minutes later. "My second best black silk skirt, with gray over-skirt and basque for traveling, linen duster, and water-proof in shawl-straps, for emergencies, a bag containing linen, under-collars and cuffs, handkerchiefs, and a couple of nansook over-dresses, for hot mornings. A hat, half rustic, with a scarf of veiling, two or three paper-covered books."

"Brave," I replied; "we might start in two hours, if we choose. The only trouble will be how to pass the time between now and to-morrow afternoon."

"Won't it be jolly," exclaimed the little woman, ignoring my remark altogether. "We will go up the Hudson to-morrow night in the moonlight, and enjoy it as we used to do when we were on our way to school."

Well, we carried out our plans to the letter. We packed according to Emma's programme, started for Albany on the *St. John*, and forgot the moment we were in sight of the Palisades, that we were getting toward middle-life, and had responsibilities. As we steamed along, watching the soft, rosy light on the green landscape, Emma said: "I shouldn't have taken any journey this summer, if a fortnight's dress-making had been the condition. But I never dreamed that we poor slaves could snatch freedom at this easy rate."

"'Who would be free, himself must strike the blow,'" quoted I, rousing from a revery. We floated on; the pink light faded out; the dusk deepened, and the crescent moon shone in the blue heavens. All the little waspish cares that had stung us into irritation, had been left behind in the hot, worrying city. How insignificant they seemed, now that we were out of their reach. How strong our spirits had grown already, in this new atmosphere, with nature's peaceful beauty winning us so tenderly. We were silent a long time, really and truly resting. Every moment we grew more refreshed, more in harmony with the serenity of the night, a long time communing with our own hearts. The moon sank toward the Highlands, and lost itself behind the highest peak, to emerge again with weird effect, as we passed on.

"Why don't we do this oftener?" burst out Emma at last, in her abrupt way.

"Because we are fools," I said, "and wisdom is not in us."

We went on planning then for the rest of our trip, and before we went to sleep, we arranged a card something like this:

From Albany to Saratoga, where we have friends, living in a quiet cottage; draughts of mineral-water, and as many drives as we wish; the Adirondack Railroad and stage to Schroon Lake, a trip across the lake to Schroon village, where we have friends again; a private conveyance through the wooded roads, from point to point, to North Elba; a few days in the wilderness, if we meet the right party; Lake George; and home.

All this we carried out, and the namby-pamby creatures that started for Albany on a certain hot night, were lost somewhere on the road. Certain it is, they were not seen again that summer.

MRS. M. F. BUTTS.

YOUTHFUL DISREGARD OF REPROOF--ITS TENDENCIES.

"THAT boy will break my heart!" was the passionate exclamation of a respectable-looking woman, as, with an appealing look, she addressed a strange gentleman who passed by at the time. A large, overgrown boy, of more than fifteen years, had leaped over the fence a moment before, and now, feeling himself beyond her reach, stood laughing defiantly at his mother, who had undertaken to reprove him for some mean conduct. Without making reply, the stranger turned a severe look upon the boy, which had the effect of checking his mirth and changing his color a little, and then advancing to the rails, and resting his arms upon them, related the following story, which might have been profitable to both his hearers.

"There is, perhaps, nothing more painful than to see children, and especially large boys, who ought to know better, uncivil and disrespectful to their superiors, but particularly so to their parents. When I was a boy myself, I regret to say I fell into the very same sad fault, for which I was not alone blameworthy. I was considered remarkably smart for my years, and my singularly wise sayings and doings delighted admiring friends—I suppose I was looked upon by my parents as a young Solomon. They generally brought me into the parlor for the express purpose of entertaining company. But I remember that I was wise enough to understand and mark well all the praises they heaped upon me. All my wisdom was gathered from my friends, and yet they gave me credit for originality in everything I said or did. By these aids I soon discovered my great importance, and this made me very impertinent—a pest and a scourge to my parents.

"When I had grown up to the age at which I ought to have been a pleasure to them, I was disobedient and sadly disrespectful. When I think of the irreverence I was guilty of, and which they tolerated in me for a moment, I feel to this day crimson with shame. And if I thought it could make amends for my youthful vileness, I should like to undergo now the floggings which I ought to have received then. I was permitted to call my father such slang names as 'governor,' 'the boss,' 'the old man,' 'John,' and such like, to his very face, and he heard it good-naturedly, and laughed. The most sacred of all names, mother, was seldom applied to her who loved me more than any other human being. I usually called her 'the old woman,' or 'Mary,' humorously, of course, and thought it sounded well.

"This bad training showed on me everywhere else. At school, the teacher was a firm man, a first-class disciplinarian, and kept me in my place well; but I disliked him for what I styled his severity, and behaved as disrespectfully and disobediently as I well dared. I was afraid of an open conflict with him, knowing that, in that case, I must have fared poorly. In secret, however, I did what I could to disaffect the other scholars and make them disrespectful. In this I succeeded admirably, especially among the larger boys. We could all plot mischief against him, and sneer at him behind his back. His rebuke made us angry and revengeful, and we consoled ourselves with the hope of paying him for it when we grew up. In the meantime we enjoyed ourselves delightfully in making game of him, much to the entertainment of the scholars. I was the prime mover in these annoyances, and it never occurred to my mind that my heartless conduct would receive a sudden and unexpected check.

"On one occasion he reproved me. Thinking myself master of the situation, I tossed my head in defiance, and sneered contemptuously, looking for the approval of my rude companions. But before I had time to think what I was doing, the teacher made my ear ring with a blow of his open hand. I staggered a little, but instantly recovering myself, and shrugging my shoulders in contempt, dared him to repeat it. He commanded me to leave the room. Glad of the opportunity, I went, and closing the door with an impudent farewell, ended my school education.

"In Sunday-school I was even worse. I knew that my teacher had no means of en-

forcing his instruction except by moral suasion. I was irreverent, even in the most sacred things. I turned my pious teacher's instruction into ridicule to make the others laugh. More than once I used bad language to his face, and I am now convinced that he was a man of more than ordinary grace, or his temper could not have brooked my conduct for a moment. Yet strange to say, I never knew of his having made any effort to obtain my removal out of his class. I think his prayers were answered, however, by my suddenly leaving the place. I went to business, and was there but a month when my bad manners were directed toward my employer. He told me quietly that I might go home to my father. I went. I tried several other places, with a similar unhappy result—*unhappy* for me; *happy* for my employers.

"I had now grown to be a young man, and knew that I was losing my time, that I could never be worth anything in the world. In weeks of despondency I had time to reflect. I saw that I had been turned out of school for my insubordination; that I had been disrespectful to my Sabbath-school teacher, though he desired my best interests; that my ill-breeding had turned me out of three or four situations, and prevented me from ever occupying others. I next saw that if I ever expected to do well, I must govern my temper, suppress my insufferable pride, which had developed by this time into imprudence, and practice obedience and respectfulness to my superiors. The disgrace of having been turned out of several situations, to the certain knowledge of my acquaintances, mortified me. To friends I explained when opportunity afforded, that it was not my fault, but that of tyrannical masters; but no use; they had their own opinion, which was the correct one. My ill-fortune had its good effect upon me. After the exercise of patience and practice of self-culture for a long time I succeeded in obtaining another situation. When entering upon it, I made up my mind to try better conduct, and be as respectful as possible to all around me. I was able to keep my place this time, and learned that steadiness, honesty, and respectfulness to superiors were indispensable to a young man's success.

"Young man," he continued, "if you wish ever to prosper in the world, you must begin by obeying the Fifth Commandment, which is, 'Honor thy father and thy mother, that thy days may be long upon the land which the Lord thy God giveth thee.' If you neglect this, take care that you come not under the curse which declares, that 'The eye that mocketh at his father, and despiseth to obey his mother, the ravens of the valley shall pick it out, and the young eagles shall eat it.'"—*N. Y. Observer.*

A TEMPERANCE RALLY.

LET us rouse with one great effort
And dethrone the rebel king!
He has bound us down to thraldom;
Let us off the shackles fling.
Let us be a free, free nation—
Rise above king Alcohol.
Let us pray, and pray unceasing
For his everlasting fall.

Let us labor! Faith and labor
Must at last win sure reward.
Every bondman is our brother.
On to battle! prayer for sword.
Gather, gather to our army
Youthful, aged, great and small,
That we gain a glorious victory
Over old king Alcohol!

Let us prove by patient pleading
How we love his subjects, slaves.
Let us gently, firmly lead them
Up to where redemption saves.
Let us all the tippling customs
Frown upon and trample down,
Until every man's a freeman
Waiting an eternal crown.

S. L. OBERHOLTZER.

THE BEST FRIEND.—The most agreeable of all companions is a simple, frank man, without any high pretensions to an oppressive greatness; one who loves life and understands the use of it; obliging alike at all hours; above all, of a golden temper, and steadfast as an anchor. For such an one we gladly exchange the greatest genius, the most brilliant wit, the profoundest thinker. —LESSING.

Department of Literature, Science, Education.

True philosophy is a revelation of the Divine will manifested in creation: it harmonizes with all truth, and can not with impunity be neglected.

WHAT IS THOUGHT?

THE idea embodied in the word thought, like the idea embodied in the word life, while it conveys to the mind of him who hears it a certain definite impression, is an intangible something which we can realize as an entity, but which defies our efforts when we seek to imprison it in words. All attempts thus far to frame a definition of life that shall truly describe it, have resulted only in the presentation of a few striking phrases that require a long explanation to render them clear and intelligible. And to seek to define thought as fancy, reflection, idea, or by any other term, is only to substitute one word for another without apparent gain.

Yet thought may be regarded as the total outcome of the action of the brain, as life is the total outcome of the forces evolved by the tissues of the organism; but this view does not explain what thought is, and leaves the interior process as obscure as before. When we can know what thought and life really are, we will have solved the mystery of being—passed beyond the veil that shuts us out from the great unknown.

There is no other path of investigation, or branch of scientific research, which deals so intimately with our essence, with the inmost I am, as that which studies the processes of thought; that seeks to unravel the why and how of the brilliant play of fancy, or to explore the minutiæ comprehended in a train of reasoning, and none which offers more fascination to the naturally reflective student. From the earliest time the operation and working of the mind have been a favorite subject of speculation, and to none more than to those who, ignorant of the composition and structure of the organs of thought and of the laws which govern its action, have only succeeded in befogging and involving in greater mystery an already sufficiently obscure subject. In the primitive ages, and for a long period thereafter, thought was held to be (as was certainly a natural conclusion on the part of those who could not conceive that anything so intangible and fine as the mental manifestations could have their birth in the gross material) the direct inspiration of invisible spirits, good and bad, which surrounded man. And the same idea runs along the record of the race down to our own time.

It is now generally conceded, by rationalists, that thought, under which head we include all the functions the brain is capable of exercising, as judgment, will, fancy, memory, etc., as formulated into words or actions, is the result of the physical action of the brain cells. It does not seem possible to conceive of it as being simply automatic, and yet this is what we must come to, if we accept a merely materialistic view. That the brain is amply sufficient to formulate into words or actions the shadowy conceptions that rise, there is no reason to doubt; but from where and whence do these shadows come? Is there not, must there not be, back of the brain, considered as a mass of nerve cells and fibers, a real *ego* that makes the individual and controls this material agent?

The nervous system of animals, and we might add of some vegetable organisms as well, is constituted like the other tissues that go to make up their entire structure of cells of varied forms. But we may, in general terms, consider it as consisting of nerve centers for the generation or the receipt of impulse, and of nerve cords for the

transmission of the impulse, received at either extremity. In the lowest animals this is all there is of it: one or more ganglia or nerve centers, from which radiate two or more nerves or cords, and this low form of nerve apparatus may be sufficient to carry on the one function of such life, nutrition. But as we rise in the animal scale, the ganglia increase and begin to group themselves around definite centers. The nerves become more numerous, until we find the ganglia becoming endowed with special functions and forming the organs of special sense, and uniting to form a brain. In the brain of a fish we have very little else than a series of these ganglia, one pair belonging to each principal organ of sense. Thus we have in front the ganglia of smell, then the ganglia of sight, then the ganglia of hearing, and the ganglia of general sensation. These constitute almost entirely the brain of the fish. There is scarcely anything in the brain of the fish which answers to the cerebrum of man. The cerebrum in most fishes is a mere film overlaying the sensory tract, but in the higher fishes we have it larger; in the reptile we have it larger still; in birds we have it still larger; in the lower mammalia it is larger still; and so, as we ascend to man, this part increases in volume and complication.

The experiments made upon the lower animals by the removal of the cerebrum, as well as the dawning and gradual growth of the intellectual faculties as we ascend in the scale of life, from the fish to the higher mammalia, all tend to locate the seat of the higher, intellectual faculties—thought, will, and consciousness—in the cerebrum. The cerebrum is, in fact, the brain, and the underlying ganglia are but the machinery through which the outcome of the brain finds expression—the seat of automatic reflex action, the irritation from the brain proper being one of the *stimuli* to which it is their function to respond. We shall thus be led to consider the actions of all animals below the grade of the fish, wonderful as they are, and simulating so accurately the manifestations of a reasoning entity, as entirely automatic; as simply reflex action, initiated by an irritation at the peripheral extremity of the nerve. If this be the case—and all the evidence thus far collated goes to support it—the question arises: "If the seat of thought lies in the cerebrum, when and where in the animal creation does consciousness and personality enter in?"

We do not credit to the plant, or to the protoplasmic representatives of the animal kingdom (the inhabitants of that borderland in which both animal and vegetative life take origin), a personal consciousness or identity, any more than we do to the simple cells that enter into the formation of bone. Then at what point, and how, does the consciousness of being enter in? Does it come to some animal as a sudden burst of personality, or does it grow up gradually from a shadowy something, a shade of feeling, a mere film of consciousness?

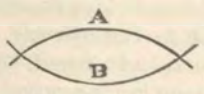
It is a difficult thing to conceive of any personality either greater or less than what we enjoy, yet there must be both; and we would incline to the opinion, from the analogous increase of the other faculties, that below us the sense of consciousness fades gradually away, until the animal becomes an animated machine, performing its various acts in obedience to the various *stimuli* received from without.

We find the brain in man, the culmination of the nervous development, to consist, in addition to the sensory ganglia, of a mass of white fibrous tissue, overlaid with the gray ganglionic, and folded into numerous convolutions to increase the extent of surface over which the gray matter is spread, and that such increase is attended by a corresponding porportional increase in mental power. In the gray matter originate all the impulses which the white convey, but how yet remains a mystery. We know that in the ultimate cell originate all the actions of the organism, and in the brain cell nerve force begins, brain cells being the ganglionic cells, as a ganglion is a miniature brain; and it is doubtless through a re-arrangement of the position, or of the polarity of its molecules, that the force is evolved. It is believed that the transmission of a nervous impulse along the course of a nerve is effected by an electrical change in the position or the polarity of the atoms or of

the molecule of the cells; and this view finds considerable support in the observations made upon some of the "carnivorous plants." "When a piece of meat or an insect was placed upon the leaf of the plant, it was found that the transparent cells passing from the leaf through the stem, re-arranged themselves from the point of impulse inward, and that after such re-arrangement the movement took place." But this observation only shows something of the way in which the actions generally admitted to be automatic, are brought about. In the action of the leaf in closing upon and imprisoning the disturbing cause, we have a certain reflex action arising from a certain stimulus.

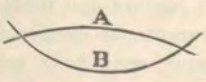
It may be that we have here the rudiment of the nervous system, which is to be developed through the chain of animal life until it ends in the complex brain of man; but as yet there is no trace of any reasoning power, nothing that indicates the presence of an *ego*, or of a conscious individuality in the plant. In the higher forms of animal life the automaticity of many actions remains, but they must be held the result of conscious or unconscious education. The hand of the skilled artisan that moves so deftly in the execution of its accustomed work, does it easily and gracefully because the nerve centers have been trained by years of conscious effort under the direction of the will, until the impulse generated by the accustomed stimulus sets in motion the usual train of actions, and it is carried on in obedience to the law that "Force moves ever on the lines of least resistance." Setting aside the consideration of the action of certain centers, such as those presiding over the functions of organic life, and which are not pertinent to, or involved in, an inquiry into thought, we must accept the conclusion that the present state of knowledge upon this subject does not warrant us in believing that the brain is sufficient in itself to produce all the mental phenomena, and that there is something beyond it to which it is subject, and which constitutes the personality of man. To concede otherwise is to believe that, in one instance at least, nature is inconsistent and untrue to itself, and in direct contravention with every other teaching. An idea, a conception arising in the mind, excited either from without or from within, becomes the stimulus of a new phase of thought. By a sense of the inefficiency of the working of some of life's machinery the mind is aroused, and the thought goes out into the region of the ideal—that unsubstantial region peopled with shadows, but which the magic wand of genius transforms into what we accept as living realities, and from which may be evolved a remedy for an existing evil.

In pursuit of this, the mind, the brain, thought—what you will—is forced to travel in obedience to the promptings of the complex, subtile essence *I*, through the paths of induction and deduction, separating and combining, weighing and comparing—in a word, thinking.



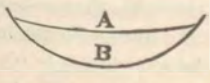
B. F. UNDERWOOD, M.D.

DISPERSION OF SILVER AND GOLD IN MANUFACTURE.—On the closing up of the Smith & Rogers extensive silver-plating concern in New Haven, preparatory to its removal to Meriden, the floor of the plating-room was taken up, burned, and the ashes analyzed, with the result of procuring pure silver to the amount of nine hundred and eighty-one dollars. This result is not so strange as appears at first sight. The precious metals are capable of extreme volatilization under heat, becoming mere vapors, which may be condensed, resulting in the production of the metal in a pure form. But, even without heat, the particles of gold and silver are made so exceedingly fine in the process of the manufacture of gold and silver goods, whether solid or plated, that no devices for saving the material abraded or thrown off in the various manipulations are entirely effectual. Even in the Government assay offices, the soot deposited in the chimneys from the melting of the crude metal is valuable; and in most manufactories of articles of gold and silver the proprietors do not allow their workmen to retain their work-clothes when worn out, but pay for them a price generally sufficient to procure new garments—an old tattered vest belonging to a bench workman sometimes being valued by the employers, even when in rags, at twenty dollars.



THE PSEUDO-MANIAC, OR CONSTITUTIONAL LIAR.

IT is now sixteen years since I first located a sign of the born liar on the upper eyelid. So far as I know, I had no prior teaching in the matter. Since then I have added four or five more points. I think I have now studied the case so fully as to warrant putting it into print. I turn to an old friend, the PHRENOLOGICAL JOURNAL, for help; and if I mistake in my claim of discovery, or in truth of statement, I ask for criticism and correction. A *flattering* school-mate was my first study! Since then many have been examined. No audience of a hundred lacks several, even though they be church assemblies—those most seen by me, for I am a "preacher of righteousness." I find physiognomy a help in my ministry, for "the bottom of every sin is a lie!" Or, as the "Autocrat of the Breakfast Table" says, "A lie is the handle that fits every sin." "All unrighteousness is sin," says St. John. There are six signs hung out by this "child of the devil." Three are of form; two are of complexion, and the other of action, or rather, inaction. That is, they are distinctively and severally such; for action, or expression, necessarily accompanies form and complexion.



First, then, of the three *forms*. A drooping or down-drawn upper eyelid: hanging as far down as the pupil. The normal eyelids are either the arcs of the same circle, or the upper eyelid is the arc of a smaller circle. In the pseudo-maniac, the upper eyelid violates this rule, and instead of being in this form—

it shows a greater arc—

or worse—

See *a* in each case. It further and chiefly presents the appearance of being drawn down at the outer end. This, of course, is the reverse of the Mongolian eye, that turns down at the inner end. Then, too, the eyelid beneath the eye-lash is often thickened and greasy. When this drooping lid is examined, deep, oily creases, extending lengthwise, frequently appear.

See the picture of Antiochus Epiphanes, called by the Greeks Antiochus Epimanes, or crazy, in Smith & Barnum's "Bible Dictionary." When I first saw his face, I said, "That's a constitutional liar;" and turning back, read, Daniel x. 21, "He shall gain the kingdom by *flatteries*." See also verses 21–27 of the same chapter, and "Newton on the Prophecies," pages 282–292, etc. Look at that eyelid. Look also at the evident struggle to "make the worse appear the better part." He elevates this eyebrow in order to lift up the curtaining lid, and so wrinkles the brow just at the curve of the brow back on the side face. This is the second form sign. It gives a weak expression to the forehead and eyebrow.

The third form is about the mouth. He smiles no higher than the wings of his nose. Around the mouth, stretching from the wings of the nose, are circular lines, often quite deep. This may be accompanied by an *uncertain* action of the lips.

As to *complexion*. On the cheeks, between a circle drawn from the wings of the nose to the outer corner of the eyes, is a faint bluishness. As you look the crazy one in the face, there is an evident shrinking, ineffectual look. It strikes you as a conscious hiding of falsity. This bluishness is not permanent. It also must not be confounded with the blue color caused by certain diseases—especially that of an Onan, or that caused by dissipation, or "watchings oft." The liar's hue covers more surface than these. It is of the cheek, not of the nose.

There is a second hint of complexion on the eyeball. The white of the eye appears of a pale dead blue, sometimes veined, and I believe the pupil is small, from which rays seem to cross into the iris. Of this radiation I am not very sure; but an observer

sees, if not the "cracked eye" of the insane, at least a hair-like radiation, with an oblique cast just there. This eye is never prominent; the sign on the eyelid being only over prominent eyes. There are thus two classes of eyes to be observed—prominent and sunken eyes. The covering is not so marked in the prominent, except in very vile cases, and the creasings are always marked in them.

The sign of action. These people seldom or never shake hands. They will surrender the hand to you, and you can exhaust and disgust yourself with the soft thing. They are engaged elsewhere; mostly, I judge, in struggling with their consciences, or devising some story of imagination or plan of malice. It is to be remembered that not every person has all the signs mentioned. Some have only the drooping eyelid, which, by the by, I saw noticed in the PHRENOLOGICAL of February, 1872—an old copy that came into my hands last November. A lady is there mentioned as refusing to allow a servant to be hired who had it, as one evil mark. She did not name her sign. This drooping, drawn lid is most frequent.

The action of these diseased minds—for whole families are born that way, and I have sometimes thought one act of pre-natal deception might mark the babe—differs with their general structure and disposition. Imaginative ones will magnify and color all things in a harmless way, like the young presbyter's "barrels of tears." Gay and lively ones will tease and joke in falsehood. Others will flatter, both from complaisance, in weakness (wanting determination of character), or with a purpose to defraud others and build up themselves.

It is my desire that this sad truth should breed charity; so again I say, do not confound the signs described with certain signs of physical disease, or with the "intellectual eye" that peeps, nor with what the "New Physiognomy" calls the "penitential eye," where the upper eyelid is represented as falling as low down as the pupil. I never saw such a case.

A seventh sign might be added, but I only suggest it. The pseudo-maniac has often, if not always, a soft, *creeping* voice—at least, false women have. Cardinal de Mazarin and Anne of Austria, as usually pictured, show themselves to be constitutional liars. She has the eyelid and he the cheek. See the cave-like projection of her eyelid, and his hanging, struggling lids, with vacant look below them. No wonder it was hard to tell Mazarin's progenitor. I will wager that he told his birth to suit his audience. No wonder he lacked mighty Richelieu's *strength!* Anne's form and her liar sign put to rest the question of her unchastity.

ALEX. M. DARLEY.

Del Norte, Colorado.

RECOLLECTIONS OF A PRACTICAL PHRENOLOGIST.

No. I.

IF all the queer and interesting facts which occurred in the experience of the writer in his application of phrenology, during the last thirty-five years, could be recorded, they would furnish to the reader a fund of interest and amusement, if not instruction. Of course the practical phrenologist never finds out one-tenth of the interesting points which he makes, or the sharp hits which his science enables him to give. They are not brought to his knowledge historically. The present object is to recall and record a few of such incidents as may be thought worthy the reader's attention.

In 1839 I was making an examination for a young man in Pennsylvania. He was of German stock, had a round, low head, and was very strong in his propensities and passions. An elderly man came in and sat in a distant part of the room, as if waiting for his turn to be examined. Noticing that the young man bore special resemblance to the masculine side of the house, and did not resemble the mother's, I remarked: "You take after your father." "Yes," responded the elderly man; "he took after me with a club last week."

I did not explain the purpose of my re-

mark, but descanted on the enormity of his conduct, hoping it would be of service to him.

During the same year, at the close of a lecture in New Jersey, a man was brought forward for public examination by a committee appointed to make such selections. Running my hands over his head I discovered that he was a most dangerous character, and liable to manifest his anger in a fierce and ungovernable manner. There seemed to be a great interest in what I was expected to say, for five or six of the more influential and important men of the audience left their seats and came up to the platform, sitting on the steps and standing about. My first remark was: "I will esteem it a favor if the audience will permit me to dismiss this subject, and will introduce some other person, for I dare not express just what I think of him." This was accepted by unanimous consent. Especially was it approved by the gentlemen who had gathered around the platform. I afterward learned that the man had just completed a term in the State's prison for manslaughter, and that he was considered a very dangerous man, and these gentlemen had come around the platform to protect me in case of necessity, as they had no doubt the man would rise against me if I told him the truth.

COLOR SMALL.

A man was described as having Color very deficient. The carpet of the room where he was sitting was distinguished for its very bright and bold colors. Pointing with his foot to a patch of most brilliant scarlet the examiner asked the subject what the color was; and he turned his head from side to side, and studied the carpet, and replied: "Well, that I judge to be a kind of brownish, reddish, greenish color."

Another man was described in public as idiotic in Color, and he stated to the audience that he was a sportsman, and thought he could recognize a bird as far in the air as any of his acquaintances, and know by its form and motion what the bird was, showing that his eye-sight was clear, sharp, and strong; but he could not tell green from red. All colors to him, he said, had a lightness and a darkness, according to the amount of coloring matter they had in them, just as crayon or india ink work presents lightness or darkness according to the amount of coloring matter that is applied. So that red did not seem red to him; blue was dark, brown was dark. Each was simply removed a certain degree from whiteness. And it is well known that the camera represents in the photographic picture, red as black, and blue shows very light. Let a lady have a dress trimmed with red and blue, and the red will come out black in the picture, while the blue will come out nearly white, showing that the camera recognizes colors only in the nature of lightness and darkness.

Two brothers were examined in Whately, Mass., in 1842—Dr. Harwood and Colonel Harwood. The organ of Color was small, and was so described, and the gentlemen stated that they could not distinguish at half a dozen yards distant the ripe cherry from the green leaf which might hang behind it. Red and green, in short, looked the same to them.

KLEPTOMANIA.

The same year I was invited to a jail in Massachusetts by a young lawyer, who has since become United States Senator, to examine the head of a client of his, whom he was to defend on the charge of stealing. No information was given as to his alleged crime, and we described the young man as being abnormally acquisitive, or selfish in respect to possession; that he had very strong Veneration, and would manifest much religious devotion, and would be sincere in it; while with his small Cautiousness and Conscientiousness and very large Acquisitiveness he would be likely to trespass upon the rights of others in the way of stealing.

At this point the lawyer told the young man he might tell me what he had told him (the lawyer). He went on to relate that he had been in the habit of stealing everything, whether he wanted it or not; that he would go to prayer-meeting and take the opportunity of praying two or three times during the evening, and sometimes on the way home he would be inspired with a devotion-

al feeling and would kneel down in the corner of the fence alone, and have a season of prayer that was sweet and heavenly to him; and, as strange as it may seem, if he saw a hoe hanging on a farmer's fence, or a whiffle-tree chain, or pin of a cart neap, or a beetle and wedges, or an old axe half worn, he would steal it, and afterward it would occur to him that he could not use the articles, nobody would buy them, and his only way was to conceal them; and he remarked that there was a hollow log lying in a small piece of wood in which he had secreted the articles which he had stolen, because he dare not carry them home, nor offer them for sale. But it seemed to him that he could not help stealing them; the impulse came on, and though he was sincere in his religious devotions, and exceedingly happy in their performance, he seemed to himself to be left to the temptation of the devil when anything which might be stolen was left in his way.

A man called for an examination who was a minister, and at the close of a long and sharp analysis of his character, in which Acquisitiveness and Secretiveness had been described as strongly developed and very active, and also Conscientiousness and Cautiousness had been estimated as large, he seemed unwilling to go, but walked up and down the room for several minutes as if he had some burdensome question he wanted to ask and yet was afraid to ask. Turning to him I said: "Do you wish to ask any questions?" "Yes," he said, "there is one thing about me which you do not seem to have described. If you will tell me *that*, I will believe in phrenology." I instantly replied: "You have an inclination to steal, but probably manage to refrain from it." He opened his eyes with terrified astonishment, and giving me such a fierce gaze as will never be forgotten, remarked: "Sir, that is true. That is my trouble. I am a clergyman, sir, and hope I am a true one; yet I have all my life long been tempted to steal, and in my parochial visits, often have an impulse come over me to take something; and if left alone in a room I do take it; and sometimes it requires half an hour to find a convenient opportunity to get the article thus taken out of my pocket and back upon the shelf or table where it belongs. It may be a shell which every Sunday-school child in the parish knows; it may be an old hymn-book with a name written in it, and half worn out—things which I do not need, and could not use, if I did need them, without the theft being detected." And he remarked with tears tumbling down his face: "By the help of God I have been able, hitherto, to refrain from carrying away anything which I had thus, under the impulse, stolen."

Twenty-five years ago there was a well-to-do farmer's wife in Connecticut who had an impulse to steal only one kind of article, and that was blue stockings. If she were driving in the middle of a bright afternoon a mile from home, where she and the horse and wagon were well-known, and she caught sight of a pair of blue stockings hanging on a line in the yard with other clothing, she would stop her team, get out of the wagon, go into the yard right in front of the rooms where the family were working, and jerk those stockings off the line, leaving a dozen pairs of other colors, return to her wagon, whip up the team, and get out of the way. If she had been a stranger whose peculiarity was unknown she would have been followed and arrested and punished; but everybody knew that she had that queer monomania for blue stockings.

I examined a man's head and described him as being very fond of money, happening, of course, to use that term *money* instead of property, and it made quite a sensation because it was known that he would steal money, and he did not hesitate to talk about it himself. But he would steal nothing else, no matter how valuable, though he knew he might be detected.

There are numerous occasions for amusement to the practical phrenologist in consequence of people misunderstanding what he intends to express. As a companion piece to the young man "who took after his father," another case occurred in the same State. When a man has large Alimentiveness he is sometimes said to be very fond of a good dinner. I overheard a man talking about the wonderful accuracy of the examination which I had made of him; and one

thing, he said, he could not quite understand, and that was that I said he was very fond of a good dinner. Now, he remarked: "I am, as everybody knows, very fond of a good dinner, but I do not care much for my breakfast or supper." The truth is, he drank habitually, and used to go to bed mellow every night, and when he awoke in the morning he had no appetite for breakfast. He would take a drink of whisky, perhaps a cup of coffee and a bit of toast, and by dinner-time, say one o'clock, by constantly keeping his boiler warm with whisky, he would be ravenously hungry, and eat excessively, and that would last for the rest of the day; and going to bed again full, he would rise in the morning without much appetite, and not regain it until dinner-time came.

NELSON SIZER.

THE RUSSO-TURKISH WAR.

THE CZAR—THE SULTAN—THE COMMANDERS.

THE Russians are now south of the Danube, yet the conflict has as yet developed little of definite advantage to either side, although the opinion of eminent military men, who from their posts of observation in France, England, and Germany can survey the field with some degree of satisfaction, is altogether favorable to the success of Russia. This we would expect, after all that has been said about the "sick man" during the past twenty years. But Turkey has shown a remarkably pertinacious spirit from the outset, and the declaration that she regards the war as a

ALEXANDER II. OF RUSSIA.

contest of creeds, indicates that she deems her strength unequal to Russia, and her cause one which demands desperate measures.

Russia being the attacking party, and having many difficulties to meet in the march of her armies southward, not only difficulties arising from the topography of the country on both sides of the Black Sea, and from the necessity of investing frontier fortresses which the Turks have hurriedly strengthened, but also from the political

Abdul Hamid, Sultan of Turkey.

complications which her entrance upon the soil of foreign principalities gives occasion to, needs the moral and physical support of a greatly superior armament to advance victoriously. Besides, Servian, Armenian, Roumanian, must be placated, and in such a manner that the watchful great powers will not complain of her needless injustice to the little States lying in her paths to Constantinople. Our portraits furnish views of the representative men on each side.

ALEXANDER II. OF RUSSIA.

The Czar (pronounced tsar) is a man of fine presence, tall and well-proportioned. His head and face, according to *Le Monde Illustré*, which furnishes our portrait, evince characteristics which attract the observer, and embrace few elements of that despotic and unscrupulous sovereignty with which we have been accustomed to invest Russian emperors. Born in 1818, he did not inherit from the imperious, stern, and cruel Nicholas much of his nature, but more of his mother's gentleness and nervous susceptibility. Then, too, his German education fed his disposition to quiet reflection and the retired enjoyments of friendship and domesticity. We are told that he has few of the qualities of the leader, but is the Czar on compulsion, and, singularly for a Russian, averse to military show and customs. His head has not that width apparently which is essential

to the soldierly spirit, but is rather high and well filled out in the anterior region, giving him character for kindness, good-will, and the desire to deal fairly with others.

THE SULTAN OF TURKEY.

Abdul-Hamid II., the third Sultan to whom the "Faithful" have been required to offer their homage within a year, succeeded his brother Murad V., who was deposed after his few months' reign, on account of mental incapacity, and who subsequently committed suicide. Abdul-Hamid was born in 1842. His mother died while yet young, and he was adopted by a lady of Abdul-Medjid's (his father) harem, who made him heir to considerable wealth. Like his brother Murad, Abdul-Hamid led a very jovial life during his father's lifetime, but his stronger constitution enabled him to withstand the excesses which rendered his brother partly imbecile.

When Abdul-Aziz made the tour of Europe a few years ago, he accompanied him, and contracted a taste for French clothes and French customs, many of which he has introduced to his own household. He is exceedingly fond of maps—military, geographical, and statistical—the study of which is his favorite pastime. He refused to mount the throne until his brother's state was pronounced incurable, and, as a member of the Old Turkey Party, he advocated war to the death rather than any compromise which should bring about the disintegration of the empire. According to the London *Daily Telegraph*, he is thin and sinewy-looking, with bright, dark eyes, and a quick, flashing glance; is the husband of only one wife, living until lately at a small palace at Kiahat Hane with his two children "quite contentedly, *á la Francaise*, eating at the same table, and playing with the little ones like a model pater-familias." Nevertheless the Sultan is a stanch member of the orthodox Old Turkey Party, and is very punctilious in his religious observances, though rumor says he is not so strict a Mussulman as he professes to be.

GRAND DUKE NICHOLAS, OF RUSSIA.

His portrait does not show much energy, but, if anything, a disposition to personal ease and social entertainment. We are told that he dines shortly after sunset, takes no raki before his dinner, and no wine with the meal (herein showing a spirit of reform upon his early life). Once or twice a week he invites some members of the Cabinet to spend the evening with him, and talks to them upon

public affairs; other evenings are devoted to music. He has a special pianist, an Italian, attached to the palace, and sometimes the Palace troupe perform a pantomime for his amusement. He is personally averse to carriage or horseback riding, and it is seldom that he travels in such manner.

THE GRAND DUKE NICHOLAS.

Nicolawitch, second brother to the Czar, the Commander-in-Chief of the Russian Army, was born August 8th (July 27th, O.S.), 1831. He is Aide-de-Camp-General to the Czar, and Inspector-General of Engineers; Commander of the Imperial Bodyguard, etc. He married, February 6th, 1856, the Grand Duchess Alexandra Petrowna, daughter of Pierre, Prince of Oldenburg, by whom he has two sons, the Grand Duke Nicholas and Pierre. The Commander-in-Chief is a tall, handsome, athletic soldier, exceedingly popular in the army, having proved himself possessed of a high degree of courage, tact, and endurance.

Immediately upon the recent mobilization of the forces, he was transferred from the command of the troops around St. Petersburg to that of the Southern Army, now in the field. He is regarded as a type of the rough, vigorous, and warlike Russian of tradition. His culture is not high, but he is ambitious for distinction, and had much to do with bringing about the present conflict.

ABDUL-KERIM PASHA.

A stout-looking old war horse is this follower of the Prophet. Although too far advanced in life for active service in the field, he was deemed fit for the important position he holds in the army. He was appointed Minister of War by the Sultan immediately after the assassination of the Ministers of War and Foreign Affairs by the Circassian Hassan, on the 15th of June, 1876, and on the 9th of July following he assumed command of the Turkish troops operating in Servia, while Mukhtar Pasha took charge of those in Herzegovina. He is stout, heavy, and lame, but pleasant in manner, although inclined to be taciturn. His merits as a soldier are not considered by experienced judges, out of Turkey, as deserving of the important place he holds at the head of the Turkish arms, but he has enough of the strong and basilar elements of character to feel very much

ABDUL KERIM PASHA.

at home in prosecuting warlike enterprises.

THE TWO ARMIES.

A comparative estimate of the military strength of Turkey and of Russia gives the latter a great superiority. The Turkish army is made up of three classes—the Active, Reserve, and Sedentary—the first comprising upward of 200,000 men; the second, nearly the same number, and third, 300,000, in all 700,000. The regular army of Russia in time of war, according to recent statistics, is constituted thus:

	Officers.	Men.	Total.
Active service	21,557	845,483	867,040
Reserves	3,522	171,788	175,320
Dépôts	6,605	273,182	279,787
Local troops	12,773	350,866	363,639
Totals	44,457	1,641,319	1,685,786

Besides these, are the irregulars, of whom the Cossacks are the most important auxiliaries, in themselves numbering over 125,000. Their operations are chiefly conducted on horseback, being, as riders, renowned throughout Europe for their courage and adroitness. If the losses of the Turkish armies in the contest with little Montenegro be as great as has been stated, viz., upward of 26,000 killed during the contest of the summer and fall of 1876, the Montenegrin loss being but 1,000, how can the successor of Osman and Sulieman hope to cope with the power of Russia? Yet some observers predict a long struggle. Turkey fighting for her faith and for existence, will exert all her strength, bring to bear as far as she may all her resources, and be somewhat encouraged by the history of her past conflicts with the Sclave, to expect aid from one of her old Christian allies.

GROUNDWORK OF HEALTH.

USING the terms in a general sense—that person is more amenable to the law of ethics who has obeyed the law of hygiene. Taking this proposition as substantially correct, what follows? Necessarily that a healthy people will also be moral. This is a conclusion arrived at, not without many doubts and misgivings. The saying, that what we would like to believe is apt to influence our beliefs, is undoubtedly a true one. But what we want is facts—especially if those facts can serve the happiness and well-being of society.

Sociology is a good study, and we like to dwell upon it, as we like to look at any work of art—from the esthetic point of view. Ugliness may be united with health, but is oftener united with disease. The grand harmonies of nature, as they are unfolded, teach this. Civilization claims to be the best exponent of this unfoldment; but according to the evolutions of history, civilization, as at present interpreted, is slavery. There can be no desirable statute of intelligence so long as this interpretation is well grounded, and we have no reason to doubt the verdict. The rule-or-ruin portion of civilization is predominant yet, notwithstanding that it is nominally vanquished. You are counseled to tread lightly when walking over a smouldering volcano; we have the hardihood to disregard the caution. The money power is the power of slavery; and until sociologists can bring themselves to consent to this diagnosis, the patient will suffer. Self-knowledge, if thorough, is admitted to be universal knowledge, in its broad sense. The best wing of the money power is prepared to accept this definition, and is acting upon it. So the harmonies are in the ascendant. Weak-kneed people, of course, will say, "Trouble is ahead," but we do not believe it. Our all is staked on our judgment, and we have as much at stake as any one. This will account for the course we are pursuing in this matter of health.

Health is happiness, and, knowing this fact, we long since devoted our life and all we possessed to search for the key that would develop the talisman, the philosopher's stone of hygiene. Our success has been commensurate with the time and patience bestowed upon the subject, and in these little papers we aim to give the world the benefit of our thought and experience.

Los Angeles. F. M. S.

HOW TO TEACH.*

FACULTY OF ORDER.

ORDER is said by the poet to be "Heaven's first law." If we look around us, we see that everything in creation is adjusted according to system. By observing its method, we learn to adapt ourselves to the affairs of the world. We study its arrangements, and know what to depend upon. To a child the blossoms of spring are a surprise, and the fruits of the summer and autumn are an equal surprise; the early frost and the fallen snow make him wonder, because he is not accustomed to them, has not expected them. After awhile, when he has learned something of the order of nature, he hopes the cold winter will be past and the balmy spring return, and the summer flowers, and singing of birds, and the happy autumn with its harvests. He gets used to the order of creation and Providence and looks for its changes. Those in whom Order is most developed adapt themselves most kindly to the order of things. They learn them quickest, expect them most pleasurably, and relate themselves to all the changes of life. Those in whom the faculty is deficient are always running their heads against the ways of Providence and the order of life.

We learn through the action of this faculty to look for all things in their season, and for everything according to the method of creation. Hence, we never look for corn in the ground, or potatoes on corn-stalks, or for corn to grow on trees. We never expect to "gather grapes from thorns or figs from thistles." When the silly hen has been cheated to sit on ducks' eggs, and patiently hopes to see them develop into the image of herself, she is terrified beyond measure when she sees her duckling chicks rush into the water for the first time. They have violated her idea of order. But when a duck has been deluded into hatching hens' eggs, she is amazed to see the little chicks refuse to follow her into the water. We do not know how much philosophy the hen may exercise in trying to study the physiognomy of her newly-hatched chicks—why they should have such broad faces, and such amplitude of bill, such breadth of foot, and such a wallowing gait; and though she does not stop to criticise nice distinctions in regard to hereditary transmission of form and quality, she knows the difference when they plunge into the water, where she herself dare not go.

ADAPTATION TO RULE OR SYSTEM.

In our disposition of affairs, we seek to have a place for things and things in their places. Cattle on a farm select a given place to lie down at night. Birds want a particular perch, and they are restless and discontented if another takes their place. One aspect of Order gives uniform methods of doing things, and a systematic, particular place for things. Another aspect has to do with the best rule for doing things. Many have the first kind of Order, a particular way of doing and a particular place for things; but they do not always have the best way nor the best place. Persons may be orderly and not tidy; others may be very tidy and cleanly, but not methodical. But when we see a woman who has a place for each plate and dish in her closets, we expect she

* From "How to Teach, according to Temperament and Mental Development; or, Phrenology in the School-Room and the Family." By Nelson Sizer, S. R. Wells & Co., New York, Publishers. Price, by mail, $00.00.

will see to it that they are clean and bright; though we have seen systematic and regular places for things when the articles were not tidy and cleanly. Some mechanics have everything mixed up and confused; they have finished and unfinished work together, and their tools are all mixed and confounded. Some men have their bench full of tools; they find with difficulty that which they wish to use, and are vexed because everything seems to be in confusion. Another will have a rack in which all his tools are kept, and when any tool is used it is instantly returned to its proper place. He neither loses time nor patience in hunting for his tools, nor are they injured by rough contact with other things. A housekeeper that can tell where to find any particular thing she wants, in any drawer, and in what part of the drawer it may be found, evinces this faculty.

ORDER CAN BE CULTIVATED IN SCHOOLS.

There is no place of human meeting and human work where disorder is more likely to be seen, or where order is more needful, than in the school. If the teacher have large Order, Ideality, Firmness, Self-esteem, energy, and patience, the school is a good field for their exercise, and their influence will show in great distinctness when perfect order is maintained. We do not mean a frigid silence, or a stupid fixedness; but when all motions are made in harmony, and every change is made with the graceful precision of military evolution; the movements in the dance, the gymnasium, or a well-ordered workshop, like the "music of the spheres," there is realized the ideal of Order. The utility and the necessity of order are sometimes eminently illustrated.

Suppose a hundred boys were dismissed at the word, each being in a hurry to get out of the room, what crowding and confusion will there be, requiring much more time to clear a room than if the school were dismissed class by class, and let them march out like soldiers. And how much more graceful and elegant is the orderly process. Sometimes when a school-house takes fire in a city, and there are, perhaps, 1,200 pupils in the building, some wise person from down-stairs comes up and quietly whispers the fact in the ear of the teacher, who then, with self-possession, and without exciting alarm, announces that there will be a recess for five minutes, and class No. 1 may retire, and Nos. 2 and 3 follow. They never need an excuse for going out, and by the time they are on the street they begin to wonder what the recess is for, and find out that the school-house is on fire. Otherwise, they would have been frightened, and rushed to get out of the room, upon the staircase tumbling over each other and over the banisters amid the wildest confusion, and, perhaps, a dozen of them would be trampled to death. If in churches, people would file out of the slips or pews next the door in order, and walk briskly out, the edifice would be cleared in one-tenth part of the time that it now takes, when all crowd into the aisles and everybody is in somebody's way.

Nature having established the law of order, we could not break it if we would, and if it were in our power we could not do it without serious damage to our interests.

HOME CULTURE OF ORDER.

This faculty should be cultivated in children at home. Let the three-year-old child have something to do; let him have a place for his playthings, and be taught to recognize this law of order. If a child could throw down his play-

things at pleasure, and have them picked up by nurse or servant, that child will become selfish as well as slovenly. But if it be required to put its things in the box or basket, or hang them up when not in use, and put away clothing and other articles, this faculty will become active and influential in the character, greatly to the comfort and convenience of all. The sloven is hindered, fretted, and annoyed by his own want of arrangement, though sometimes the desire for order on the part of others may annoy them and induce them to fret and scold. The pleasure experienced from order and neatness, and the pleasure and comfort the family derives from having everything nice in the house, will counterbalance, probably, all the fret and worry an orderly person may feel called upon to exercise. Slack-twisted and disorderly people have more worry in an hour in hunting for things they have mislaid, and in being vexed at people who "carry them off," than is the case with sharp, orderly people who are always trying to keep everything neat and tidy. Commend us, then, to a housekeeper that is tidy and orderly; who may grumble if people come into the house with muddy boots. Such persons will have mats and scrapers for the purpose of removing the dirt from the shoes before it shall be brought into the house, so that those coming in who are inclined to be tidy will find the means at hand for the purpose. Those who are tidy in housekeeping, and in keeping everything in its place, will make home at least worthy to be the abode of happy people. A kindly and good example will teach the family order. It is not enough to preach against disorder, or against persons for permitting or producing it. Orderly people are apt to scold those who are disorderly; but this is not always the best way to reform the slovenly. We once saw a man put his dirty boots on the velvet cushion of a car-seat. It was a new, bright car, and the conductor felt proud of it. He came along, and, asking permission, put a silk handkerchief over the seat, and told the man if he wished he might put his boots on that; but neither he nor anybody else in that car again, during that trip, tried the experiment of using a velvet cushion as a foot-stool, and the delinquent himself was not made angry. If the forty people in the car remembered it with as much vividness as the person probably does at whose expense it was made, it, doubtless, has saved many a car-cushion from that day to this.

MOVING OTHER PEOPLE'S THINGS.

Hotels and boarding-houses bear many marks of the reckless disregard of Order, as well as of the rights, interest, and comfort of others. The scraping of matches on handsome white walls, or those neatly painted or papered; the careless leaning back in chairs against walls or furniture, badly marring both; the putting of feet on chair-rounds, window-stools, fenders, or mantels, may be mentioned as marks of disorder, injustice, and ill-breeding.

It is said that "cleanliness is next to godliness." It is certainly a Christian grace to be cleanly and orderly. Those who complain of the rattle-bang boys who go slamming about and leaving everything in disorder, should early train the faculty of Order in their children; and they may, perhaps, regard it as a censure upon themselves if their children are not orderly. We once knew a farmer who, when he hired a man for the summer, if he found that the axe had not been left in the proper place in the wood-shed, but left at the chopping-block, where the new man had worked with it, he would wait till his man had gone to bed, when he would rap at the

door and call his name, and request him to dress himself and come down; and he would then ask for the axe, and when it was shown him, he would say: "I looked in the proper place, but did not find it. Will you please hereafter to put it there?" It was done good-naturedly; but that young man never forgot to leave the axe in the right place, nor anything else on the farm, while he stayed there.

NUMBER, OR CALCULATION.

The faculty of Number is necessary in the mental constitution. It enables us to perceive two, as distinguished from three, or any other number. It not only enables us to distinguish between the concrete idea of number applied to material objects, and the abstract idea of number *per se*. Individuality enables us to make a distinction between one thing and another thing, but it does not count the number of them. It might give us the idea of many, as we have when we look at a load of sand containing particles numberless; thus we measure sand by the bushel, by the load, by the quart, as we do grain. We count sheep, cattle, horses, and buy and sell them by number as we do eggs by the dozen. But beans, peas, and corn we cease to enumerate, and sell by measure; so many measures for so much money.

The faculty of Number seems to be manifested in some of the lower animals who are usually most intelligent. Crows have been known to recognize numbers as high as five or six. Other birds, less sagacious, may only know as far as two or three. If ten men enter caverns or ruins which birds inhabit, they all fly away from their nests and perch near by; if three men go out they all eagerly fly back. Their idea of number has been exhausted on three, and they seem amazed to find that some men are left and again retreat. Three more men going out, the birds rush back again, showing that three is the extent of their idea of number. Cats, when deprived of half a large litter, do not seem to appreciate the difference in number; but if five are taken away and one only left, the cat has an idea of the difference between one and six, and she will hunt to find that which is lost.

In ascending to the human species, we find that some negro tribes can count only to five and use no compound terms. They say five-one for six, five-two for seven. Others make shift by saying both "hands" for ten; both "hands" and one "foot" for fifteen; "hands and feet" for twenty. All above this is "many," or innumerable. The Esquimaux Indians have no idea of number above five, everything else is "many." The arrangement of our mathematics, while logical, as we all admit, is, when carefully examined by the light of Phrenology, apparently dependent upon the addition of one or more of the other faculties to assist the organ of Number. If mathematics be the doctrine of quantity, certainly Size and Weight must be brought into use, and in geometry and trigonometry Form and Locality as well as Size and Weight must be included. For example, we start with simple counting, using in the kindergarten blocks, beads, balls, and building-blocks; this is pure number; the why and wherefore, or the reason that two and two are not six. Then we have notation—translating the words into figures; here the perceptives come in, the immediate neighbors of the organ of Number; Individuality, to recognize the figures, and Form, to distinguish them by their shape. Numeration is justly linked with notation, as it is the converse—translating the figures into spoken or written words. Locality is also an accessory, especially in pointing

off periods, as hundreds, thousands, etc., and carrying these localities in the mind. With the succeeding rules we have the study advanced. Addition is properly placed first, as it is the easier, since it requires less mental effort to consider two quantities side by side and perceive their sum than to subtract one quantity from another, and perceive at the same time the original quantity, the quantity to be subtracted, and the result. In this process the reasoning faculties, Causality and Comparison, begin to act.

One step further is multiplication; here we have the multiplicand, multiplier and product, more complex than addition. The setting down of one figure and carrying the other to the next order of figures, or the setting down of a number of partial products, each in its own proper column, then the careful addition to give the complete product. All these complicated operations require the simultaneous carrying of several ideas, and involve a compound mental action.

The same is true of division, more complicated, perhaps. The studying of fractions, common and decimal, is still more complicated, as all teachers know.

They can easily carry out our idea for themselves. In the rule of three, and proportion generally, we have a distinct logical statement, viz.: as A is to B so is C to D, and, therefore, B C is equal to A D. Here we begin to see the utility of mathematics as a discipline for the mind. The study of square and cube root, taught, as they often are, by diagrams and dissected blocks, brings into play Form, Size, Individuality, Comparison, and Causality, as well as Number. All teachers will testify as to the difficulty of teaching these subjects successfully to the average pupil. In mensuration, weights and measures, and "concrete arithmetic" generally, if we may use the term, all the organs above named are occupied, and, at times, others. But it is in the higher branches that the aid of many faculties is demanded by Number. In algebra, for instance, application is made of principles demonstrated beforehand which must be held in the memory; again, the mind must be trained to appreciate instantly the time when the previous demonstrated principle is applicable to the problem in hand, so that the pupil need not work out the tedious problem every time to apply his knowledge in advancing him to new standpoints as he goes along. These statements, true of algebra *par excellence*, are equally true of those higher branches —impossible without algebra, as we know—the Trigonometries and the Calculi, together with applied mathematics generally. We are now able to perceive why mathematics disciplines the mind. Commencing, as we have seen, with a single faculty, the proper use of the science compels the brain of the scholar to use one faculty after another, until, as a climax, we find the perceptive and reasoning organs active and under control, which is the true object of education, to give the pupil a healthy, active, manageable brain.

Those wonderful calculators who have astonished the world, such as Zera Colburn, are generally not mathematicians, as he was not, though he had culture in that direction, and it was expected he would astonish the world; but as the higher organs of the intellect which comprehend philosophy and the relation of subjects were wanting, he failed. There are geniuses in language, poetry, memory, mechanics, who are born with a peculiar facility and power of manifestation, and those who can multiply mentally and work out arithmetical

problems faster than the best arithmetician can do it in the ordinary way on the slate, must be regarded as possessing an exaltation, or genius, in respect to figures, and they are exceptions, as other geniuses are.

Much of the business of life is intimately related to the faculties which aid us to enter into the science of numbers and mathematics.

A mathematical cast of mind requires that the person should follow something in which the exact and the mathematical can be made serviceable. We often meet with pointed illustrations of this. A man brought his son to our office for examination. They looked sad, discouraged, and gloomy. When the young man took his seat the father spoke in a sour sort of way, saying that he wished to know what that boy could do to earn his daily bread. After a careful examination, we replied that he could do anything, unless it was something like wood-engraving. They cast a quizzical look upon each other, when the father inquired why he could not successfully follow wood-engraving, we replied that he had so much Order and Calculation that he would want to fix a machine, or establish a rule, or use gauges to space off his work, and do it as by machinery. The father informed us that he had then just taken the boy away from a wood-engraver who had been trying for six months to teach him his business, who complained that the boy wanted to use gauges and rules, and was not willing to work by the eye. We advised the father to let the boy go at architectural drawing, or carpentry, where he would be required to work by mathematical rule, and employ mechanical ingenuity and artistic taste at the same time.

The organ is located back of the external angle of the eye, and when large, gives fullness and squareness to that part of the head.

SEEKING A SITUATION.

When seeking a situation do not propose to take an advanced post. Ask for a chance to *work*, beginning at the bottom. You may be considered qualified for something better, yet be placed at the foot to test your temper and fidelity—to ascertain if you will be "faithful over a few things," as a qualification to become "a ruler over many things." If you sweep, make fires, dust, do anything and everything promptly and cheerfully, you will be advanced so fast as you are seen to have mastered your allotted position. Grumbling at your lot, and asking to be put forward, will disgust your superiors, who are perhaps planning to obtain some one to fill your place that you may be put forward. Men like to manage their own business—dislike to have boys make suggestions as to their own occupation or pay. Plants are not put in large pots until, by healthy growing, they seem to have filled the small ones. If a puny plant were to tease the gardener for a large pot, or open-air planting, he would wisely say, "Fill the place you occupy first, and thus show your adaptation to a larger one;" or, in disgust, he would jerk out the feeble starveling and put a vigorous successor in its place. Many a boy has lost his situation because he whined for a post of duty beyond his present capacity to fill.

He who, in store or shop, begins at the bottom and learns how to do everything, and is competent to every duty, has his position and ultimate success in his own keeping; and he will be sought after by many, if it is known he is at liberty to accept of a new engagement. We have seen a faithful boy take a selfish man's place in a shop or store, having, of course, increased responsibilities, a more elevated position, and better pay than before.—*From "Choice of Pursuits."*

SELF-KNOWLEDGE THE FOUNDATION OF EDUCATION.

ACCORDING to the popular idea, education means the acquisition of book-knowledge, such as is taught in our schools and other institutions of learning. When our young men come home from college, where they have been drilled for several years in Greek, Latin, mathematics, and metaphysics, we say they are "liberally educated." And when our young ladies graduate from boarding-school well-disciplined in French, Italian, music, painting, drawing, etc., we call them "highly accomplished"—these terms, "liberally educated" and "highly accomplished," expressing the popular idea of education. But, to my mind, education embraces a far wider sphere than the mere acquisition of book-knowledge. The mind is not simply a *tabula rasa*, upon which may be inscribed any curious knowledge. Neither is it a store-house, in which we may store up the learning of the schools, as one would shovel grain into a granary. On the contrary, the mind is an active as well as a passive agent; and education consists, not only in storing it with useful knowledge, but also in developing its inherent capabilities. As the etymology of the word implies, it is a drawing out—a developing of what is in the man. It is not confined to the intellectual part of his nature alone, but embraces the moral sentiments, the animal propensities, the social feelings, and even embraces the development and proper care of the bodily constitution.

This view corresponds with the definition of education given by Dr. Caldwell:

"By education, in the abstract," says he, "I mean a scheme of action or training by which any form of living matter may be improved, and, by perseverance, raised to the highest perfection of which it is susceptible."

With this all-embracing definition before us, we may be able to appreciate the importance of a thorough knowledge of the human constitution in a correct scheme of education. The human body is composed of a number of organs and systems, each of which has its peculiar function, and is regulated by definite laws. Now, in order to raise our bodies to the highest perfection of which they are susceptible, it must be evident that a thorough knowledge of the various parts of which they are composed, of the laws which govern their development, and the causes which impede it, is of the very first importance.

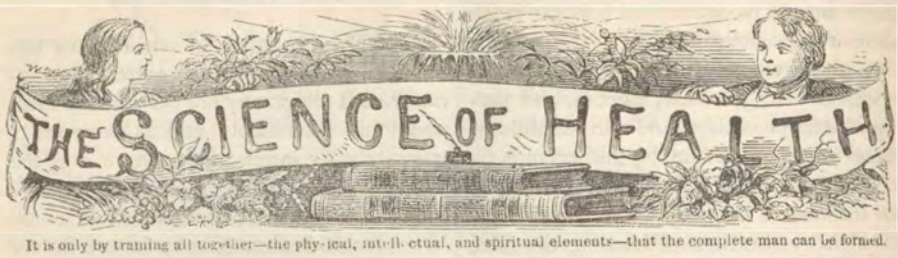
Without this knowledge, we are as ill-adapted to develop our bodies successfully as a landsman would be to manage a ship. Before a sailor can make a successful captain, he must have become familiar with every part of the ship and every duty required of her crew. He must have studied the science of navigation; be able to take his bearing from the stars; be familiar with the dangers which lie in his course and along the shores which he intends to visit; know how to take advantage of every favoring breeze; and be able to foresee the storms while they are yet brewing in the heavens. The more he knows of all that pertains to his calling, and the more assiduously he attends to his duties, the more successfully will he manage his ship, and the greater will be the assurance of those who intrust their lives to his care that they will sail in safety.

Now the human body is a machine a thousand-fold more complicated than a ship; it is surrounded by dangers a thousand times more numerous; and it is just as unreasonable to expect to preserve it in health, and rear it to the highest perfection of which it is susceptible without a knowledge of its parts and the laws which regulate their activity, as it would be to place a man on board a ship and expect him to navigate the great ocean in safety, without any knowledge of the mechanism of the ship, the laws of navigation, or any chart to guide him amid the dangers of the deep.

Yet, if we look at the instruction usually given in our schools, and even in our higher institutions of learning, we will find it very deficient in this primal element of education. Reading, writing, arithmetic, and geography constitute the ordinary stock in trade of the district school, and, for men in humble life, it is supposed that a passable

knowledge of these subjects is sufficient to enable them to navigate their barks over the ocean of life successfully.

To those who are able to pursue their studies farther, grammar, algebra, and perhaps a little physiology and natural philosophy are added; while among the accomplishments are reckoned music, drawing, painting, and the modern languages. In our colleges and higher institutions of learning the chief prominence is given to Greek, Latin, metaphysics, and the higher mathematics. It is true that some attention is given to physiology, but it does not extend much beyond the mere learning of the parts of the human body, the number and names of the bones and muscles, and the functions of its various organs.



Thorough practical training in the harmonious development of all its functions, according to the laws of the constitution, taking in the hygienic agents of diet, exercise, sunlight, pure air, the influence of the body upon the mind and the mind upon the body, in our popular systems of education do not receive a tithe of the attention which their importance demands.

Yet, what is the object of education? Is it merely to accumulate ideas, facts, and statistics as a miser stores up gold, with no purpose but the mere pleasure of accumulation? Or, is its object to discover the laws and principles upon which the world and all the beings and objects which inhabit it are governed, with a view to applying them to the amelioration of man's condition, to giving him a higher conception of the object of his existence here, and a more lofty idea of the power and benevolence of that Being toward whose purity and goodness it is his peculiar privilege to aspire?

If this be the object of knowledge, then, obviously, a thorough acquaintance with our own mental and physical constitution is the foundation upon which it must be built. Without this knowledge we are mere blind leaders of the blind—seeking to use implements of whose existence even we have never learned, and to accomplish results without having any definite idea of the steps by which they may be attained. J. MC N.

THE TYPE-WRITER.

AMONG the latest of our modern improvements, the type-writer, phonography, and telegraphy are perhaps the most useful and prominent; and as these relate intimately to intellectual culture and the diffusion of knowledge, they stand pre-eminent in the line of utility and public benefit. We have had phonography in use in our office for nearly thirty years, and for the last two years this useful and excellent article, the type-writer; and considering the great amount of writing which it is necessary for us to do in making out written descriptions of character and in maintaining a large correspondence with customers, we hardly see how we could now do without it. A person familiar with its use can write about three times as fast as a good long-hand copyist, and nearly three times as much matter can be put on the same amount of paper, thus serving to lessen postage and save stationery, time, and clerical force. Short-hand writers are learning that it saves them a great deal of nerve-shattering labor as well as time in copying their notes. And it is contemplated by some of our county officials to copy deeds with the type-writer, thus putting the important matter in print instead of manuscript, and then binding the sheets into volumes for filing in the county register's office. It does not require more skill to run one of these machines than is required to run the ordinary sewing-machine; consequently it is not a difficult instrument to understand and operate, and the immense advantages which it affords offer great inducements to its adoption. We know many short-hand writers whose long-hand is poor and not well adapted to engross their work. To them, especially, we recommend the use of the type-writer, and many of them could afford to own one in order to obtain and hold a desirable situation. The price of the type-writer, complete, is $125. Any of our friends who desire to do so may order them through this office, and we will see that the selection is properly made.

It is only by training all together—the physical, intellectual, and spiritual elements—that the complete man can be formed.

THE VENTILATION OF SCHOOL-HOUSES.

IT will be well to consider our subject under two heads—First, the need of ventilation; second, the means to secure ventilation.

I. *The need of Ventilation.*—Pure atmospheric air is essential to health. Such air consists principally of nitrogen and oxygen, in the proportion of about four parts of the first to one part of the second. There is also a very small proportion of carbonic acid gas. Of these gases, the specific gravity of carbonic acid is greatest, of oxygen next, and of nitrogen least. These gases do not form a chemical compound, but a mere mechanical mixture, and they are as distinct in the air as so many grains of wheat and corn mingled in a measure [*Steele.*]

In the act of respiration, the oxygen, the life-giving principle of the air, is eliminated, and carbonic acid is given out. The proportion of oxygen gas which atmospheric air contains, is about twenty-one gallons in every one hundred; but after it has visited the human lungs, this proportion is reduced to sixteen or eighteen in one hundred, and sometimes lower. The lungs extract from one-seventh to one-fifth of its oxygen.

"The oxygen enters the cells of the lungs, and is absorbed by the minute vessels which spread over the cell walls. Within these vessels it combines directly with certain constituents of the flowing blood, and proceeds with it in its ceaseless current through the arteries and veins."

The first important function which the oxygen abstracted from the air discharges within the breathing animal is, that it helps to build up the solid substance of the muscles, cartilages, and skin. Its second valuable service is to combine with the waste matter of its several parts. By so combining, the oxygen renders soluble, and therefore easy to be removed, what would injure the animal's health if allowed long to remain within it. The third useful purpose which it serves, is to convert the fat, starch, sugar, gum, and similar constituents of the food, into the carbonic acid and water which are given off from the lungs [*Johnson*]. By this chemical transmutation, animal heat is produced. The inhalation of oxygen is much like throwing fuel into a furnace. Physical exertion causes more rapid and deeper breathing, hence the inhalation of a greater quantity of oxygen, and consequently a greater evolution of animal heat.

But while oxygen is thus essential to animal life, carbonic acid gas is its deadliest foe. "We exhale constantly," says Professor Steele, "this poisonous gas. . . . If means are not provided to furnish us fresh air constantly, we are compelled to re-breathe that which our lungs have just expelled. The languor and sleepiness we feel in a crowded assembly are the natural effects of this narcotic poison. The idea of drinking in at every breath the exhalations that load the atmosphere of a crowded, promiscuous assembly, is disgusting as it is noxious."

There are many incidents which clearly and forcibly illustrate the fatal consequences of breathing an atmosphere which has been exhausted of its oxygen, and loaded with this deadly fluid One of the most striking of these was an occurrence which took place in Calcutta in the year 1756, when one hundred and forty-six Englishmen were immured in a dungeon eighteen feet

square, having only two small windows on the same side to admit air. In six hours ninety-six of them had died from suffocation, after horrible sufferings; and in the morning, when the doors were opened, only twenty-three out of the whole number remained alive [*Hamilton.*]

Thus we see the necessity of pure air in the economy of life. Let us consider briefly the quantity of pure air thus necessary, that we may properly inquire into the best means of securing it.

The quantity of air which different individuals require, varies, as it also varies with the circumstances of the same individual at different times. But no physiologist pretends that less than seven cubic feet of air are adequate for a man to breathe each minute, while Dr. Reid allows ten feet [*Cutter*]. We may then safely assume eight and one-half cubic feet per minute as an average. A very slight calculation will show us in what time the air in any apartment which is not ventilated will become vitiated. Let me take an ordinary country school-house for an example. The room is perhaps 30 feet long, 25 feet wide, and 10 feet high. It will contain 7,500 cubic feet of air. In this room are seated say forty-five pupils, and at the average which we have assumed above, all the air in the room will be rendered impure and unfit for respiration in less than twenty minutes.

In this calculation we have considered the vitiation of the air arising from respiration alone. But suppose we were to take into the account the further vitiation of the air by the effluvia which arise from the persons and clothing of those present, especially the carbonic acid gas which is given off from the skin, and which is estimated by Professor Johnston at about one-sixtieth that which escapes from the lungs, and we should find this very limited time even much more contracted. And then, in addition to all this, in the center of this room of which we are speaking, there is in all probability a hot stove blistering and scorching the air, and contributing by its escaping fumes to the deadly agent that is bearing down upon the energies of teacher and pupils alike.

What preserves such a school from speedy destruction? How comes it that any one lives to emerge from its portals? The answer is, that no room is made "air-tight." The pure atmosphere outside seeks out and rushes in at those numberless crevices and crannies in which every country school-house abounds, and does something toward mitigating the horrors within. But the effects of this impure air may be easily seen in the pale countenances and the languid manner of those who breathe it, and, alas! in the enfeebled health and premature death of many who had promise of long and vigorous life.

Nothing so essential to man's life and happiness as the pure atmosphere; nothing so abundant as the sweet air of heaven that blows so freely over land and sea, over hill and plain; and yet, in many places, how scarce it is. In how many of our schools may be seen the pallid cheek, the contracted brow, the white lips that speak of a close and vitiated atmosphere, while all around the house the free winds are revelling and seeking admittance. Such a spectacle is suggestive of the humorous poet's plea for "pewer Are:"

"But o Sextant; there are I Kommodity
Wich's more than gold, wich doant cost nothin,
Worth more than anything excep the Sole of Mann.
I mean pewer Are, sextant, i mean pewer Are!
O it is plenty out o dores, so plenty it doant no
What on airth to dew with itself, but flys about
Scatterin leaves and blowin off men's hatts;
In short, its jest 'free as are' out dores.
But o Sextant, in our church its scarce as piety,
Scarce as bank-bills when agints beg fer mischuns,
Wich some say is purty often."

II. *Means to secure Ventilation.*—Much has been said and written on the subject of school-room ventilation. It is of only comparatively late years that the matter has received any attention whatever, and that any special means have been contrived to secure ventilation. In fact, it is only of comparatively late years that there has been any special need of such means; for formerly the rude log structures that bore the name of school-houses, with their huge open fireplaces occupying almost the entire one end of the building, were furnished abundantly with the very best means of admitting the fresh air on the one hand and of removing the impure air on the other.

The old-fashioned open fire-place has never been improved upon as a ventiduct for the escape of foul air, and where such an ar-

rangement exists, which, however, is but rarely, if at all, in our school-houses, by simply lowering the upper sash of the windows on opposite sides of the room a few inches, as effectual a means of ventilation will be secured as can well be had in any other way. But in the absence of such arrangement as this, some means must be contrived to answer the same purpose. The heating and ventilating of school-houses, churches, public halls, etc., has become an art, and in the construction of first-class buildings of these kinds, men who make this art a specialty are employed to exercise their skill, just as the stair-builder and the plasterer are employed; it is in school-houses of less pretensions that what is here written is intended to apply.

There are methods of ventilating school-rooms which are within the reach of every school-board and the skill of the most ordinary house-builder.

In the first place, the ceiling of every school-room should be at least twelve feet high. This would admit windows of six feet in height, and the sashes for these windows should be hung in such a manner as to allow them to be lowered from the top as well as hoisted from the bottom. The advantages of this arrangement are so obvious that it is not deemed necessary to specify them.

Again, in every one-story school-house there should be an opening in the ceiling. This aperture should be at least three feet square in a room 25 by 30 feet, and it should have a valve or cover so arranged that it can be readily opened or closed from the floor of the room. In addition, there should be a slat window in each gable end of the loft, so as to permit a free escape of the air passing out of the school-room into the loft.

Finally, there is the ventilating flue. This flue may be built of either boards or of brick; it should be made smooth on the inside, so as to offer as little opposition as possible to the upward current of air; and, whenever practicable, it should be built either alongside or in front of the smoke-flue; and it should extend from the floor to a point two or three feet above the roof. By placing it in this position, the heat from the stove rarefies the air in the ventiduct, thus causing it to rise more rapidly, thus establishing a more perfect circulation, while also it may be built into the chimney after coming above the roof, which is an advantage.

Near the bottom of this flue should be an opening of the full size of a horizontal section of the tube itself. This opening should be covered with a wire screen. Close to the ceiling of the room should be another opening into this flue, of the same size as that below. This upper opening should have a hinged door to it, and so arranged that it may be opened or closed at pleasure from the floor of the room.

The operation of this flue is exceedingly simple, and depends altogether on natural causes. When the upper valve is closed, the higher strata of air in the room are successively displaced by the warmer air from the stove or furnace, rising above them, and causing them to descend and displace an equal volume of cold air below, which is necessarily forced out of the room through the lower opening or valve. This process goes on till the whole air in the room becomes too hot for comfort, or requires change for the sake of health; when, the upper valve being opened, the hottest air near the ceiling rushes out through the flue till the air in the room is again reduced to a proper temperature, or restored to the required state of purity.

In relation to the management of the flue, it need only be added, that the upper valve should invariably be opened before closing the school-room for the night, in order thoroughly to clear it of every portion of the air which was in it during the day, and to insure its being filled with a full supply of fresh, pure air for next morning; and that in most cases the same thing should be done at noon. The upper valve should be closed, however, an hour or half an hour before the assembling of the school, according to the size of the room and the state of the weather, in order to have it comfortably warm for the pupils.*

But it is not only necessary to conduct

* For the following table I am indebted to "Pennsylvania School Architecture," by Dr. T. H. Burrowes; from which also I have transferred several of the foregoing paragraphs.

foul air from the room; it is also necessary to introduce fresh air. It is usual to depend for such supply on the openings around doors and windows, etc.; it is better, however, to close these, and bring in a supply by a conducting tube. It has been recommended to have the opening of this tube just under the stove, with a movable cover, so as to admit air when needed, and to be closed when not required. But cold air does not rise readily, but spreads out over the floor, thus maintaining a frigid stratum below, causing the feet and lower limbs to be cold, while the upper parts of the body are comfortably warm. Hence it has been recommended, and apparently with reason, to have the cold air duct to open immediately *over* the stove; the cold air will then fall down upon the stove and become heated before its dispersion through the room.

Many of our school-rooms are provided with no other means of ventilation than what is furnished by opening the door or raising the lower sash of the windows. This is not only a very ineffective means, but the latter is especially a very dangerous one. Many a youth has contracted a cold in that way, that has pursued him to the grave. Teachers should be careful that their pupils are not thus exposed to a draft of air. Better to adjourn the school for a few minutes, throw wide-open the door, and raise the sashes, until the atmosphere of the room has been renovated, than subject children to risk of disease and death.

In concluding this subject, we would urge upon the teacher to secure ventilation by *some* means. The present convenience and future welfare of himself and of his pupils alike, depend very largely upon the purity of the air they breathe. It has been truthfully said, that man's greatest enemy is his own breath. The life-and-health-sustaining element waits without, seeking admittance; open the way, and it will come in freely; open the way, and the enemy will fly swiftly at its approach.

LONGEVITY OF THE MARRIED AND SINGLE.—By the statistics of M. Bertelon and others, in a discussion of the subject before the French Academy of Medicine in 1871, from 25 to 30 years of age married men die at the rate of 6; the unmarried 10; and widowers at 22 per 1,000 annually. From 30 to 35 years, the deaths among the same classes respectively are 7, 11, and 19½; from 35 to 40, 7½, 13, and 17½ per 1,000, and the same favorable conditions to the married continue at greater ages. But married men aged from 18 to 20 die as fast as men from 65 to 70.

Among women marriage is not quite so favorable as among men. From 30 to 35, wives die at the rate of 9, and spinsters 11 per 1,000. Under 25 the mortality of wives is a little greater than among single women. After 40 years of age, the longevity of married women is much greater than that of the unmarried.

The probabilities of life in this connection are—a man at 25 who marries has an expectation of 40 years' married life; if he does not marry, his expectation at that age is only 35. A woman who marries at 25 may expect to live until she is 65; if she remains single, to 56 years of age. Widowers and widows are nearly as badly off as those who do not marry.

In this comparison we can discern the operation of natural or organic law. They who marry fulfill, at least to a degree, the ordinance written in their very constitutions, and exercise certain faculties specially adapted to the domestic relation. They who do not marry are either deficient in or ignore some of the most important functions of humanity.

LETTERS TO A SON IN COLLEGE.

No. VII.

OBEDIENCE TO SANITARY LAW.

MY DEAR BOY:—In the foregoing letters I have taken a rapid survey of those parts of the human body most liable to be abused through ignorance of the laws and conditions which preserve and impair their functions. I have endeavored to so state and illustrate those laws that you may clearly perceive their importance, and readily apply them to the formation of habits which will conduce to your highest physical health and enjoyment. But I deem the subject of too great importance to dismiss it without reviewing a few points, which, in conjunction with what has gone before, it will be profitable for you to consider.

I have endeavored throughout these letters to inculate the doctrine that, aside from hereditary influences, health and disease are the results of our own conduct, and that by thorough acquaintance with the laws which govern our physical frames, we may so modify our habits that we may reap the reward of a long life of health and physical enjoyment. By the common sentiment of men, a general assent is given to this opinion. But it is to be regretted that it is not allowed a universal application. If a man in the heat and exhaustion of severe muscular exertion should throw off his coat and cast himself in the shade where a chilly wind would blow over him, every one would readily admit that the cold, the rheumatism, or the congestion which would be likely to ensue would be the natural result of his conduct, and they would denounce his course as most unreasonable and imprudent. But if a person by long-continued indulgence in close mental application and muscular inactivity were to develop dyspepsia, or serious nervous disorders, there are few who would perceive the connection between the habits of the individual and his physical disability. To the ignorant the disease would appear unaccountable. The religious would consider it a mysterious dispensation of Providence. But they who are familiar with the laws which govern the human frame, and the conditions which preserve and impair its health, would recognize in the dyspepsia or the nervous disorder the natural results of the habits of the individual just as clearly as the most careless would perceive in the cold, the rheumatism, or the congestion, the consequences of the sudden chilling of the body.

Now, the conduct of these three classes of persons in such circumstances would, we would naturally suppose, be very much in accordance with their beliefs. Those who regard sickness as the result of causes which we can not comprehend would simply meet it with stoical fortitude. Those who consider it a dispensation of Providence, sent upon them for their good, would bear it in humble and prayerful resignation; while those who see in it only the natural consequences of the violation of laws which govern the human constitution, would set themselves at work to ascertain those laws, and yield them obedience, as the means ordained by the Creator of avoiding the pain and suffering which are its attendants.

Whatever may be the expressed opinions of men in regard to the sources of ill-health, their conduct, when sickness comes upon them, abundantly shows that either in its production or its removal, it is associated with causes more or less under our control. For neither the ignorant nor the religious hesitate a moment, when they fall seriously ill, to send for a physician, the most skillful they can find, and willingly make any sacrifice which will promote their recovery. In this their conduct is most inconsistent with their belief: for if the causes of disease are inscrutable, then the rules which the physician lays down as to diet, pure air, sunlight, exercise, etc., for the recovery of his patient, are useless. If, again, sickness is sent upon us for our spiritual good, to wean us from the world, and to turn our thoughts to Heaven, then any attempts to deliver ourselves from it is rebellion against the expressed will of the Almighty, and merits His

severest punishment. And the great army of physicians, whom all regard as good and honorable men, is merely a force systematically trained to do battle against the decrees of Heaven.

It will be useful for us to notice, in this connection, the great advantages which have flowed from the progress of physiological knowledge. "A hundred years ago," says Andrew Combe, "when the pauper infants of London were received and brought up in the work-houses, amid impure air, crowding, and want of proper food, not above one in 24 lived to be a year old; so that out of 2,800 annually received into them 2,690 died. But when the conditions of health came to be a little better understood, and an act of Parliament was obtained obliging the parish officers to send the infants to nurse in the country, this frightful mortality was reduced from 2,690 to 450."

Until a comparatively recent period, the plague frequently visited the great cities of Europe, and carried off its victims by the thousand. London in particular was visited by a plague in the reign of Charles the Second which carried off nearly 70,000 of its inhabitants. The people of those times regarded these calamities as the dispensations of an inscrutable Providence. We, from our stand-point of advanced knowledge, regard them as the consequences of the natural effect upon the human organism of a vitiated atmosphere, arising from the accumulated filth of a dense population. Acting upon this knowledge, health-boards are established in our cities, whose duty it is to investigate and report all causes which are detrimental to the public health, that they may be removed by the proper authorities. Thus do we escape the frightful calamities which visited our ancestors.

Small-pox is another of these ancient scourges which carried off their thousands annually. Now 99 are saved, where formerly 100 would have been lost. Several generations ago the inhabitants of many districts suffered greatly from periodic returns of fever and ague. But by draining, an improved system of agriculture, the building of better dwellings, the removal of dung-heaps to a distance from the houses, the filling up of cess-pools, etc., these regions have been rendered highly salubrious.

In the light of these facts and principles, I think we can not escape the conviction that health is very much a matter of knowledge and obedience; and that we may indulge a well-founded hope that the progress of physiological knowledge will in the future, as it has done in the past, do away with a very large proportion of the evils which we suffer from sickness and disease. Let this once become a well-settled conviction in the minds of any community, that all the miseries which they suffer from ill-health are the results of causes which might be removed by a knowledge of the laws which govern the human frame, and they will immediately set themselves about acquiring that knowledge, and securing such instruction and training for their children as will develop in them sound constitutions, and enable them to reap the advantages of health down to old age. But let them look upon ill-health as the result of causes which they can not comprehend, or as the inscrutable dispensation of Providence, which it behooves them to bear in humble resignation, and they will continue to suffer and groan, and to transmit to future generations a heritage of woe.

Perhaps the chief cause of the great popular indifference to the conditions of health lies in the fact, that "health is more frequently undermined by the gradual operation of constant, though disregarded causes, than by any great exposure of an accidental kind." In other words, "because sentence against sin is not executed speedily, therefore the hearts of men are set in them to do evil." Because we are not thrown upon a bed of painful sickness by a single over-indulgence of appetite; because we are not immediately smitten with a wasting consumption, by breathing the vitiated atmosphere of an over-crowded room for a single evening; because a wasting fever does not result from a single exposure or over-exertion, therefore we are apt to live in utter disregard of the penalty which accompanies every violation of physiological law just as truly as though it came upon us like a thunder-bolt from heaven. But we should remember that the fact that sentence against

sin is not executed speedily is a most benevolent provision for our welfare, because, in the various activities of life, we are constantly subjected to exposures and influences more or less injurious to health, but which can not very well be avoided. If we were to suffer some severe penalty for every such exposure, our lives would literally become burdens, and our practical usefulness would be well-nigh destroyed. We, indeed, do see enough of sickness to be able to appreciate, in a measure, the truthfulness of this observation. Nearly every one has an acquaintance possessed of a constitution so delicate that a slight exposure or over-exertion throws him upon a bed of sickness. We recognize the great disability which such a condition imposes upon man. How it takes away his courage, hope, and ambition, and thoroughly unfits him for the active duties of life! Let, then, those who are blessed with a more vigorous organization, while they rejoice in the apparent leniency of nature toward them, remember that no violation of her laws escapes her vigilance, and that, sooner or later, she will demand the fullest payment.

But some one will say: "If we must be on the constant look-out for dangers lurking in our pathways; if we can not move a step without estimating its consequences, we might devote our whole time to thinking of our own unworthy bodies, and our lives would be hampered by attention to trivial restrictions and regulations which would wholly unfit us for the vigorous prosecution of any useful enterprise."

To this I reply, in the first place, that the Creator has decreed us into existence, and imposed upon our bodies fixed constitutions and definite laws. From these laws there is no escape. Bars and bolts will not exclude them. Solitude will not leave them behind us. Prayers and sacrifices will not free us from their operation. There is, therefore, no other alternative left but obedience or suffering.

Again, the yielding obedience to these laws, which in appearance is so formidable, is so only because it so far transcends the notions in which we have been educated. The savage looks in wonder upon the handwriting of the civilized man, by which he is able to communicate his thoughts to friends at a distance. We gaze with hardly less wonder at the performances of the trained juggler or acrobat. But how simple a thing is writing to us who have been accustomed to it from childhood, and how easy to the trained muscles of the juggler or acrobat are his feats of strength and dexterity. The observance of the laws of health is, in like manner, very much a matter of training and habit. He who has never given any attention to diet, exercise, fresh air, sunlight, bathing, etc., would very naturally look upon the observance of set rules in regard to these matters as an abridgment of his liberty. He who has been accustomed to pamper his appetite with rich and highly-seasoned dishes, would indeed consider it a great deprivation to be obliged to restrict himself to the plain and simple fare of a true hygiene. And he who has been accustomed to habits of smoking, chewing, and drinking, is utterly lost when deprived of his accustomed stimulants. But let such individuals be trained to observe the simple requirements of health; let those requirements receive the sanction of their intellects and moral sentiments as promotive of their highest temporal happiness; and they will acquire habits of obedience which will grow and strengthen, and become more facile of performance, till all idea of obedience is merged into the natural aptitude to obey.

Our circumstances, it is true, are not always favorable to the observance of the laws of health, because of our association with those who neither know nor have any regard for them. Let the counting-house clerk, the salesman, the saleswoman, the sewing-woman, the mechanic, the apprentice—any one whose time and services are at the disposal of another, disclaim against any feature of his mode of life as injurious to health, and he will likely be treated with contempt and ridicule by his associates and his employer, and if he persist in his complaint, he will be sure to be dismissed from service as a perverse and unreasonable subject. So the judge, the lawyer, the juryman, however clear and decided may be their views in re-

gard to the healthful performance of respiration, must sit in the same crowded, ill-ventilated room with their ignorant and indifferent companions, and be subjected to the same unwholesome influences. However advanced may be any man's ideas on education, civil or social polity and reform, he can not advance one step without the support of his fellow-citizens. He must educate them up to his own standard before he can reap the advantages of their coöperation. It is thus that men of enlightened views are hampered by the clogs of ignorance, and it is thus that the command, "Love thy neighbor as thyself," comes home to every man's door with a selfish, as well as a generous and exalted meaning; for it is only as we lift our fellow-men up out of their hurtful customs and prejudices that we ourselves are freed from their deleterious influences.

Just here let me impress upon you the importance of independence in thought and action, and of subjecting the common opinions and practices of men to the most rigid scrutiny of an enlightened understanding. It was want of independent thought which, in past ages, bound the multitude in slavish obedience to their leaders. The civic and religious rulers loved ignorance in their subjects, because it was inimical to free thought and favorable to that blind reverence for dogmas, forms, and ceremonies by which intellect was obscured, and the supremacy over the unthinking multitude was maintained. With the invention of printing, and the diffusion of knowledge, thought made an advance on feeling and began to assert its rightful sway. But, after centuries of progress, thought is still ruled in a great measure by feeling, and we find even well-educated men clinging pertinaciously to the opinions and practices in which they have been educated, and refusing to listen to any voice of reason which would demonstrate their absurdity. The man who upbraided the boy for venturing on the innovation of dividing the wheat in the bag on the horse's back, instead of conterbalancing it with stones, because that had been the custom of his fathers, is hardly an exaggerated type of this class.

Now I wish you to cultivate an independence of thought, a liberality of mind, and an acuteness and comprehensiveness of intellect which will enable you to pass an intelligent judgment upon the opinions and customs of society, and to stand firm in what your reason tells you is the truth. Condemn nothing which you have never investigated. Be ever ready to receive evidence upon that which can not be demonstratively proved. Be firm only in that which an enlightened reason tells you is the truth. Thus will you be able to rise above the pernicious opinions and practices of society, and be among the first to reap the advantages which flow from those advanced ideas, which will, one day, leap over the barriers of narrow-minded prejudice, and display to a wondering world the beautiful harmony and high utility of principles which so many of the present generation ridicule and despise.

One of the most common arguments urged against careful attention to the laws of health by those who would extenuate their evil practices, and fortify themselves in the self-indulgence of their perverted appetites is, that many people enjoy excellent health without any knowledge of these laws. Indeed, they say nearly all our centenarians are wholly indifferent to these matters. They live very much as other people do; smoke, chew, and drink, when they feel like it, eat what is set before them, without restricting themselves as to time and quantity, or questioning the relative proportion of its constituent elements.

To this I reply, that isolated cases never prove a rule, and that, if our knowledge and observation were sufficiently complete and accurate, we might be able to trace, even in these apparently anomalous cases, the natural operation of these very laws for which we are contending. These centenarians are invariably the descendants of long-lived progenitors, and necessarily inherit sound, vigorous, and harmonious organizations, which enable them to resist for a hundred years those injurious influences which wear out men of less vigor in fifty. To arrive at definite results in regard to the weight of these isolated cases against the observance

of the laws of health, it would be necessary for us to be able accurately to estimate the amount of the inheritance of constitutional vigor, and the rate of its expenditure. Until we are able to do this, it may be well for us to open our eyes, and contemplate the other side of the picture with understanding minds and teachable dispositions.

It is estimated that, as a general rule, the length of an animal's life is five times the period of its growth to maturity. According to this estimate, the natural age of man would be about one hundred years. The fact that this age is sometimes attained, shows that it is within the capability of the race. But the facts that not more than one in 10,000 do reach it, that more than one-half of all who are born die before reaching maturity, that the average age to which men live is less than 40 years, and that the great majority of men hardly know, by actual experience, what vigorous health really is, would seem to indicate that there must be some deleterious influence at work to thus cut short the days of man, and entail upon him so much misery, especially since this great premature mortality is reserved for him alone of all the animal kingdom. What these deleterious influences are can only be ascertained by making the human constitution our study, and subjecting our habits and modes of life to the test of the laws which we find inscribed therein.

Again, some one objects, even those who make these laws their study do not appear to enjoy that immunity from sickness which it is claimed would result from obedience to them. This is, indeed, true to a considerable extent, but if we look at the matter with a clear understanding of the facts in each case, even this apparently formidable objection may be satisfactorily explained.

First, the individual may be naturally of a weakly constitution, and hence, with the best of care, can expect but moderate health. Or his knowledge may be imperfect, and his well-meant efforts rendered abortive from failure to take in all the conditions. Or again, he may thoroughly understand the laws and conditions of health, but fail in their application. In obeying these laws, as in obeying the precepts of Christianity, knowledge is one thing and practice is a very different thing. There must be the obedient, as well as the understanding, mind, if these laws and precepts would bear their fullest fruit. The obedience, also, must be complete and thorough, the result of rigid self-discipline in the daily practice of these laws, till it shall have acquired the influence over our conduct of fixed habit.

It should be remembered, moreover, that in this matter of promoting health, "a little knowledge is a dangerous thing." Many individuals become enthusiastic over the health reform, from having its claims presented to them in a forcible manner, and immediately enter zealously upon the study and practice of its precepts. They read everything which they meet with on the subject, and amid the great variety of rules and remedies which they find for preserving and restoring health, they expect to mark out courses for themselves which will lead to the very best results. But they often fail, and sometimes do themselves serious injury, by adopting courses and remedies, which, though useful in certain circumstances, fail to meet the requirements of their special cases. Beware of a "zeal that is not according to knowledge." Stick to the general laws of temperance, exercise, fresh air, sunlight, etc., which I have laid down for your observance. If you are well, obedience to these laws will preserve you in health. If you are sick, it is only as they operate in accordance with these laws that remedies will prove effectual in recovery. Do not dwell upon symptoms, and imagine that every pain or indisposition that you may experience is the precursor of serious disorder. Above all, do not fly for relief to every nostrum and specific which you see in print or hear recommended. Let your faith be implicit in the immutability of nature's laws. If sickness come upon you, remember that it is simply the natural penalty for their violation, and let it impel you to investigate its causes, that they may be removed, and your health for the future be maintained by stricter obedience.

I have not entered upon the special consideration of the common vices of college

life, because I think that to a person of your moral culture, a simple appeal to your higher sentiments will be sufficient to preserve you from their practice. If we look abroad on society, we will find that only those secure and retain the sincere regard of their fellow-men who live habitually under the control of their higher faculties. These tend to lift a man up from low and selfish desires, and to send his thoughts outward on his Creator and his fellow-men, as the objects of his highest esteem. They condemn all practices which tend to injure or defile the temple of the soul. They reject any gratification of the lower feelings which does not minister to the well-being of the individual, and they love virtue, truthfulness, honor, and good-will to men for their own intrinsic excellence. To maintain these faculties in a state of habitual activity, is to live in accordance with the true nature of man, and to secure the highest standard of earthly happiness. While, on the other hand, to permit any gratification of the appetites or lower feelings which is not approved by these higher faculties, is to detract from the dignity of man, and to degrade his true worthiness of character. Thus the command to preserve ourselves free from all practices which degrade the mind and defile the body, is written in our mental constitutions as truly as in the Word of God; and, like all other commands of the Creator, wherever we find them inscribed, it appeals alike to our selfish and our generous sentiments. Obedience to the Creator's laws is not merely a duty which we owe to Him, and for the reward of which we must wait till we pass beyond the confines of the present life, but our own physical and mental comfort and happiness are involved in that obedience, and follow as its natural and immediate consequence. To preserve our minds and bodies pure and undefiled, to maintain them in health, and to rear them to the perfection of which they are susceptible, are thus duties which appeal alike to every consideration of self-interest in the present life, and to every consideration of happiness in the life to come. Affectionately yours,

PATER CONFIDENS.

HYGIENE IN ENGLAND.

IN the "Plain Directions for Preventing the Spread of Infectious Diseases," circulated by Dr. Maclagan, Health Officer for Hexham, England, are found the following excellent suggestions for the preservation of health, which form an excellent epitome of hygienic principles:

I. HABITATIONS.—All dwellings should be free from dampness, be freely ventilated, and have abundance of daylight.

1. "*Overcrowding* in houses is very injurious to health. Any house or part of house, so overcrowded as to be dangerous or injurious to the health of the inmates, whether or not members of the same family, shall be deemed a nuisance, liable to be dealt with summarily in manner provided by the Act."—38 and 39 Vic., Chap. 55, Sec. 91.

2. *Cleanliness* is essential to the preservation of health. The ceilings of houses should be frequently whitewashed and the rooms freely swept and floors washed.

3. *Fresh air* should be admitted into all bedrooms in the morning, by opening windows and doors. Bed coverings should be thrown down and exposed to the air for some time before the bed is made.

4. Chamber vessels should not be allowed to retain their contents and remain in any room longer than is absolutely necessary.

II. CLOTHING.—The body should be well covered. In winter or cold weather, flannel should be worn next the skin. In summer, if flannel be found too oppressive, some lighter fabric may be used, but this should invariably be *woolen*. Linen should be frequently changed.

III. FOOD.—Food should be plain, wholesome, and fresh. Meals should be taken, if possible, at regular periods. Infants should have no other food than breast milk until the first appearance of teeth, when small quantities of light farinaceous food may be given in addition. If there is a deficiency of breast milk, cow's milk diluted

according to circumstances with tepid water and a little sugar may be given. No child ought to be older than nine months before being weaned.

IV. PURE DRINKING WATER should always be used. No water which can be suspected of containing any contamination from sewers, privies, or drains should ever be used. Pure water should be clear, colorless, and free from smell, but all such water is not necessarily pure, but may contain sewage, although it is bright and sparkling. All water should be filtered; but filtration will not separate sewage, but will only separate solid matters. A cheap filter may be easily made thus: Plug the hole of a flower-pot loosely with a piece of sponge, place a layer of powdered animal charcoal about one inch thick, then a like quantity of clean sand, and on that some coarse gravel. These should be frequently changed. The charcoal may be burned over again. It is a wise precaution, when any doubt exists as to its purity, to *boil* water before use.

V. EXERCISE.—A moderate amount of exercise should be taken daily.

A REMARKABLE CASE.

THE following letter, received some time ago, briefly narrates a case of spinal disease, which is certainly of the most extraordinary character, and illustrates, in a style the most cogent, the intimate relationship of mother and child before the birth of the latter:

EDITOR PHRENOLOGICAL JOURNAL:—I send you an account of Hydrocephalus, in a child, which for its origin and terminus is equally remarkable. On November 30th, 1875, I was summoned in great haste by a Mrs. R——, of Poughkeepsie, N. Y., to see her child, whom she supposed to be dying. I found a child four and a half months old, with a head twenty-three inches in circumference. At the base of the spinal column, I found a small, soft tumor, from the central and most prominent part of which was a constant and rapid dripping of clear water. This water evidently drained from the cavity of the skull, through the length of the spinal column, and discharged at the coccyx. This drainage continued for more than a day and a half, and discharged during that time more than a quart of water. The integuments of the skull rapidly collapsed; the eyes looked wild and anxious; the pulse beat regularly, but excitedly. I gave it no medicine. It thus lay about thirty-six hours, then died, slightly convulsed.

In answer to inquiries, the mother stated that about four months prior to the birth of her child, her husband had kicked her violently upon the base of her spine, on the exact spot where the tumor was on the child. It would therefore appear that the child received an injury upon the base of *its* spine through the medium of its mother, which culminated in an extensive watery effusion upon the brain, which effusion was subsequently discharged at the *very point* where the prime injury was received.

In my opinion, the mental emotions of the mother—after her physical injury—produced the dropsy of the child's brain, and that it was *not* a reflexed action of a physical injury the child suffered on the spine.

I have read much of ancient and modern medical reports, and never have heard of a parallel case. DR. E. H. BARTON.

Poughkeepsie, N. Y.

ORIGIN OF THE CIGAR.

The Devil, one day in a sad, listless mood,
Had lain himself down on the edge of a wood;
But, bent on some mischief, he cast his eyes round,
'Spied near him a bunch of coarse leaves in the ground;
And pulled the tough things, which he crushed in his fist,
Then rolled out, and worked at, and gave them a twist;
Then grinned at his work with satanic delight.
With his old brimstone tail he then struck up a light,
Set the end of the weed with a spark all on fire,
And found the result was all that Man could desire.
The stench that arose was so horribly dreadful,
Bugs, beetles, and spiders swooned off by the handful.
"Ha, ha," said old Nick, "now I am off to the city;
I'll kick up a row; if I don't, more's the pity."
From that day forthwith there arose such a din,
Nick wagged his old tail, and looked on with a grin,
While now in each household the women made war
'Gainst Satan's invention, the potent cigar.
They were right; for the cash that was squandered that way
All ended at last in the Devil to pay.

THE LIMITS TO PHYSICAL CULTURE.

WE have frequently had occasion to dwell upon the fact that, while moderate physical culture is a great benefit—indeed a necessity, to insure a proper balance of mental and bodily powers, and consequent health and longevity—physical overculture is a great evil, leading to results diametrically opposite to those sought to be attained. At one end of the series is a constitution weak and unfitted to resist disease or the effects of labor; on the other an organization strained to its utmost and ready to yield under the slightest addition to the stress. Obviously between these extremes there must be a mean, up to which all culture is beneficial, and beyond which all is overculture. The question is, however, whether that mean is in the nature of a personal equation for every one, differing for each individual constitution, or whether it is possible to formulate general laws, true for all systems. The tendency of modern investigation in all cases relating to the science of living, is generally favorable to the latter view. Mr. Charles Darwin sends out his formulated questions the world over, and deduces results from replies proportionally considered. Candolles does the same in his elaborate investigations into the antecedents of scientific men; the statistics relative to the recruits for our army we have shown, in recent articles, to admit of valuable deductions relative to our national characteristics; and we might add numerous examples, all showing that that which is proved true, on the average, for a large number of persons, may with reason be assumed to be true of an entire class, or even a race, when surrounded by generally similar conditions of life.

Now, in the case of physical culture, the point specially to be determined by actual physiological investigation is, to what extent the body may be benefited. This known, any one may easily discover for himself when the limit is reached, and will understand that to carry his training still further is a positive disadvantage and injury. Such an investigation has lately been made by Dr. Burcq, of Paris, in the *Ecole de la Faisanderie*, a gymnasium where are drilled the soldiers who are destined to be the gymnastic instructors of the French army. No better set of men could be selected for examination, for the reason that each individual is virtually intended hereafter to serve as a model for others, and therefore his physical culture is brought to the best possible state. Dr. Burcq continued his investigations with the utmost care and minuteness for six months, during which period the progress of over a thousand men was closely watched and criticised. As a general result, he tells us now that gymnastic exercises—

1. Increase the muscular forces up to 25 and even up to 38 per cent., at the same time tending to equilibrate them in the two halves of the body.

2. Increase the pulmonary capacity at least one-sixth.

3. Increase the weight of men up to 15 per cent., while, on the other hand, diminishing the volume. This augmentation exclusively benefits the muscular system, as is demonstrated by its elevated dynamometric value.

And Dr. Burcq further observes that, during the first half of the six months' course at the school, the increase of force was most markedly noted.

To Dr. Burcq's admirable studies upon this body of trained gymnasts may be added those of M. Eugene Paz, who for a long period has been observing the results which methodical physical exercises produce in certain invalids and in a large number of people of various callings, notably artists, literary and business men, and others whose muscles are normally less voluminous than those of the picked soldiers at the *Faisanderie* School.

By means of a variety of ingenious mechanical apparatus, and by a course of investigation wholly different from that of Dr. Burcq, M. Paz reaches precisely the same results. He notes especially the increase in weight and decrease of volume of the body above referred to, and also the augmentation of pulmonary capacity. Three operatic singers who were rigorously trained for a year attained a maximum lung power correspond-

ing exactly to an increase of one-sixth. It follows, therefore, that Dr. Burcq's results may be considered in the light of a general law, and likewise as a guide to what is correct physical culture. In this view we commend them to the attention of college authorities and students.—*Scientific American.*

We would add a word or two, for the purpose of admonishing those who are disposed to taking violent exercise of any kind in the hope of increasing their strength. No great development of muscular power can be obtained except at the expense of some important organ. Acrobats and gymnasts who perform wonderful and unnatural feats usually break down early in life from derangement of the heart or from spinal weakness. Some out-of-door exercise is necessary for good health, and it can be obtained best in ways which subserve economical purposes. Instead of tossing dumb-bells, swinging clubs or tumbling over parallel bars, an hour's trial with the spade or the hoe in a garden (which every one should have), or a twenty minutes' bout with the axe and some Virginia pine wood, would afford ample play for the muscles, while a game or two of croquet or some other sociable sport of a moderate order would afford a pleasureable variety. Walking, not in the lounging style, but a brisk, steady tramp, is one of the best forms of exercise one can take.

PINE-APPLE.

THE PINE-APPLE.

The Early Reputation of the Pine-apple—Habitat—Apperance of Plant—Culture—Wholesomeness—Other Uses—Varieties.

Recipes: Dressing—Serving—Pine-apple Lemonade—Pine and Strawberry Dressing—Pine-apple Fritters—Muffins—Shell Dumplings—Canning Pine-apple.

WE are in the presence of royalty; let us render due homage. The "King Pine" claims our attention. Its appearance is not unfamiliar, as it stands: a fine aggregation of delicious fruits well preserved, with such a crown of leaves as no other fruit can boast, maintaining its dignity as long as its life, and when that is yielded, showering upon us such blessings of flavor and odor and delicacy as fully vindicates its right to the title of the king of fruits. But it is when seen in its native habitat, that it most fully vindicates its right to the royal title, standing as it does erect and alone in its place, surrounded by

such an array of bristling halberds as make no unworthy body-guard, with its artistic outlines added to its gorgeous hues.

When this title was first acknowledged we know not, but it seems to have been accorded on its very first appearance in the civilized world. Evelyn says, in 1668: "I was at a banquet which the king gave to the French ambassador. Standing by his majesty at dinner, in the presence, was that rare fruit called the King pine, growing in the Barbadoes in the West Indies. His Majesty, after cutting it up, was pleased to give a piece off his own plate to this worthiest of his courtiers, that he might taste as well as feast his eyes upon a novelty he had never met before;" but this further acquaintance produced only disappointment; "For, in my opinion," he continues, "it falls far short of those ravishing varieties of deliciousness described in Captain's Ligon's history and others; but it certainly was much impaired by coming so far." No, not even the King pine could set aside the laws of nature for the sake of gratifying a royal palate. It seems that Cromwell had received a present of this coveted fruit four years previous, but we have no gossiping courtier's report of the condition in which it was received by him. The latter is the first that is known to have been brought into England.

ITS EARLY REPUTATION.

It is no wonder that the gourmands of the age were beside themselves with desire for a taste of the rarity. It had been known by repute for over a century. Oviedo, who had early found and described it, had made great efforts to introduce it into Europe, but all in vain. The fruits perished long before the end of those dismally drawn-out voyages, while somehow they did not succeed in preserving any of the shoots or slips of the plant. It seems to have been first found in South America. A French monk first described it by its Peruvian name of Nanas, which was afterward modified to Ananas, its present botanical name, by Jean de Lery, a Huguenot chaplain, who remarked on its exhaling "so strong a scent, resembling strawberries, that it could be smelt when afar off in the woods, and so delicious in taste as to take rank unquestionably as the best fruit of America."

The description of Captain Ligon, referred to above by Evelyn, is a paragon of word painting. He says: "To close up all that can be said of fruits, I must name the pine, for in that single name all that is excellent in a superlative degree for beauty and taste is totally and summarily included. When it comes to be eaten, nothing of rare taste can be thought of that is not there, nor is it imaginable that so full a harmony of tastes can be raised out of so many parts, and all distinguishable. When you bite a piece of the fruit it is so violently sharp as you would think it would fetch all the skin off your mouth, but before your tongue have made a second tryal, upon your palate you shall perceive such a sweetnesse to follow as perfectly to cure that vigorous sharpness; and between these two extremes of sharp and sweet, lies the relish and flavor of all fruits that are excellent: and those tastes will change and flow so fast upon your palate as your fancy can hardly keep way with them, to distinguish the one from the other, and this at least to the tenth examination, for so long the echo will last." We quote this at length, for we lose our breath at the thought of such daring flights on our own account, and we know of no modern writer who has so seriously given himself up to the pleasures of the palate, as to be capable of such an analysis of gustatorial delectations.

HABITAT.

The first known successful journey taken by the pine was to the West Indies, where it was successfully cultivated, and whence the specimen above mentioned was brought. Soon after this, a Dutch gardener of Leyden, named Le Cour, succeeded in creating an atmosphere in which the royal fruit deigned to bloom, and in 1690 a plant was transferred thence to the royal gardens at Kew. Early in the next century Lady Mary Montague thus discourses of some which she saw on the dessert-table of the Elector of Hanover. After speaking of some other attraction, she says: "But I had more reason to wonder that night, at the royal table, to see a present from a gentleman of this coun-

try of two large baskets full of ripe oranges and lemons of different sorts, many of which were quite new to me; and what I thought worth all the rest, two ripe Ananasses, which to my taste are a fruit perfectly delicious. You know, they are naturally the growth of Brazil, and I could not imagine how they came here except by enchantment. Upon inquiry I found they have brought their stoves to such perfection that they lengthen the summer as long as they please, giving to every plant the heat it would receive from the sun on its native soil." In a few years "pine stoves" became common in the principal gardens of Europe, and pines were produced very much superior to any they could import without the aid of steam navigation, although they often cost as much as £5, or $25 each. But they show the advantages of cultivation, so that really superior fruit was produced, weighing from 4 to 8 pounds. Much larger sizes are also grown, some weighing even 14 pounds, but these are not of so good a quality. The British gardeners have paid much attention to their cultivation, and they talk about the Bicton pines as complacently as if they had quite naturalized them. A late English writer says: "Without exception, it is the most luscious fruit grown in England. Excepting the Burmese pines, and probably the fruit reared at Singapore, which rarely reach our market, the most notable specimens are the produce of this country." This is unquestionably something of a triumph, and if we did not feel that we were doing some work of a high order for the social and moral world, we should be annoyed to see British gardeners thus excel us in raising our own fruits. Perhaps as we gradually free ourselves from the waste of capital and time and brains now caused by the manufacture, sale, and use of intoxicating liquors we may be able to maintain the excellence of our own productions to a greater extent than we are now doing.

The pine is grown in great abundance in the West Indies, whence we usually get our supply. Here they are cultivated in parallel rows like agricultural crops. And Humboldt, a good authority, pronounces them of high excellence. In Surinam they grow spontaneously, in so great abundance that they are fed to the hogs. They have been introduced into almost all tropical countries, and are so easily propagated that in many of them they have gone wild and are looked upon as indigenous. This is the case in Sierra Leone, where they form almost impenetrable thickets and run out every other kind of plant excepting trees already established. They are found wild in other parts of Africa, and in various parts of the East Indies. They thrive well in the northern part of Australia, where a sufficient supply is raised for the Sidney market. Like our Indian corn, they follow in the footsteps of civilization, and even outrun it, blessing peoples and tribes who never heard of the new world.

APPEARANCE OF PLANT.

Those who have not seen the plant may imagine something between a century plant and a yucca, with leaves thicker than those of the latter, but not so thick as the former, from two to three feet long, and in most cases armed with spines, and of a dusty bluish sea-green color. From the center of these rises a stalk, from one to four feet high, producing, first, a cluster of blue or lilac flowers, numerous, small, and close, growing upon the sides of a long, thick, fleshy receptacle. The thick, fleshy calyxes of the flowers, and even the pistils and stamens, remain after the petals fall, and, together with the receptacle, form the fruit, which continues to grow in all its aggregate parts, as though it required the product of many flowers to produce one such magnificent fruit. The calyxes, swelling, inclose the remains of the stamens, which may be seen in the eye of each segment, and which are really a drawback to the fruit in dressing, as it can not be eaten without some elaborate preparation with the knife, nor even then can it be pared smoothly without great waste of the substance of the fruit. But these are absolutely forgotten or overlooked by all the numerous writers on the subject whom I have consulted. They seem to think that such deliciousness is worth any pains that might be required for its acquisition. The seeds, when found, are near the center of the

fruit, and about the size of wheat kernels. They are seldom found in the fruit brought to market, probably because their growth is too highly stimulated. They are quite abundant in the uncultivated fruit.

CULTURE.

Formerly the plant was raised from the seed, and it was considered a triennial, bearing fruit but once and then perishing. Now it is frequently raised in a year, and the common mode is to use the suckers, or young shoots, which grow upon the stem, and sometimes, but more seldom, the top that is removed from the fruit. These take root readily, and grow, after they are started, in very poor soil, usually sandy; and many are grown in hot-beds of tan-bark placed on horse-dung. Some of the best have been grown mostly in the open air, but the climate here would probably be too dry. They rejoice in heat and moisture, but soon spoil if deprived of fresh air. So thoroughly have the difficulties in the way of its culture been studied up and removed, that one cultivator declares that any one who can get stable manure may now grow pines.

The devices to which the gardeners resort may be worth a moment's attention. In one case, plants, in pots to which no heat had been applied, in the green-house, were brought to blossom early in the spring, and in May they were placed out in beds of leaves in the open garden. A bank was thrown up around them to shelter them from the wind, and the surface of the ground to some distance was covered with charred hay, which, by its blackness, so absorbed the rays of the sun as to keep off the night frosts and increase the warmth of the soil. Sometimes the temperature was below forty degrees, and on some days there was no sunshine—as is frequently the case in England—yet the fruit matured finely, weighing on the average four pounds, and one specimen went as high as six pounds. It was also as finely flavored as any fruits of the hot-house. In most seasons, however, this plan would not succeed at all. One of the latest plans is to have hot-water pipes under the beds of tan-bark, while special apparatus is devised for keeping the air pure.

It lives mostly on what it can get from the atmosphere, sometimes hardly taking root at all. One gardener raised it in loose moss. Dr. Lindley says that in South America they will grow when suspended in the house, or hung to the balustrades of the balconies, where they flower abundantly, filling the air with fragrance, but we have reason to suppose that these are a different variety. It is a curious fact that the long, gray Southern moss belongs to the same family, and the banana is nearly allied.

The British gardeners have very elaborate treatises on the pine and its cultivation, so that those who wish for practical assistance will know where to look for it. It would, however, convey to our minds a different idea from what it would to that of an Englishman if we were told that "this incomparable fruit is more easily brought to perfection than an early cucumber."

WHOLESOMENESS.

In vain we search through Pereira and such old authors for analyses of this distinguished fruit. Whether they were dismayed at its royalty, or took it for granted that nothing that might be said against it would be patiently received, we can not say. As for our modern chemists, they seem to be more deeply interested in finding something which they can turn into money — expectorants, cundurangoes, or some such wonderful and far-fetched piece of nonsense. They may not now be trying, as the old alchemists were, to transmute the baser metals into gold; but they are, and apparently with much greater success, coining gold out of men's indulgence of the baser passions and appetites. They consider it none of their business whether or not we get wholesome food, unless, indeed, they prefer that we should take that which is "at once agreeable to the eater and useful to the doctor," to quote one of their own number. Whose duty is it, if not of the medical man, when a new article of food is introduced into common use, to find out its constituents, and whether it will injure or benefit the partaker, and let us know about it? There is, however, a modest analysis somewhere showing malic acid. The acid, we confess, is rather sharp, but so are the acids to va-

rious other fruits, and that of the pine is much softened when the fruit is fully ripe. Moreover, we have effects from several other fruits of undoubted wholesomeness which are almost equally severe—such as some varieties of grapes, the lemon, and many others, like the barberry and the cranberry, which we do not like to use at all until we have disguised them with sugar. Our observation has hitherto failed to find anything unwholesome in this acidity.

There is, however, a serious complaint against the pine on account of the hardness and toughness of some portions of its fiber. For this reason it requires very careful mastication. We would recommend invalids, and those of weak digestion, to eat of it very sparingly. The objection is mostly mechanical, for the juice is admissible when the substance is not. This juice is very desirable as a flavoring for lemonade. Sometimes the juices of pines which are too ripe to keep long may be used in that way to good advantage.

The pine never breaks down in cooking, like the apple and some other fruits, though it does soften to some extent. Hence it is more seldom cooked than most other fruits, except for canning or preserving purposes. The pine-apple flavor which is so much used in candies and other confections and to flavor alcoholic drinks, is not usually derived from the fruit at all. Probably it is composed of common wine ether, combined with alcohol and butyric acid, and then dissolved in alcohol. This is a very good illustration of how little reliance can be placed on the so-called fruit flavors. If you use the fruit itself, or its juice, then you know you are safe and you are scarcely sure in any other way. The fruit and the juice are very easily canned, and if it were put up in small cans or in large vials, after the usual manner of canning fruit, it would often be found very convenient when the fruit itself is out of market.

The fruits which are brought to us in this latitude are usually picked when they are yet green, and we do not, therefore, get them in the delicious perfection which they have when ripened in their proper places. They keep for several weeks, but when they begin to decay, they go very rapidly.

OTHER USES.

In Jamaica the plant is used to make hedges, on account of its prickly leaves. The latter are also used for various textile purposes. When stripped of their pulp, by soaking in water and beating with a wooden mallet, excellent fibers are obtained for twisting into ropes and whips, besides being sometimes woven into cloth. There is one variety which yields a most delicate fiber, yet strong and durable. The web is called pine-apple cloth, and has been some years in the New York market, both for handkerchiefs and for dress-goods. It is as stiff, wiry, and sheer as good, fine, starched organdie, making a really beautiful fabric.

VARIETIES.

We have in the New York market two well-known varieties, or rather species, called the Strawberry pine and the Sugar-loaf pine. The former is much the more common; indeed, during the most of the season it is the only one in market. The shape is almost a perfect oblong, sometimes a little larger near the base. The color is bright, of a pleasant pinkish red and pale yellow, and the riper it is the more the red prevails over the yellow. The bracts at the top are short and thick and stiff, and the ends of the bracts which are seen upon the surface of the fruit are so prominent as to give it a somewhat rough appearance. The acid of this variety remains quite sharp, even after it is thoroughly ripened.

The Sugar-loaf is inclined to be a little larger, and decidedly longer; its shape is very well indicated in the name. The bracts are much larger, longer, softer, and thinner. The color of the fruit is a handsome dark green, with traces of pale yellow. As it ripens, the green becomes more dull, giving partial place to a dull yellow, but not entirely disappearing. The bracts are smaller than in the other sort, and consequently the fruit is smoother. On the whole, it is not so showy as the Strawberry pine, though to the initiated, it is much more attractive, for even when yet unripe it has none of the

harsh acid of the former. I can not find that it is any more difficult to raise. It costs little, if any, more in the market, though it is much more scarce. It comes a little later in the season. I have thus carefully described them both, not only that my readers may be able to avail themselves of the better sort, but that they may aid in getting up a greater demand for it. It is very possible that there are material points about this matter of which I am not informed; if so, I should be glad of any information from those who are better able to give it.

RECIPES.

DRESSING.—In handling, the tufted crown of the fruit is ignominiously, but most conveniently, made its handle. Holding it by this, remove the suckers, if there be any at the base of the fruit, and then, with a sharp knife, cut off the base, so as to present a good clean slice. Then cut off another slice, say a quarter or a third of an inch thick, and laying it on a clean board, with the sharp knife cut the skin from the edges right through the eyes. Then take the slice in the fingers and scoop out the remainder of the eyes, and trim off any bits of skin that may remain. Proceed in the same manner until all are pared; pile them up in a glass tazza and send to the table at once. Some cut the skin all off and dig out the eyes with a sharp-pointed knife before slicing, but this is more wasteful, more difficult, takes more time, and has no advantage but that of saving an inconsiderable amount of juice. Where many are pared, the parings are stewed or steamed, and the juice is made into jelly. The knife should be promptly cleaned, as the sharp acid is very deleterious to the steel.

SERVING.—The fruit should always be sufficiently ripe to serve without sugar. A glass plate and a silver knife and fork are the most appropriate to their peculiar character and shape. Even when sprinkled with sugar, the role should be the same. It is difficult to cut with a spoon, and when cut into bits, as is sometimes done, the beauty is gone, and the bits themselves look awkward in the teaspoon. The Sugar-loaf sort is more easily managed. The royal way of eating either is to take the slice in the fingers, as independently as you would an ear of green corn, and bite the succulent part, holding it by the center. The West-Indians pare it whole, and tear it to pieces by taking out mouthful after mouthful with a fork.

PINE-APPLE LEMONADE.—Take one medium-sized lemon and one slice of pine-apple to each pint of water. The pine need not be pared. Squeeze them both in the lemon squeezer. Make the lemonade with either cold or hot water, as you choose. Sweeten to the taste, if you can not bring your taste to the health standard, which does not require the sugar. This is wholesome, delicate, and refreshing, and it will quench thirst much sooner than when made with sugar.

PINE-AND-STRAWBERRY DRESSING.—Scald the strawberries and drain off the juice through a tammy or a hair sieve. Do not press the fruit, but let it drain thoroughly, then add about one-tenth part pine-apple juice, pressed from the fresh pines, or the juice from the canned fruit, with sugar to the taste. Place in an acid-proof saucepan and return to the fire, adding, when it boils up, a spoonful of corn-starch wet in water. Let it boil up once and dish. This is an admirable dressing for boiled rice, and for various kinds of puddings.

PINE-APPLE FRITTERS.—Mix one gill of soft oatmeal mush, one gill of nicely-boiled rice, one gill of Graham flour, and one-half pint of water, or enough to make a batter that can be conveniently spread out on a griddle. Then cut and pare slices of pine-apple, about one-eighth of an inch thick, rejecting the core; spread the batter on the griddle in cakes, a little larger than the slices of fruit; lay on the fruit and cover each one with a thin layer of batter; bake brown on both sides. Serve with a dressing of simple syrup.

PINE-APPLE MUFFINS.—Mix equal parts well-cooked rice, Graham flour, "B" oatmeal, and water, and bake in muffin rings twenty minutes, or until they will slip from the rings without sticking; then split in two slices, and on one place thin slices of pared pine-apple, sprinkled with sugar, immediately place over it the other half, and cover with a napkin. Let them stand in a warm place for ten minutes, and serve.

SHELL DUMPLINGS.—Take perfectly clean and deodorized clam-shells, or what other pretty shape you please, provided it be not of any material that will yield to the acid; oil thoroughly and half fill with nicely-boiled rice, then lay in some thin slices of pared pine-apple, cover it with rice and place in a steamer, cooking it fifteen or twenty minutes. Turn out of the shells on the dessert plates, and dress with powdered sugar, simple syrup, or the above pine-and-strawberry dressing.

CANNING PINE-APPLE.—Slice and pare your pine, then pile up the slices, and remove the center by cutting down and around it with an apple-corer; then cut the fruit into about eight wedge-shaped pieces, more or less, according to the size, or tear in pieces with a fork, West-Indian fashion; put into the preserving pan, with water enough barely to cover, and cook fifteen or twenty minutes, then seal up like any other fruit. Sugar can be applied when it is used.

JULIA COLMAN.

RECORD OF SCIENTIFIC DISCOVERY.

Recent Astronomical Items. — Dr. Henry Draper, of New York, and Mr. Huggins, of England, have been simultaneously at work upon the photography of stellar and planetary spectra, and have each obtained good impressions of the spectrum of Vega (*a* Lyræ), which shows peculiar broad dark bands, quite unlike anything in the solar spectrum. Dr. Draper finds that the spectrum of Venus exhibits at the purple extremity the same sort of weakening in photographic power which is observable in the spectrum of the sun near sunset.

On December 28th the observatory at Wilna, in Russia, was burned. The large refractor and photo-heliograph were destroyed, and only books of minor value were saved. The observatory has been of late years doing some very valuable work, and its destruction is a serious loss to science.

Ant Intelligence Limited. — In a fourth communication to the Linnæan Society (reported in *Nature*), on the habits of bees and wasps, Sir John Lubbock has illustrated by ingenious experiments his *modus operandi* of testing their faculties, dispositions, habits, etc., by something of a double F apparatus, whereby an interval of three-tenths of an inch, either by a drop from above or reaching upward the distance from below, alone prevented ants from gaining access to a covered glass all filled with larvæ. They evidently had not the acumen to surmount the three-tenths of open space, although they had for hours before been traversing the route and carrying off larvæ previous to the small gap being made. Industry was conspicuously shown by one specimen, which Sir John used to place in solitary confinement in a bottle for hours, and once for days; but on the moment released, it commenced its laborious larvæ-gathering propensities. It seems, from other experiments, that ants in difficulties within sight of their companions are by no means always assisted or relieved; other attractions, food and such like, possessing greater interest for them. On putting some specimens under the influence of chloroform, little or no notice was taken of those insensible by their companions, the tendency apparently being to let friends lie, and throw over the edge of the board strangers thus chloroformed. It seems that to get ants properly intoxicated with spirit for experimental purposes is no easy matter, some recovering too quickly, and others remaining so thoroughly dead drunk as to come under the head of impracticables; while between reeling friends and strangers the experimenter finds himself baffled. The sober ants are exceeding puzzled at finding their friends in such a condition. As a general rule, they picked up drunken friends and carried them to the nest, whilst they threw into the water and drowned strangers In some instances confusion arose, for a few of the strangers were carried to the nest, and friends tumbled into the water; but they did not return to the rescue of the friends, though strangers were afterward expelled from the nest. Sir John expresses surprise that ants of one nest perfectly well know each other. Even after a year's separation old companions are recognized and amicably received; whereas, strangers, particularly among the *Lasius flavus*, are almost invariably attacked and maltreated, even when introduced in the mixed company of old friends. But sight can not be acute. For example, in experiments food was placed on a glass slip a few inches from the nest, near the straight road to and from the nest being so familiar to the ants; but when the food had been shifted only a short distance from its first position it was long ere it was re discovered. Indeed, they wandered from a few minutes to half an hour in the most extraordinary circuitous routes before finding out the direct road between the nest and food, and *vice versa*. Slavery in certain genera is seen to be a positive institution — the Amazon ants (*Polyergus rufecens*) absolutely requiring slave assistants to clean, to dress, and to feed them, else they will rather die than help themselves, though food be close at hand. A curious blind wood-louse (*Platyarthrus Hoffmansegii*) is allowed house-room by the ants. It acts as a kind of scavenger, the ants taking little notice of the wood-lice, and even migrating, leaving them behind. Some new species of Diptera, of the family Phoridæ, he finds to be parasitic on our house-ants, and Mr. Vernal has recently described these interesting forms.

Structure of Blood Corpuscles.— *Editor* PHRENOLOGICAL JOURNAL: In the July issue of your periodical Mr. F. G. Fairfield discusses this question, and in support of his views gives a figure in which he professes to trace the course of the rays of light as they pass from the mirror on a microscope through the slide, object, and thin glass cover to the object-glass. It is upon this figure that Mr Fairfield rests his chief claims to a demonstration of his theory, and, therefore, if the principles used in tracing the path of the light are erroneous, the whole argument falls to the ground. With this, however, I am not so much concerned. What I regard as of more importance, is that the readers of the PHRENOLOGICAL JOURNAL should not be misled, in regard to such an important subject as the action of simple lenses, by statements which violate the most elementary principles of optics. Mr Fairfield says that "When a ray of light passes from a refracting medium of lesser into one of greater density, it enters the latter at right angles to the plane of its surface." This is not so. The incident ray is, in this case, bent from its path to an extent which varies with

the refractive power of the medium which it enters, and even in the case of the diamond, the most highly refractive substance known, this bending is not enough to bring it to a right angle. In the case of glass, it is about half what it is in the case of the diamond. It puzzles me to know where Mr. Fairfield could have obtained ideas so widely at variance with the facts.

Carrying out his theory as above enunciated, he states that in a sphere of glass the impinging rays all meet at the center of the sphere. This, again, is incorrect. Parallel rays, falling on a sphere of common glass, would be brought together at a point on the other side of the sphere and distant about a semi-radius from its surface. Convergent rays would come together at a lesser distance; divergent rays at a greater distance. In the case of a blood corpuscle (assuming it to be spherical, as represented by Mr. Fairfield), since it does not refract as much as glass, the rays would come to a focus at a greater distance from its surface.

Those of your readers who are not familiar with optics and yet wish to test this matter experimentally, can do so with the bulb of a broken thermometer. After emptying it of mercury (by slightly warming it), and filling it with a solution of salt in water, let it be used as a burning lens, or magnifier. In the first case, it will be found that it brings the rays to a focus at a point outside the bulb, and in the second it will be found that the point at which letters are seen most distinctly through it is distant a little more than a quarter of its diameter from its surface. This shows clearly that after passing the center of the sphere, the rays do not diverge as figured by Mr. Fairfield. I say nothing in regard to the fact that if the figure is supposed to be accurate, both the slide and covering glass will be found to be of impossible thicknesses, and that their influence upon the ray is very different from what Mr. Fairfield figures. The two mistakes that I have pointed out are so important that it is a pity to allow them to obtain currency without correction, and it certainly astonishes me to find that a writer who claims position as a professional microscopist should apparently know so little of the principles which govern the construction of the instrument that he uses.

JOHN PHIN,

Ed. Am. Journal of Microscopy.

Making Speech Visible.—At a meeting held at Salem, Mass., a lecture on "Visible Speech" was delivered by Prof. Graham Bell, who, by means of the drum in a human ear cut from a dead subject, has succeeded in producing a phonautograph. The ear is placed in the end of an ordinary speaking-trumpet; on speaking into the trumpet the drum is set in motion; this moves the style; the style traces the effect on a plate of smoked glass; and by means of a camera the curves and lines can be exhibited to a large number of spectators. The five vowels make five different curves; and, according to Mr. Bell, there is no such thing as a sound or tone pure and simple, but each is a composite of a number of tones; and the wavelets by which these are produced can also be shown on a screen. Tables of the various symbols have been drawn up, and found useful for educational purposes, as was demonstrated by a young deaf and dumb pupil from the Boston institution, who interpreted the symbols at sight.

Comparative Health of Leading Cities.—The Health Bureau of the German Empire reports, that during the week ending on the 27th of January last, the number of deaths to every hundred thousand of the inhabitants in the cities enumerated, were as follows:

Berlin	42	Copenhagen	58
Cologne	52	Stockholm	55
Madgeburg	56	Christiana	45
Strasburg	76	Warsaw	28
Munich	60	Naples	61
Augsburg	89	Turin	43
Dresden	38	Bucharest	59
Leipzig	34	London	40
Brunswick	41	Liverpool	55
Hamburg	48	Glasgow	49
Vienna	52	Dublin	58
Pesth	81	Edinburgh	41
Prague	95	Alexandria, Egypt	85
Amsterdam	56	Madras	121
Rotterdam	51	Bombay	65
The Hague	44	New York	47
Basle	66	Philadelphia	32
Brussels	49	Boston	37
Paris	53	San Francisco	58

An Art Discovery.—The finding of the arms of the celebrated Venus de Milo has been announced. They were discovered within ten yards of the spot where the torso was unearthed in 1821, on the island of Milo. The American *chargé d'affaires* at Athens, Gen. Meredith Read, says: "The arms are exquisitely modeled. One holds a disk or shield. The workmanship and the locality compel even the skeptical to acknowledge the authenticity of these wonderful relics." The evidence given tends certainly to show the *genuineness* of the relics. A curious coincident occurred with this discovery, in the death of the discoverer of the statue, Col. Voutier, at Hyeres, France. While a midshipman in the French navy, he landed on the island of Milo, and chanced upon a peasant who had dug up the figure and was about to throw it away; but at once perceiving its beauty, interfered, and it was saved. Now, when the arms have come to rejoin their body, the news of Col. Voutier's death reaches Athens.

Kerosene Oil and Illumination.—In a lecture on "Illuminating oils," Mr. R. C. Kedzie, of the Michigan Board of Health, gave the results of his own experiments, in the following language:

"Another fact does not seem to be generally known, although I pointed it out nearly two years ago, viz.: that kerosene rapidly deteriorates by exposure to sunlight. Here are two bottles of kerosene, one clear as water, and the other dark yellow; yet they were filled from the same can of kerosene

and have stood side by side for several weeks; one was exposed to sunlight, while the other was wrapped in paper, impervious to light. In one bottle the sunlight has changed a part of the oil to a tarry substance, which remains dissolved in the oil and colors it yellow, while no such change has taken place in the other. If I add some sulphuric acid to this yellow oil, quite a heavy deposit of tarry matter will form, but none in the other oil. Any kerosene long exposed to sunlight will burn less freely, and all lamps should be kept in a dark closet when not in use. The people also complain because the high-test oil is more costly. Of course, no intelligent man will claim that the remarkable advance in the price of kerosene all over the country during the last year, has any connection with our high test. This is the result of a combination of the principal oil refiners, who control the market. But high-test kerosene, everywhere, costs more than low-test. Gallon for gallon it costs more, but is it therefore more expensive? I was surprised at Grand Traverse to hear that 'the high-test oil not only costs more, but would not burn so long as low-test.' This statement was so opposed to known facts, that I determined to test it accurately. I took two exactly similar lamps, filled one with high and the other with low-test oil; weighed the lamps and oil; lighted them and kept the blaze at equal intensity, and after allowing them to burn side by side for a certain time, I weighed the lamps to find how much oil each had consumed. While the high-test oil had lost four ounces, the low-test had lost five ounces. I have tried the experiment in many ways, both by measuring the amount of oil that was consumed, and by weighing the same, but always with the same result, viz: the low-test oils always burned away faster than the high-test when the light was the same. The low-test oil sells for 28 cents wholesale, and the best high-test for 35 cents (January, 1877)—an increase of one-fourth; but the low-test oil burns away one-fourth faster, so that measured, not by the gallon, but by the amount of light, the high-test is as cheap as the low-test."

Planetary.—Mars will be in opposition this next September, in a position more favorable than will recur before 1892 for discovering the solar parallax. The precision of this method will be comparable with that obtainable in case of a transit of Venus, and the trouble and expense will be vastly less. There will be careful observations in various parts of the world.

Colored Snow.—The somewhat rare phenomenon of a fall of golden yellow snow occurred in the midst of a severe storm on the afternoon of the 27th of February, at Peckeloh, in Germany. A specimen of the water melted from this snow, after being kept a few days, was microscopically examined by Weber, who describes it in Klein's "Wochenschrift;" he found that it contained principally four different kinds of germs or organisms, shaped respectively like arrows, coffee beans, horns, and dark flat discs.

Delicate Thermometer.—A very sensitive thermometer, invented and used for many years by Moritz, has been recently described by him. It consists essentially of a cylindrical band compounded of two strips of platinum and silver soldered together. One end of the band being fastened, the other end is free to move with every change of temperature, and in doing so, moves a mirror mounted upon an axis in such a way as to reflect to the observer's eye the divisions upon a fixed scale, as in magnetic observatories. The instrument, as used by Moritz, may be contained in a box of less than two inches on a side; it can be exposed to the weather if need be, and can, also, be used as a wet bulb thermometer; it appears to be accurate to the fiftieth part of a degree, Fahrenheit.

AGRICULTURAL HINTS.

[The mind is the man. Farming, in the highest sense, is not simply doing the hard work necessary. This can be done by muscle when directed by brains. The true farmer is he who can plan, direct, and control skillfully.]

As this department is one which should contain the most recent gleanings of wisdom and experience, our readers and friends in the rural districts are invited to send us any items of value to agriculturists in general, and which should have a wide circulation. Due credit will, in every case, be given to the contributor.

Mongol Farming.—An English writer who has traveled in Japan and observed the condition of things, thus comments:

"This is the great difference between European and Japanese culture. The former is simply a delusion, which will be detected sooner or later. Japanese cultivation, on the other hand, is actual and genuine; the produce of the land represents, indeed, the interest of the capital of the soil's productive power. As the Japanese knows that he has to live upon that interest, his first care is devoted to keeping the capital intact. He only takes away from his soil with one hand, if he can make up the loss with the other; and he never takes more than he can return. He never endeavors to force the production by large supplies of azotised matters.

"The fields in Japan do not, therefore, as a general rule, present that luxuriant aspect which gratifies our sight occasionally at home. There are no impenetrable forests of straw, from six to eight feet high, to be seen, nor turnips weighing 100 lbs., with 99 lbs. of water in them. There is nothing extravagant in

the sight of Japanese crops. But what distinguishes them most favorably, as compared to ours, is their certainty and uniformity for thousands of years. The real produce of land can be calculated only by the average crops of a long number of years.

"If additional proof were needed to show that the state of cultivation is very superior, and that the land yields abundant produce, I would point to the fact that the Japanese empire, which covers an area similar to Great Britain and Ireland, and of which one-half at the most, from the hilly nature of the country, can be looked upon as fit for tillage, not only contains a larger number of inhabitants than Great Britain and Ireland, but maintains them without any supply of food from other parts. Whilst Great Britain is compelled to import corn from other countries, to the extent of many millions per annum, Japan, since the opening of its ports, actually exports no inconsiderable quantities of food."

A Great Poultry Farm.—Mr. William C. Baker has organized an immense enterprise in poultry raising, at Cresskill, N. J., the cost of which has already reached $75,000, and even at this figure, he makes the business pay him a handsome profit. His chickens are hatched by artificial heat through an incubator of his own construction, the capacity of which is now estimated at one hundred and forty thousand chickens per year, and which the proprietor expects to double during the next few months.

Look out for the Cucumber.—An exchange tells that Dr. Leidy, at a recent meeting of the Academy of Sciences, Philadelphia, announced a discovery likely to startle cucumber eaters. It was to the effect that this vegetable or fruit (which is it?) is liable to be infested with tape-worm. The doctor exhibited a specimen of a tape-worm taken from the inside of a large cucumber. It had all the characteristics of a true tape-worm, but belonged apparently to an unknown species. "The ovaries, containing round, yellow eggs, are confined to the anterior extremity of the segment." That is the scientific account of the peculiarity which distinguishes this kind of tape-worm. Perhaps the peculiarity arises from its having dwelt in the cold heart of a cucumber, instead of the warm stomach of a human being. Very likely these "yellow eggs" hatched inside a man, woman, or child, develop somewhat differently from what they are apt to do inside a cucumber. At any rate, it is not calculated to sharpen the appetite for cucumbers when the possibility is realized of eating along with it the fragments and eggs of tape-worm.

How to raise Fruits—A Friendly CRITICISM.—S. R. WELLS & Co., *New York:* The following is from a source entitling it to notice, and I know of no fitter place for it than the department of your JOURNAL devoted to rural affairs—you being the publishers of the book alluded to.

THOS. GREGG, ESQ.—*Dear Sir:* I have your little book, "How to Raise Fruits," lately so handsomely issued by S. R. Wells & Co., and I need not inform you that I am in entire accord with its aims and purposes, and that I see much in it to commend. And I know you will not object to my stating, in a friendly way, what I conceive to be minor faults. I refer to a certain extravagance of statement, not confined alone to your book, but frequently indulged in by writers on fruit culture. Overestimates of yield are too frequent among writers of your class, and are calculated to create a prejudice in the public mind against the writer and the business of fruit-growing. Your statements of the yield of strawberries, for instance (see pages 137–8), will be regarded as extravagant by many of your readers, and I think it will be only the initiated few who will give them any credence. How many, think you, of those who grow this fruit, are able to obtain half the lowest amount stated? Very few. And I think the number very small, indeed, who approximate those yields. Convince the public that "eighty to one hundred bushels"—or even as many as of corn—can be grown per acre, and my word for it there will be a large increase of strawberry planting.

Again: Is there not also a little extravagance in the cuts representing some of these fruits? for instance, Col. Cheney and Triomphe de Gand (pages 142 and 146). Who ever grew a strawberry as large as the latter? And do not these overdrawn pictures have an effect contrary to that intended?

I make these criticisms not in any spirit of fault-finding, but as a lover of good fruits, and as a convert to the doctrine that fruit-growing and fruit-eating have a decided beneficial effect upon the health of the people. And hoping that the book may have an extensive sale, I subscribe myself, yours, very truly,

A. W. K.

REMARKS.

It may safely be admitted that few Col. Cheneys or Triomphe de Gands reach the size given in the cuts. Yet I have great confidence that those strawberries can be and have been brought to the size represented. They profess to be actual measurements—the first, I believe, as given by its originator at Rochester; the Triomphe de Gand by a propagator not now recollected. They are *not* given as representations of those varieties as grown ordinarily by unskillful cultivators, but as showing their capabilities under the best treatment, and are so generally regarded by the public. These, as well as other varieties, have frequently been shown that measure five, six, and seven inches in circumference. So there is but little exaggeration, if any, in the cuts referred to.

In the matter of yield, there is no overstatement. The figures given are not too large; indeed, they are all below what has

been and can be produced. While perhaps a majority of strawberry-growers do not reach as many bushels per acre as they would of corn, many are the small plats which have yielded, with little extra care, thirty-two quarts, or one bushel, to the square rod. That yield is in no way astonishing, yet it is at the rate of 160 bushels to the acre. Aside from the testimony of others, the writer has in several instances known of yields much in excess of that. And he has this year known a plat of Triomphes to give *more than two bushels* to the square rod, or 320 bushels per acre—it being the fourth year from planting, and its owner had not thought it extraordinary. It is urged that these large yields are rare instances, and usually from small plats of ground. True; but, soil and circumstances being equal, what can be done by one man, can also be done by another; and the proportionate care and labor bestowed on one or five rods will produce equally favorable results if bestowed on 160 or 1,600 rods.

Hence, on a careful review of the subject, and with a sincere desire to avoid all exaggeration and doubtful statement, I am compelled to join issue with my friendly critic, and maintain that what he calls an "extravagance of statement" is not extravagance, but only "words of truth and soberness."

TH. GREGG.

MRS. C. FOWLER WELLS, *Proprietor.*
H. S. DRAYTON, A.M., *Editor.* N. SIZER, *Associate.*

NEW YORK,
AUGUST, 1877.

HO FOR THE COUNTRY!

MIDSUMMER is here in its glory of leaf and flower, and with its heat, and glare, and dust. Our friends of the rural districts at this season are regarded with a feeling akin to envy by those of us who daily tread the streets of the sweltering city, and worry through the long days at the tiresome desk or counter. It was scarcely so a few months ago, however, while the ice-king held us in his rigid grasp, for if, in the course of the winter, our thought was turned toward the country—visions of snow-bound meadows, frozen streams, of leafless trees and a dreary lifelessness pervading the wide expanse—awakened reflections of the comfort and advantage we denizens of town possessed in so rich measure over the husbandman and villager. Here life seemed quickened by the frosty air to an excessive expression, the theaters of business and of social pleasure being filled with a zealous throng; in the country, life, like the streams, seemed to have halted in its course for a period of repose. But now, the country has assumed a phase of superiority, and we feel drawn toward it as toward a place whose scenes and influences will be healthful to the body and refreshing to the mind.

It is a practice which we are far from decrying, that of spending a part of the warm season away from the pent-up city; for some, it is indispensable, if they would be well and perform their allotted work efficiently. For the young, the aged, the sick, and the toil-worn, the change of scene and avocation which a month or so amid the beauties of nature affords, is highly beneficial. We are inclined to think that he who never goes into the country, or does not love its picturesque blending of hill and dale, forest and meadow, is very one-sided in his development. The normal mind finds delight in the dispositions of nature, and tires of artificial surroundings, however splendid may be their design and finish.

The natural only gives complete satisfaction.

Many city people go to sea-side or mountain resorts, where they take rooms in hotels or boarding-houses. Some are rich enough to own a country-seat for summer use. But many visit friends and enjoy themselves at very little pecuniary expense. If the arrangement be mutually agreeable, it is well enough; but cases are easily conceived where midsummer guests are undesirable and hindrances. The farmer, in the midst of his harvest, having need to use every facility he can command to secure the best results of sun and air, and his wife as fully alive to the interests of the hour, and as busily employed as himself, have little or no time to give to visitors, and there can be little hearty enjoyment on either side, unless the visit be very brief. People who "come to stay," in such cases, can scarcely be welcome unless there's a good deal of helpfulness specially suited to the hour in their composition of brain and muscle. There are times when our best friends — those whose society we most desire—would be annoying to us; at such times, however, our best *friends* do not put themselves in the way to embarrass us.

REVIEWERS' PERSISTENCE IN ERROR.

TWO or three writers of eminence have recently contributed papers to leading English publications, in which they have taken occasion to allude to Phrenology with such emphasis that we infer it is active enough in England to arouse anew the fears or prejudices of speculative metaphysicians. In the late number of the *Church Quarterly Review* an elaborate article is published, which discusses the views of Bain, Carpenter, and Maudsley on the relation of mind and body, and sets forth with some definiteness the generally received opinions with regard to the part performed by the brain in the processes of thought and physical function. The whole tenor of the illustrations and proofs adduced by this writer, in support of the premise that the brain is the organ of the mind, is of a piece with that of the early phrenologists, and suggests their recorded observations as the fountain of supply, directly or indirectly. He is borne by them to the irresistible conclusion of the composite structure of the encephalon in correspondence with the composite nature of mind, but, as he is writing for an ecclesiastical organ, he couches that conclusion in careful phrases, viz.:

"In favor of the idea that the different mental powers have each appropriate parts of the cerebral mass as their special organs, may be adduced the analogy of the several physiological actions of various parts of the lower division of the nervous system, now more or less definitively ascertained. For instance, it is now admitted that the movements of the chest in respiration, of the heart in the propulsion of the blood, of the eyes in vision, etc., have not only their special nerves as channels of excitation, but also certain parts of the brain necessarily involved in their play. There is, therefore, an *a priori* probability that to the mental functions, also, certain parts of the brain are specially assigned. Assiduous attempts have been made to determine this point, in the way both of direct experimentation in the lower animals, and of observation of the peculiarities of disposition and character of individuals, in connection with the varied configuration of the brain, as inferred from the external form of the skull—the latter being the basis of the popular system of phrenology."

Then we are told that "but little light has been thrown on the subject by either of these methods."

We might ask, why is the system of Phre-

nology so "popular" if it throws "but little light" on mental character? and why do thousands declare that its teachings have opened to them the true meaning of life and given them success, whereas, notwithstanding the aids furnished by the older philosophies, they had previously entertained but a gloomy forecast. "But little light?" Let the earnest statements of intelligent men and women which come to us daily, prompted only by sentiments of gratitude, answer the aspersion. Here is one just at hand:

"I do not know how I have ever lived to be fifty years old without THE PHRENOLOGICAL JOURNAL. If I could have had it at twenty, and realized its truths as I do now, the remainder of my life would be worth much more to me.—A. G., *Mass.*"

And another:

"Phrenology is to me just what theology is to the man of religion. I live it, breathe it, and work under the strength of its influence. It is that element in my life that feeds the better part of my nature.—W. H., JR., *Mich.*"

The writer in the *Review* is not satisfied with the results of Dr. Ferrier's experiments, yet is candid enough to say:

"It must be allowed that Dr. Ferrier's observations give some support to the phrenologists in locating the reflective faculties in the frontal region."

Phrenology obtains little sympathy from the reviewer on account of his impression of the claims of its advocates, which, we can assure him, is erroneous. The learned representatives of the science do not assert for it the exalted place of "a complete philosophy of mind." They do, however, claim for it a decided superiority over the diversified and indefinite schemes of schoolmen and metaphysicians, and have a solid warrant for their claim in the very satisfactory solution of many questions previously deemed mysterious or unanswerable, and in the valuable uses it subserves in the every-day affairs of man. The simplicity of its definitions, its comprehensiveness, and the sharp distinctions which Phrenology makes between mental faculties, led the learned Whately to declare thus strongly:

"All moral and religious objections against the doctrines of Phrenology are utterly futile."

Robert Hunter, the eminent professor of anatomy in the University of Glasgow, said:

"For more than thirteen years I have paid some attention to Phrenology, and I beg to state, the more deeply I investigate it the more I am convinced of the truth of the science."

From the late Horace Mann's numerous testimonials in its favor we will only quote:

"I declare myself a hundred times more indebted to Phrenology than to all the metaphysical works I ever read."

Thus wrote the venerable author, John Neal:

". . . . The result of all my experience for something over two-score years is this: that Phrenology is a revelation put by God himself within the reach of all His intelligent creation, to be studied and applied in all the relations and in all the business of life."

And the greatest of living pulpit orators gives his testimony in such frank words as these:

"All my life long I have been in the habit of using Phrenology as that which solves the practical phenomena of life. I regard it as far more useful, practical, and sensible than any other system of mental philosophy which has yet been evolved."

The reviewer tells us that a good deal of discredit has been brought upon the system by many of its advocates because of their pandering to "wretched empiricism" and "shallow conceits;" but we have no need to be reminded of this. The very popu-

larity and practical usefulness of phrenological science prompted the fungoid growth of charlatanry which has so retarded its dissemination. But this unfortunate fact does not excuse the spirit of captiousness and rancor which some who style themselves scientists have exhibited toward it. Some have rejected it while recognizing the soundness of principles in mental philosophy and physiology which owe their discovery and application to the early phrenologists.

The writer in the *Church Quarterly* borrows most of his strength, as do all the late opponents of Phrenology, from Dr. W. B. Carpenter, who published a paper about thirty years ago, in which he embodied the results of certain studies in nervous anatomy, and asserted as a conclusion that "the first rudiments of brain found in ascending the animal scale were rudiments of the anterior lobes;" that "the posterior lobes reached their full development in man alone; and hence, that the hypothesis which seated the intellectual qualities in the anterior lobes, the moral qualities in the middle lobes, and the animal propensities in the posterior lobes, was in direct contradiction to the unbroken order of nature."

Now this is the way in which learned men to-day discuss phrenology, taking an old statement of a gentleman, very eminent, to be sure, in his own department, and, without a suspicion of its inaccuracy, building upon it a fabric of reasoning sufficient, of course, to establish their view of the unsoundness of phrenological data. The grand point of attack, their *piece de resistance*, as a Frenchman might say, is Carpenter's *dictum* that we place *the animal propensities in the posterior lobes*. What is the precise extent of the posterior lobes of the human brain? All we can get from Dr. Gray's standard treatise is the somewhat indefinite statement that "the posterior lobe rests upon the tentorium, its extent forward being limited by the anterior margin of the cerebellum," but we find no anatomical division extending upward in correspondence with the anterior margin of the cerebellum; on the contrary, the convolutions are continuous. In fact, the hemispheres of the cerebrum present a general mass indented more or less deeply by the sulci, but being nowhere separable into entire sections. The old division into lobes was for the sake of anatomical convenience; but now, the arbitrary and indefinite nature of such division is decried by Turner, Ecker, and others who favor a division in accordance with the convolutions. The posterior lobe as bounded by Gray, and illustrated on page 558 of his work, is of small extent as compared with the middle lobe, while the "propensities," in their localization according to phrenology, occupy more than one-third of the cerebral mass. These "propensities" embrace faculties relating to the preservation of personal existence, the supply of physical necessities, the maintenance of the family and social relation, and are known by the names Alimentiveness, Acquisitiveness, Combativeness, Cautiousness, Destructiveness, Secretiveness, Vitativeness, Parental Love, Conjugality, Friendship, and Inhabitiveness. Two of these lie in convolutions of the middle cerebral lobe, and considerably in front of the opening of the ear; in fact, in what are termed the anterior-inferior convolutions. Destructiveness lies immediately over the auditory process, in the middle lobe, while Secretiveness and Cautiousness lie above Destructiveness in the medio-posterior part of the middle lobe, or in what is defined by Prof. Turner, the Scottish anatomist, as the parietal lobe. Taking the parieto-occipital fissure as the anterior boundary of the occipital or posterior lobe,

which is accepted by the latest authorities like Gratiolet, Turner, and Ecker, we find that lobe to be of very small extent, its gyri barely accommodating the organs Parental Love and Inhabitiveness, so that Combativeness and Friendship must be lodged in the middle lobe.

Thus upon the ground of the non-phrenologists, and using their own map of the brain, their assignment of the "propensities" to the posterior lobes is seen to be altogether inconsistent, and one can scarcely avoid the inference that the learned writers who speak of Dr. Carpenter as having "crumbled the whole fabric of Phrenology into dust," are eminently ignorant of the true anatomical features of the system.

In another number we shall take occasion to consider the other matter of objection on the part of these learned critics, viz.: that "the first rudiments of brain found in ascending the animal scale were rudiments of the anterior lobes."

GREAT FIRES.

THOSE were terrible fires—that of St. John, N. B., which on the 20th of June destroyed almost the entire business part of the city, and turned into the streets upward of twelve thousand people, and that of Marblehead, Mass., which broke out on the 25th of the same month and burned over twelve acres before its progress was checked. But while the ashes are still hot and smoking, the work of clearing away the *débris* is begun, and the cheering sound of the saw, hammer, and trowel is heard, intimating that ere long the black scars of devastation will be covered, and a new and better order replace the old buildings. How elastic is the human spirit! How quickly its energy triumphs over misfortunes which affect the material interests of society! Witness the mighty sequel of the Chicago conflagration. The people of St. John and of Marblehead will not do less in their several places.

But there is a fire which is more terrible in its devastation than such as the above. It deprives its victims not only of their property, but it destroys them also. Its ravages consume their health, strength, hope, and life. To-day the thousands of St. John are housed, clothed, and comfortable, who were yesterday homeless and destitute, but the hundreds of thousands who are consumed by the fire of rum, lose all that belongs to home, comfort, and happiness; and most of them are crushed down in wretchedness unspeakable.

Lately, there was much talk concerning the suppression of the sale of that boys Fourth of July delight, the Chinese fire-cracker, on the ground of its dangerous character, it having been the cause of many serious conflagrations—that of Portland, for instance, a few years ago. Men of wealth and influence have argued strongly against fireworks in general, as agents of extravagance and destruction, with scarcely a single true element which might be deemed favorable to their use by reason and the moral sense. These fiery things, we are told, have burned up millions of dollars worth of property, the fruit of years of thought and toil. Society would be so much the richer if they had never been known, and hundreds of precious lives, too, would have been saved. Yes, we agree to this, but we can not help thinking of that other "fiery thing" against which these men of wealth and influence do not argue so strongly, but which causes a hundred, yes, a thousand times more material and moral damage than fire-crackers and other pyrotechnics. Will these gentlemen tell us in how many instances the fire-cracker, or Roman-candle, or rocket, which fired a building, was set off by a hand whose

carelessness was occasioned by "fire-water?" They know, however, that a large proportion of the fires which occur in the course of a year are due to drunkenness. Why, then, do they not urge the immediate suppression of the trade which supplies broadcast the liquid enemy to clear heads and steady hands?

Only do this, gentlemen, and insurance interests, now so weak, will at once strengthen, and lower rates of premium become practicable.

HOW TO OBTAIN READING-MATTER.

IT has been proposed, by some of our earnest advocates of Christian missionary enterprise, as a method by which the agriculturist might contribute to the cause of morality and religion, and not feel it as a severe tax upon his income, that a certain area of land be set apart and cultivated, and whatever was the product, it should be given to the mission fund. This idea has also been approved, by a contemporary of the press, as applicable to one's personal need of mental improvement; that one whose means are restricted—if a farmer, gardener, stock-raiser, or dairyman—could, from year to year, set apart the results of the tillage of a plot of land, or a certain part of the proceeds derivable from the sale of an ox or of the milk of a cow, for the purchase of desirable reading-matter.

The reader may remember the story of the farmer who complained that he could not renew his subscription for his favorite weekly newspaper, and who was requested by the editor to send him, in lieu of money, the eggs laid by one hen in the course of the year. The farmer, pleased by so easy a mode of settling the account, selected a hen and faithfully carried her eggs, from month to month, to the editor, who, at the year's end, surprised the farmer by exhibiting to him an account in which there was a balance in the hen's favor.

Some of the subscribers to THE PHRENOLOGICAL have resorted to measures quite desperate to continue their subscription. One even sold her hair to obtain the money for the subscription and a copy of "New Physiognomy." She was *determined* to have them!

How many of our Western friends could easily devote an acre of land to literature, the twenty or thirty bushels of grain from which would add several choice volumes to their book-shelf! Rich compensation for a few days' labor! And this book-acre could be made a regular adjunct of each year's work, its outcome successively adding to the home collection of valuable reading. We are quite sure that once fairly tried, the plan would not be lightly relinquished, or the acre for home-reading be gingerly tilled.

THE FRENCH EXPOSITION. — Preparations are now under way for the Paris Exposition of 1878. An invitation has been received by the United States Government to participate, and President Hayes is expected to appoint the commission soon, which will proceed to Paris and arrange for the exhibit from this country. The President will make this step with the expectation that Congress will make an appropriation next fall to meet the expenses. The name of General Hawley has been prominently mentioned in connection with the chairmanship of the commission which the President will probably name, and his selection for this position was considered as almost certain by prominent merchants in this city.

Our Mentorial Bureau.

[In this Department will be noticed such matters as are of interest to correspondents and to the general reader Contributions for "What They Say" should be brief, pointed, and creamy, to secure publication.]

To Our Correspondents.

QUESTIONS OF "GENERAL INTEREST" ONLY *will be answered in this department. But one question at a time, and that clearly stated, must be propounded, if a correspondent shall expect us to give him the benefit of an early consideration.*

IF AN INQUIRY FAIL TO RECEIVE ATTENTION *within two months, the correspondent should repeat it; if not then published, the inquirer may conclude that an answer is withheld, for good reasons, by the editor.*

WE CANNOT UNDERTAKE TO RETURN UNAVAILABLE *contributions unless the necessary postage is provided by the writers. In all cases, persons who communicate with us through the post-office should, if they expect a reply, inclose the return postage—stamps being preferred. Anonymous letters will not be considered.*

WOMAN'S READING CLUB.—In answer to further inquiries on this subject, we would say that Miss Anna E. Ticknor, No. 9 Park St., Boston, Mass., is Secretary of the New England Woman's Club, whose headquarters are in Boston.

SLEEPINESS.—"I believe it is a general habit with people during the summer season, to complain of being sleepy. I know it is true with me. You will do me a favor by telling how I can keep from being so sleepy during the day when I should be studying."—W. H. S.

Most people suffer from lassitude, depression, and drowsiness during the early summer for the reason that their systems have become pervaded with carbonaceous matter owing to their habit of eating food which contains such matter in excess, and not appreciating the necessity of modifying their diet in accordance with the progress of the seasons. Food with warming elements is requisite, of course, in the winter, but in warm weather, food which is rich in nutrient qualities, but not having a very large proportion of carbon, is desirable. A torpid liver induces a sluggishness of the circulation, which in its turn retards the functional activities of the nervous system. Hence the disposition to languor and sleepiness. You should eat fruit liberally; it assists the depurating organs in relieving the system of the surcharge of carbon, and so refreshes the nervous functions. Be active, a good deal out of doors, but do not get into the habit of lounging and lolling about; be brisk, free in movement, and you may thus stir up a general activity of the system.

LISPING.—G. K. M. E.—This habit is frequently due to the encouragement which some people have had when very young to indulge in infantile phraseology. Some mothers are indiscreet enough to be profuse in what is known as "baby talk," and their children until pretty well grown suffer in this way from such teaching. It may be due, also, to physical conditions—the formation of the tongue or lips. Effort, however, we are inclined to believe, will prove remedial, just as care will relieve, to a considerable degree, the habit of stammering.

DEAFNESS.—R. A. L.—The infirmity having been occasioned by disease in this case, we are of opinion that little can be done toward its cure. The girl should be examined by an experienced aurist.

WRINKLES.—C. C. N.—Wrinkles of the kind described as "running from the outer corner of the eyes toward the organ of Acquisitiveness" are said, by physiognomists, to indicate a tendency in the character toward uprightness, honesty, and probity. If their direction in your case is toward the organ of Acquisitiveness, it might be inferred that in your pecuniary dealings you show a straightforward, honest method. You ought, at any rate, to confirm this indication.

CULTIVATION OF LANGUAGE, EVENTUALITY, CAUSALITY, ETC.—F. J. B.—The development of these faculties to a degree indicated by 5 in your chart is a good basis for their cultivation. By reading the works of the first writers, and not only reading, but carefully studying their methods and forms of expression, and also the arguments, you may in time improve yourself very considerably. To be a good speaker, practice is necessary. We have known persons who, in the start, were scarcely able to frame a correct sentence when before an audience, but who by effort and study became really attractive as speakers. It is essential, however, that one should have something to speak about, and be well informed upon it.

HEAD ONE-SIDED.—S. N.—We rarely find a head which is evenly developed on both sides. Of course there are approximations to symmetry of growth, and for that reason as a general thing irregularity in the proportions of the head is not observable except by experienced ob-

servers and phrenologists. The left side or hemisphere of the brain is generally the larger, for the reason that it is exercised more than the right side, it having special relation to the right side of the body, which is the larger, as everybody knows. In your case the marked disparity is probably due to imperfect nutrition while you were an infant, and it may be that now you do not live quite up to the mark of perfect physical sustenance. You may be troubled with some form of dyspepsia, which prevents the complete assimilation of your food, so that your brain and nervous system still suffer from a want of due support. You should see to it that your food possesses all the essential qualities of nutrition. And you should also see to it that you have an abundance of sleep. Avoid excitement as much as you can, and do not allow your apparent infirmity to prey upon your mind and render you downcast and despondent.

NOSE-BLEED.—L. T.—Bleeding at the nose may be occasioned by several causes: an abnormal condition of the nasal veins, a determination of blood to the head because of constitutional diathesis or improper habits of diet and life, or there may be a derangement of the circulation. Of course this bleeding is injurious, like everything which is abnormal in the bodily economy. Avoid all stimulating foods and drinks; do not touch coffee, wine, spices, or food with excessive heating elements in its composition. It would be well to refer the case to some experienced physician or surgeon.

SICK BABY.—You can, of course, do something toward relieving the trouble of your little boy by carefully ordering his food. We would not give so small a child flesh meat, but milk, bread, oatmeal, and fruit; the latter, mildly tart, is desirable on account of his nervous excitability. As the trouble is a constitutional one, much care must be exercised so as not to increase the inflammatory condition. The stomach should not be loaded or urged. It were better to give him a tablespoonful of food twenty or thirty times a day at regular intervals than to crowd him at three or four meals. A thick tea made of gum-arabic would be found nourishing and soothing to his irritable stomach. A spoonful of this given occasionally will prove a good substitute for other foods.

SPIRITUALITY AND SPIRITUALISM.—Spirituality is not always large in spiritualists, but generally it is. There are some who are earnest in their advocacy of the doctrines taught by spiritualism who have been won over to them by argument and observation. Some have given in their adhesion through curiosity.

BLOOD-DRINKING.—We can not recommend blood as an article of diet. We are disposed to consider it poisonous, on account of the chemical changes it undergoes very soon after being shed.

NATIONALITY IN HANDWRITING.—We have found in our experience that nationality has something to do with one's handwriting. We can usually detect the Frenchman, or the German, or the Englishman by his handwriting. We can not say that we are equally clear with respect to the chirography of the universal Yankee. He seems to be cosmopolitan as a scribbler.

GEORGE ELIOT.—A. T.—We contemplate publishing a biographical review of this distinguished lady at no distant day.

KNICKERBOCKER CLUB.—S. B.—You will find a sketch of Plato in the November number of the PHRENOLOGICAL for 1876. It is entitled "Paul and Plato." The points will probably cover your wishes with regard to the distinguished Greek philosopher.

What They Say.

WHAT HE THINKS.—A correspondent having met with one leaf of the PHRENOLOGICAL JOURNAL, thus writes:

"From that leaf I got the impression that you think that people can avoid disease if they only live right. If this is your idea, and the opinion is right, then we have lots of folks around our district who are living terribly wrong, for there is hardly a member of any family who is not troubled with ague, either the dumb or the shaking sort. They get first one doctor and then another, but all to no purpose. Some of the families have spent at least one-quarter of the father's earnings—which is not much nowadays, for we are a poor people—on medicine and the doctors. The doctors, too, never say anything about our way of living; do not act as if they thought it mattered much how people lived. I intend to bring this publication of yours to the attention of our folks at home, and see if we can learn anything from it. If the language is not too big, I guess we can."

Our correspondent will find that the language is not "too big" for the use of his friends. Our aim is to make the advice we have to give entirely clear and simple, so that there shall be no difficulty in following our suggestions with regard to every-day life.

HAPPINESS IN ADAPTATION.—A friend sends us the following extract from a sermon in the *New Jerusalem Messenger* of Jan. 24, 1877:

"To be truly blessed is to have that to do for which our organization fits us, for which we are

made, or for which our faculties are so adapted that we can love to do it. For this is Heaven; and there is no higher, no other heaven. *The greatest blessing that we can possibly confer upon another, is to help him to see, and to lead him to love to perform the use for which he is adapted.*

"To try to do that for which we are not adapted, is like the eyes trying to hear, or the ear to see. It is vain to hope for real honor, or for real enjoyment, in any other sphere than that for which we are created. The capabilities of the hand are various; but can it perform the offices of the foot, or the foot those of the hand? And could the foot be as much honored in any other sphere as in its use as a foot? Society is, in its offices, a man; is in the human form; and we are the parts—the different organs and members. And our relative position is fixed by the peculiar form and character of our organization," etc.

FUNCTION OF THE SPLEEN.—*Editor of the* PHRENOLOGICAL JOURNAL—*Dear Sir:* At your suggestion I present an abstract of my observations on the spleen, with an inquiry into its functions. Many years ago I mentally asked this question: "Is the spleen the negative pole of the brain, for the circulation of its animal magnetism?" Now, in affirmation, I offer the following points:

1st. It is necessary to fulfill the laws of our being, which are in harmony with all external nature. 2d. It is needed to relieve the surcharged brain of its burden when unduly excited through nervous excitability or excessive mental exertion. 3d. It is (or assumed to be) the seat of our emotions, and hence bears particular relation to intuition. It often saves the brain from vertigo, apoplexy, palsy, or softening. It furnishes a seat for those internal monitions which have ever been considered as the essence, test, and ultimate of all true religious ideas, thoughts, or system. Here they are conceived, and thence sent to the spinal cord and the brain for growth, maturity, and expression. The nerves are but conductors of animal electricity, or magnetism, and also serve as the telegraph wires of our finest thoughts and purest sensibilities. Take nothing on trust, but look into your own beings, and then consult the records of antiquity, and the decisions of modern science. I but repeat the lessons of the past, and the results of patient, toiling science.

I commence with a description of the nervous system, as stated by Huff, in his "Electro-Physiology:" "The nervous system consists of two constituent portions—the *cerebro-spinal*, which embraces the brain and the spinal cord with the nerves given off from them; and the *sympathetic*, or *ganglionic*, which consists of ganglia located on each side of the spine, together with the nerves proceeding from them. The brain and spinal marrow constitute the great nervous center, while the sympathetic system embraces a series of nervous centers, wherein each separate ganglion seems to possess the power of generating nervous influence. The former has been called the nervous system of animal life, and the latter that of organic life."

"The nervous tissues are vesicular and fibrous; both essential to the nervous system. The *vesicular*, composed of vessels, or little globular cells, of a reddish gray color, composed of moderately thick capsules, containing a soft, granular pulp." "The vesicular structure collected in masses united with the fibrous structure as in the brain, spinal cord, and the several ganglia." "These masses constitute the so-called *nervous centers*, that is, the organs in which nervous force is supposed to be generated."

"The fibrous nervous system consists of minute fibers and communicate the nerve force to the different nervous centers, and thence, like telegraph wires to different parts of the body." I have had to abridge very much, but each one will remember that the brain is, according to physiologists, but an enlarged ganglion (and the presiding one). I will now make other extracts to show the organization of the spleen. Muller says: "The spleen is invested by a strong plexus membrane, which sends numerous band-like processes into its interior so as to support the soft, pulpy, red tissue of the organ." Duypuytren says: "The capsules of the human spleen are assident, as grayish bodies, devoid of internal cavities, and so soft as to take the liquid form on the knife." Nikel describes them as "roundish, whitish bodies, most probably hollow, at all events very vascular." Paxton says: "It contains a number of soft, grayish, semi-transparent granulations, disseminated irregularly in its tissue; their nature unknown." I have sketched these two sets of organs in the fewest words possible, while showing the similarity of bodies in the structure of each, and peculiar to them alone. Every one can see at a glance how similar are the words used to describe both the brain and the spleen. Dalton says: "The splenic pulp is a soft, reddish substance, a few nerves, and lymphatic, capillary blood-vessels in great profusion; and certain whitish, globular bodies, regarded as distinguishing anatomical elements of the organs called malposition bodies of the spleen." "These are very abundant, and scattered about the *pulp*." I could trace analogy in the anatomy, between the brain and the spleen, if space permitted. The sympathetic nerves do not start from the cerebro-spinal nerves, but pass from the sympathetic to the cerebral; thus forming a complete chain for the current of the surplus magnetism.

The spleen shrinks when under the influence of strychnine, camphor, muriate of morphine, etc., showing its complete sympathy with the

brain (see Muller). The post-mortem examination of Vice-President Wilson, who died of apoplexy (induced, no doubt, by long and severe mental labor), showed an enlargement and redness of the spleen; while the brain, as described by the papers, was the seat of congestion, indicated no effusion of blood; thus showing, I think, that the spleen received the shock in life's struggle against death. I have conversed with a great many people, some strong-minded men and many women, who have told me that when they suffered headache from nervous prostration or mental trouble, they always felt a sinking pain below their diaphragms, and always on the left side. I knew one man especially, of a strong physical system, and of a vigorous mind, who always suffered in that locality when severely taxed mentally in the conduct of his business. He was a large and thrifty manufacturer, and finally died from dropsy of the chest in two months after the attack, or in less than six weeks after his malady was understood by his physician, a very skillful one. He had two in attendance, but one thought the heart was the organ first affected, while the other thought it was the kidneys. I was at his house during the whole time, and watched his symptoms, and kept his case daily recorded, and then believed, as I do to-day, that his spleen was the first to respond to the overtaxed brain.

What organs in the human body are described as being formed in considerable part of pulp, save the brain, spinal cord, ganglia, and the spleen? When the world thought that the seat of the soul was in the bowels, they were referred to as the seat of mental suffering; but when people had raised their ideal mental seat to the heart, then that was appealed to for consolation, or denounced for bringing pain, or as being "deceitful, and desperately wicked;" and a good part of this character it innocently sustains to-day. Yours,

M. WINCHESTER HAMMOND.

Frankford, Philadelphia.

AN IMPROVEMENT IN NAVAL ARCHITECTURE.—A correspondent and friend writes us to the following effect: "It is usually supposed that an inventor will secure patents for the devices if they be of economic value; but that need not be the invariable sequence. It is quite possible to possess large mechanical ability combined with benevolence. In which case the inventor might turn all the powers of the mind in the direction of the amelioration of the condition of humanity in general. This, we believe, is the case with the inventor of a new model and propeller for sea-going craft, which may be described briefly as follows: Taking the experience of the past in naval architecture—depth of draft involves great pressure on side and bottom; which, of course, is friction and consequent retardation. The model chosen to obviate this, and at the same time secure stability, speed, security, and less lateral motion than at present, may be designated in the general term of saucer-shape, with modification of bow and stern. The propeller is a curious, yet simple combination of the screw and oars, so arranged as to give the blades a greater or less angle of dip, as the speed is increased or decreased; enabling the utilization of power and speed of motion in such way as to make it practicable to obtain greater economy of time and fuel in ocean transit. Estimates by competent engineers place the reduction of cost and time at one-third to one-half under the present average, by these improvements. In a purely humane point of view, anything that will tend to make the necessaries of life as nearly costless as may be in the nature of their production and transmission is a boon. For a humane philosophy concedes the fact that bread and raiment are as needful to life as air and water. Moreover, we will go a step farther and state a concession that has been wrung from the reluctant wrestlers for power and place, which is, that any knowledge which enables people to avoid disorders of every name and nature, should be freely transmitted everywhere. As the invention alluded to helps to this end, it may be adopted, notwithstanding the opposition of existing monopolies. The inventor, a thorough and practical mechanic, is in readiness to proceed to any well-appointed ship-building locality, and with the co-operation of a competent naval architect, elaborate the plans and apply them to practical use. FREDERICK M. SHAW."

Los Angeles, Cal.

WISDOM.

"Think truly, and thy thought
Shall be a fruitful seed."

MANY a man has ruined his eyesight by sitting in a bar-room looking for work.

THE pleasure of doing good is the only one that does not wear out.

MEANIN' goes but little way i' most things, for you may mean to stick things together and your glue may be bad, and then where are you?

THOUGH a task of pleasure may quicken the relish of life, an unrestrained indulgence leads to inevitable destruction.

IT is the mind that makes us rich and happy in what condition soever we are, and money signifies no more to it than it does to the gods.

A SAILOR, who jumped overboard to save another, was asked if he was fit to die. "I could not be made more fit," he replied, "by declining to do my duty."—ERSKINE.

Library.

In this department we give short reviews of such NEW BOOKS *as publishers see fit to send us. In these reviews we seek to treat author and publisher satisfactorily and justly, and also to furnish our readers with such information as shall enable them to form an opinion of the desirability of any particular volume for personal use. It is our wish to notice the better class of books issuing from the press, and we invite publishers to favor us with their recent publications, especially those related in any way to mental or physiological science.*

STRUGGLING UP TO THE LIGHT; the Story of a Woman's Life. By Bella French, editor "American Sketch Book." 12mo, pp. 221. Chicago: W. B. Keen, Cook & Co.

An author not without many antecedents—of a character pretty well known in the West—has sent forth this book. The story relates that Mrs. Bright had been born a poet in temperament and yearning, was married while yet a child, and at a comparative early age was the mother of a large family. Her husband was of that average, or lower than average, class of men who pursue a routine manner of life, drink a little, chew and smoke a little, and occasionally are given to an indulgence in language not particularly refined, and hence it can not be wondered that Mrs. Bright's poetic nature, when she had awakened to a realization of the alliance for life which she had formed, felt hampered, hindered, and degraded. No wonder that under the influence of this poetic nature, with its yearnings and longings, with its lost opportunities and mistakes, with its dreams and reveries bringing to the mind's eye "what might have been," led her to become "cross, fretful, and impatient of her lowly life." One of her children, born while she indulged this mental disposition, inherited many of her qualities, particularly her earnest, yearning spirit, is the chief subject of the book. She—Martha Bright—it is who makes the struggle toward the light. Many vicissitudes are hers—an unhappy marriage, an escape from its thrall, a laborious career, with now and then a gleam of sunlight—out into the world, away from home and friends, at one time sinking under hardship so deeply that she determined upon suicide, but was rescued from her mad purpose by a stranger-hand, who proves the good angel helping her out of the slough of despond into which she had fallen, and inspiring her with fresh courage. In the course of her struggles she finds opportunities to visit foreign lands, and drinks deep draughts of instruction and inspiration from the scenes of history and poetry so thickly clustered in sunny Italy and France. Mrs. French makes no effort at fine writing; the talk of her characters is of the every-day sort, and so, too, her incidents partake of the very prosaic character of every-day life. One is impressed while reading the story that she has put a good deal of herself into it. As we glance through the concluding chapter we feel a tinge of disappointment. The "Light" does not appear to us to have been reached yet. There is an abruptness in the termination of the recital which leaves us in doubt of Martha's final success. Perhaps we are to await a sequel.

AN AUTOBIOGRAPHY OF THE REV. JOSIAH HENSON, the Hero of "Uncle Tom's Cabin." Edited by John Lobb.

Mr. Henson's story of his Life, published at the office of *The Christian Age*, London, England, represents a life of vicissitudes, from 1789 to 1876. He says he was in the vicinity of Andover, where Mrs. Stowe resided, and narrated to her the details of his life, and told her about the peculiarities of many slave-holders and the slaves in the region where he had lived forty years, and it was on that report that she built up her character of "Uncle Tom." This feature of the book is sufficient to render it interesting to the general reader.

ALCOHOL; AS A FOOD AND MEDICINE. A Paper from the Transactions of the International Medical Congress, at Philadelphia, September, 1876. By Ezra M. Hunt, A.M., M.D. 12mo, cloth, 60 cents. New York: National Temperance Society and Publication House.

The Centennial Exposition at Philadelphia last year was made the occasion or opportunity of several important conventions by learned, religious, and philanthropic societies. Among these the International Medical Congress of September holds a leading place. It is, of course, unnecessary to remind the reader that this Congress was attended by many of the most eminent medicists and sanitary reformers of the time, and all classes of questions bearing on public and private health were discussed. The numerous phases of the alcohol question were treated with candor and fullness, and the leaning of the majority was toward the non-food side.

The elaborate paper, as above entitled, which was presented by Dr. Hunt, who occupies the important place of President of the Section of the American Medical Association on State Medicine and Public Hygiene, comes to us in a neat and attractive dress. As a comprehensive review of the opinions of the best scientific observers on the nature and therapeutic properties of alcohol, it has no superior among late publications. As an aid to the dissemination of substantial information on a matter of such capital importance to the public as the use of alcoholic beverages, the volume should have the support of all who are interested in social reform, and its teachings should be disseminated thoroughly among the people.

MOODY'S TALKS ON TEMPERANCE, with Anecdotes and Incidents in connection with the Temperance Work in Boston. Compiled and edited by Rev. James B. Dunn. 12mo, cloth, pp. 248. Price $1.00. New York: National Temperance Society and Publication House.

Messrs. Moody and Sankey, in their course of Christian evangelization, could not hope to cover the field of moral and religious endeavor without having much to say on the great evil of civilization—alcoholism. Had all their energies thus far been devoted to stem the tide of intemperance and save its victims, we are inclined to think that their moral effect would have been even greater in practical results than appears from their chosen line of operation. However, as a supplementary work of the revivalists, it has been productive of great good. The present volume illustrates Mr. Moody's power as an advocate of Temperance, and it may be circulated with confidence among the drinking classes as an instrumentality for reform at once persuasive and interesting.

A good portrait of Mr. Moody, and a fine engraving of the Tabernacle in Boston, [illegible]m a part of the neatly-printed book.

THE WORLD OF SONG: A Collection of Popular Songs, Ballads, and Duets, with an Accompaniment for the Piano-forte or Reed Organ. Folio, pp. 248. Boston: Oliver Ditson & Co.

This compilation numbers upward of one hundred subjects, many of them sweet songs, which won the approval of musical people on their first appearance, and which shall long maintain a prominent place in their opinion and practice. To mention a few of them, viz.: "Angels whisper Sweet Good-night," "Carry me back to Tennessee," "The Heart Bowed Down," "The Rock Beside the Sea," "Sweet By-and-By." There is variety enough in the list for all tastes—we mean refined tastes—humorous and jocular compositions, as well as grave and severely sentimental. Of the latter sort the publishers have wisely inserted but a few. The book is admirably fitted for the use of the family and social circle; furnishing much that may serve as food for loving swain and tender maiden or for the delectation of the evening party.

"EASTWARD HO!" or, Leaves from the Diary of a Centennial Pilgrim. A new book from a new author. Being a Truthful Account of a Trip to the Centennial City via Washington, and Return via Niagara Falls, with a Graphic Description of the Exhibition itself. Price 75 cents. By David Bailey, teacher, of Highland, Ohio.

The title describes this unambitious effort of a young Western teacher to record his impressions of the great show. By those who are numbered among his friends, and who know how much of mental improvement it evidences, the volume is approved. In his "dedication" the author uses peculiar phraseology, viz.: "In the hope that she (his former teacher) will remember his errors as a pupil," etc. Generally, people are desirous that their errors shall be forgotten. But Mr. Bailey meant to convey a different sense from that in which most of his readers are likely to take his statement.

PLAIN FACTS ABOUT SEXUAL LIFE. By J. H. Kellogg, M.D., editor of *The Health Reformer*, etc. 12mo, cloth, pp. 356. Price $1.50. *Health Reformer* office, Battle Creek, Mich.

The author may well say that "books without number have been written upon the subject" which he has chosen, but he aims to treat it in a more practical and instructive manner than is the case usually. Most of books relating to this most important domain of our physical life are advertising traps set by unscrupulous quacks who have some villainous compound which they would sell at the cost of the health and pockets of the public. And such publications are not only inaccurate in their expositions of physiology and pathology, but also meretricious and baneful in their influence upon the minds of readers. The few really good treatises adapted to general use have suffered much from the odium created by these vile agents of the nostrum venders, and nowadays the learned physiologist is rare who is sufficiently interested in social and domestic reform to venture to instruct the people with regard to sexual matters and to brave public sentiment. Dr. Kellogg views the generative function in man from the point of view of physiology and as a fact in natural history, avoiding phraseology and allusions which would suggest improper lines of thought. At the same time his language is plain and definite. A hygeio-therapeutist, his advice with reference to the prevention and treatment of disorders generally obtains our approbation. Several recipes for the preparation of food adapted to the use of morbid invalidism, and hints on methods of bathing, render the appendix of special value.

THE WONDERS OF PRAYER. A remarkable record of well-authenticated Answers to Prayer. By Henry T. Williams. 12mo, cloth, pp. 408. Price $1.50. New York: H. T. Williams, publisher.

The editor in his introductory remarks states that the several hundred incidents published in this volume "are vouched for upon the strongest proofs of authenticity possible to obtain, and are either of circumstances known amid my own experience or connected with the lives of my correspondents and their friends." Among the contributors are such well-known persons as D. L. Moody, Chas. Spurgeon, Drs. Hatfield, Patton, Prime, Finney, Cleaveland, and Waterbury. As a compilation of facts the volume certainly offers the most practical kind of encouragement which a Christian could ask for toward the maintenance of his faith.

PUBLICATIONS RECEIVED.

STATE REGULATION OF VICE.—A paper read at a Conference invited by the "New York Committee for the Prevention of Licensed Prostitution" held in the parlors of the "Isaac T. Hopper Home," April 26th, 1877. By A. M. Powell. New York: No. 58 Reade St. Price 15 cents.

CATALOGUE (Twelfth Annual) of the Officers and Students of Vassar College, Poughkeepsie, N. Y., for 1876–77.

FRANK LESLIE'S SUNDAY MAGAZINE. This is a new candidate for the favor of religious people, from the press of a house whose numerous periodicals have savored of very secular character. Rev. Dr. C. F. Deems is editor. Price, $2.50 per annum. A considerable amount of reading for the money.

THE WOMAN'S TEMPERANCE UNION, the organ of the National Union, has made another advance. It has contracted its name to *Our Union*, donned a new and very attractive dress, increased its size and the number of its pages, and given a chair to a new editor, Miss M. E. Winslow, favorably known as a writer for some of our leading religious weeklies. She seems to be doing her work with vigor and efficiency, sustained by an able corps of writers. A marked feature is the space given to the juvenile work, regular lessons appearing in each number, in some of which the scientific aspects of temperance are effectively and attractively presented. This is a department of the work which will both please and assist Mr. Blair in his noble work for the coming generations.

FLORIDA AS A PERMANENT HOME: emoracing a Description of the Climate, Soil, and Productions of the State, together with hints to newcomers and prospective settlers on the choice of location, cost of labor and lumber, expense of living, how and where to build, what crops to plant, how to avoid sickness, etc. By D. H. Jacques. A well-printed pamphlet, full of trustworthy information, prepared by a gentleman who is personally acquainted with Florida matters, literary and horticultural. The price is but ten cents.

THE FIRST STENOGRAPHIC TEACHER, a Guide to the Reporting Style of the Art of Stenography. John Brown Smith, Author and Publisher. Amherst, Mass., U. S. Price 25 cents. A brief examination of Mr. Brown Smith's system impresses us that it will not be likely to supersede methods now in use. We can not perceive the gain or advantage to be derived by adopting it in preference to the Pitman Phonography.

THE QUARTERLY JOURNAL OF INEBRIETY. No. 2 of the first volume contains much interesting matter related to the habit of drunkenness, and many valuable principles, which our friends who are interested in Temperance reform could utilize. This is the official organ of the American Association for the Cure of Inebriates.

FOURTH ANNUAL REPORT of the Secretary of the State Board of Health of the State of Michigan, for the year ending September 30, 1876. A voluminous document, and valuable to sanitary science, because of the fullness and orderly presentation of its data. Office of the Secretary, Lansing, Mich.

REPORT OF THE MANAGERS of the State Asylum for the Insane, at Morristown, N. J. This neat document contains valuable suggestions concerning the treatment of lunatics, as might be expected from so skillful a superintendent as Dr. Buttolph.

NEW MUSIC.—Peters' Household Melodies, a collection of Songs, Duets, Choruses, etc. Each No. contains several songs by most popular composers, with full-sized music. Price, 25 cents. J. L. Peters, New York.

DITSON'S MUSICAL MONTHLY. A Collection of Popular, Vocal, and Instrumental Music. Nos. 1 and 2 contain each half a dozen new compositions by leading musicians. Price only 25 cts. Ditson & Co., Boston, etc., Publishers.

ILLUMINATING OILS IN MICHIGAN. A Lecture delivered before the Legislature. By R. C. Kedzie, of the State Board of Health. An effort replete with practical information on an important topic.

THE WESTERN REVIEW of Science and Industry. Edited by Theo. S. Case. An enterprising publication from the far West. The contents and neat typography promise well. It deserves support.

IN MEMORIAM: George Dawson. Six of his Sermons, and several Prayers. An appreciative sketch of an earnest minister and noble man, whose recent death has occasioned no little grief in Birmingham, Eng.

SYLLABUS OF A COURSE OF LECTURES on American Pre-historic Archæology, before the College of Fine Arts. Spring Term, 1877. By Wills De Hass, M.D.

UPON THE SITUATION: A consideration of the evils, social and political, with suggestions for their correction. Tuscaloosa, Ala.: S. D. J. Moore.

THE AMERICAN MILLER, of Chicago, begins its fifth volume with a good appearance of enterprise and support. Price $1 per annum.

ODD FELLOWS' DIRECTORY of Philadelphia, for term ending October, 1876. Price, five cents. Philadelphia: C. K. & W. D. Hammitt.

THE PEOPLE'S PULPIT: Containing Sermons by Stephen H. Tyng, Jr., D.D. Issued in parts. Price 25 cents.

THE RIGHTS AND DUTIES OF TOWNSHIP OFFICERS. By W. R. Bierly, of the Williamsport Bar, Williamsport, Pa.

Just Published, and Given Away.

A NEW BOOK FOR PARENTS AND TEACHERS.

HOW TO TEACH

ACCORDING TO

TEMPERAMENT AND MENTAL DEVELOPMENT;

OR,

PHRENOLOGY

IN THE

SCHOOL-ROOM AND THE FAMILY.

WITH MANY ILLUSTRATIONS.

By NELSON SIZER, *Author of "Choice of Pursuits;" "Domestic Life;" Associate Editor of the Phrenological Journal, etc.* Extra cloth, $1.50.

S. R. WELLS & CO., PUBLISHERS, 737 BROADWAY, NEW YORK.

One of the greatest difficulties in the training of Children which Parents and Teachers have to overcome is not understanding their Temperament and Disposition. This work will aid in this direction more than has ever been done in any other way. It points out clearly the constitutional differences, and how to make the most of each. The following from the contents will show something of the nature and scope of this work.

CONTENTS.

How to Teach; Temperament, its Relation to Health and Culture—Motive Temperament, Vital Temperament, Mental Temperament, Harmony of Temperament; Laws of Health Applied to Education; Intellect Threefold; Individuality; Education Complicated; Disposition to be Educated; Combativeness and Destructiveness; Form; The Law of Magnitude—Size; Locality; Eventuality—The Historical Faculty; Language, Its History and Culture; Color, and Its Uses; Order; Calculation; Time; Tune; Comparison; Causality the Basis of the Reasoning Power; Human Nature, or Intuition of Character; Agreeableness, Suavity, Vitativeness—Love of Life; Alimentiveness—Appetite, its Uses and Abuses; Acquisitiveness; Secretiveness, Policy; Cautiousness, its Uses and How to Train it; Approbativeness, its Uses and Proper Culture; Self-Esteem; Firmness, Obstinacy; Continuity; The Social Nature; Love of Children and Pets; Friendship, Fraternal Love; Inhabitiveness; Constructiveness, Mechanism; Ideality, Love of Beauty; Sublimity; Imitation; Mirthfulness, Wit, Humor; Conscientiousness, Duty, Justice; Hope, Anticipation; Spirituality—Sense of the Invisible and Immortal; Benevolence, Sympathy; Veneration, Devotion; Self-Culture; Principles of Phrenology and location of the organs; Definition of the Mental Faculties.

NOTICES OF THE PRESS.

"The well-known name of the author of this volume would lead the reader to anticipate an educational treatise on the principles of Phrenology. It abounds in valuable suggestions and counsels derived from many years experience, which can not fail to be of service to all who are engaged in the business of education. The subject is treated in a plain, familiar manner, abounding in examples drawn from every-day life, and adapted to reading in the family as well as in the study of the teacher."—*New York Tribune.*

"The plan and purpose of this work is to aid parents and teachers to understand the natural talents, dispositions, and temperaments of those under their guidance. The author shows how those different temperaments should be trained by different methods. This opens a new field to the consideration of the teacher, and will prove of great advantage to those who aim to secure the best results in their work. The text is attractive in style, and the illustrations, drawn from an experience of thirty years, make the work a valuable contribution to the educational literature of the times. It should find its way into the library of every parent and teacher."—*New England Journal of Education.*

"The writer of this volume shows how, on the Phrenological theory, children differ in educational susceptibility, and why, and prescribes methods for the training of different classes of minds."—*Church Journal.*

"This is an entirely new feature in a book intended for the use of teachers, and must prove of great advantage to them. The text is written in a manner which must attract every reader, and its numerous and apt illustrations assist the text greatly in pressing home the points advanced in such a manner as to be intelligible to every class of readers."—*The Methodist.*

"There is a great deal of good sense in the work, and believers in Phrenology will be glad to welcome the treatise. So should all conscientious teachers, whether familiar with the science or not."—*The Commonwealth.* Boston.

"Teachers will commit a great blunder if they allow the sub-title of 'How to Teach; or, Phrenology in the School-room and the Family,' to influence them against the book. . . . The lack of similar guidance in the school-room is the cause of incalculable hindrance. Mr. Sizer writes not as a theorist, but as a man who has made the human mind a subject of special study for a lifetime."—*Christian Union.*

"Prof. Sizer, whose experience and observations are of much value, has succeeded in giving his ideas in a form so simple and perspicuous, that he who runs may read and understand."—*Rural New Yorker.*

"No teacher, who loves his vocation, should neglect to read this well-written and well-printed contribution to the cause of education."—*Christian Instructor.*

This is one of the Books offered as a Premium to subscribers to THE PHRENOLOGICAL JOURNAL who subscribe before August 1st, 1877, remitting Twenty-five cents extra as postage on JOURNAL and Premium. Address at once. S. R. WELLS & Co., Publishers, 737 Broadway, New York.

HOW to RAISE FRUITS

A HAND-BOOK OF FRUIT CULTURE

BEING A GUIDE TO THE PROPER

Cultivation and Management of Fruit Trees, and of Grapes and Small Fruits, with condensed descriptions of many of the best and most popular varieties, with upwards of 100 *engravings. By* THOMAS GREGG. *Price,* $1.00.

A book which should be owned by every person who owns a rod of available land, and it will serve to secure success where now there is nothing but failure. As an indication of the merits of the work, we publish the following from the many

NOTICES OF THE PRESS.

"We feel it incumbent on us to recommend it to the readers of the *Rural*, as presenting in a condensed form much valuable matter. There are books on fruit culture four times its size with one-half its information. While we might take issue with the author on some minor points, as a whole we cheerfully commend it to all who have even one square rod of ground to cultivate."—*Rural New Yorker.*

"The author is a practical cultivator, and writes with interest and zeal, and these qualities go far toward making a valuable book."—*The Cultivator and Country Gentleman.*

"This recent addition to the admirable "How Series," published by this well-known house, embraces, within its 180 pages a careful digest of the experience and wisdom of the best fruit growers."—*Demorest.*

"We know of no book of its class which is likely to prove more satisfactory."—*Christian at Work.*

"The practical part of the book is largely devoted to lists of the best fruit trees, vines, etc., and their planting and after-culture. From a pretty careful examination of this part we are pleased to say that it is very well done, and that that class for whom it is intended, those with moderate means, may consult it with profit."—*Herald of Health.*

"With condensed descriptions of many of the best and most popular varieties. Is fully illustrated, conveniently arranged, and well worth the price."—*Ind. Farmer.*

"A manual for the use of the amateur fruit-raiser, with suggestions which the experienced pomologist may find profitable."—*Rod and Gun.*

"Its price considered, we know not the volume which contains a greater amount of useful information on fruits and their culture, and which is more tastefully gotten up."—*Western Christian Advocate.*

"A contribution an amateur horticulturist should especially welcome."—*Evening Traveler, Boston.*

"This is a very useful work, and should be in the hands of every one interested in fruit culture. It treats the subject very fully, and gives instructions in raising all kinds of fruits. Farmers often grope blindly along, grumbling at their want of success, when the investment of a small sum for a work like the above would shed light on the dark places, and turn the tide of success in their favor."—*The Housekeeper's Companion.*

The work should have a universal circulation, and AGENTS can do well in the sale of it. Special Terms to NURSERYMEN and TREE AGENTS. Sample by mail, post-paid, on receipt of price, $1.00. Address

LECTURES ON PHRENOLOGY

TO

Lyceums, Societies, Schools, Colleges, Individuals, etc.

Calls having been received for PHRENOLOGICAL LECTURES in different parts of the country,

The American Institute of Phrenology

has arranged to respond to these calls by furnishing able and popular Lecturers wherever desired, either for Single or Course Lectures. These Lectures will cover a great variety of topics in connection with Phrenology, and may be either popular or scientific.

LIBERAL TERMS will be made, the cost depending on the distance from New York, and the revenue coming from this source will become a part of the fund of the INSTITUTE for the purpose of its permanent establishment. Friends of the INSTITUTE should take such steps as will secure a Course of Lectures in every neighborhood. Full particulars will be sent on application to

S. R. WELLS & CO., 737 Broadway, New York.

NEW BOOKS ON HEALTH.

THE

Mother's Hygienic Hand-Book

For the Normal Development and Training of Women and Children, and the Treatment of their Diseases with Hygienic Agencies. By R. T. TRALL, M.D. 12mo, cloth, price $1. Fine edition, $1.25.

The great experience and ability of the author enables him to give just that practical advice which mothers need so often all through their lives, and this will be found by far the best work on the subject yet published. It covers the whole ground, and, if it be carefully read, will go far towards giving us an "ENLIGHTENED MOTHERHOOD." The work should be read by every wife and every woman who contemplates marriage. Mothers may place it in the hands of their daughters with words of commendation, and feel assured that they will be the better prepared for the responsibilities and duties of married life and motherhood. It is a fact that, other things being equal, the Diseases of Women and their infants are in direct ratio to the unhygienic habits of the mothers; and, this being the case, how important it is that the knowledge contained in this book should be widespread. Physicians, and nurses, and all who have the care of women and children, whether in health or disease, should read the **Mother's Hygienic Hand-Book.**

Digestion AND Dyspepsia.

A Complete Explanation of the Digestive Processes, with the Symptoms and Treatment of Dyspepsia and other Disorders of the Digestive Organs. Illustrated. By R. T. TRALL, M.D. Bound in Muslin, price $1.00.

This Book constitutes by far the best work on the subject ever published. With fifty Illustrations; showing with all possible fullness every process of Digestion, and giving all the causes, and directions for treatment of Dyspepsia, a disorder which, in its various forms, is the cause of nearly all the diseases from which the human race is suffering.

"DR. TRALL, the author, has for years enjoyed a wide reputation as a writer upon Hygiene as well as upon health topics generally. He is a clear, forcible, and thoroughly informed writer."—*Inter-Ocean.*

"The invalid will find valuable hygienic hints in this volume."—*Cincinnati Daily Gazette.*

"The book contains much valuable information and sound advice."—*Chicago Advance.*

S. R. WELLS & CO., Publishers, 737 Broadway, New York.

THE PHRENOLOGICAL JOURNAL AND LIFE ILLUSTRATED.

VOL. 65. 1877.

NUMBER 3.] *September, 1877.* [WHOLE No. 465.

RICHARD M. THOMPSON,

SECRETARY OF THE NAVY.

THE portrait before us indicates a man of uncommonly active temperament, as free from grossness and coarseness as a man well can be. There is almost feminine delicacy in the structure of the face and in its expression, and that peculiar absence

of animalism, hardness, severity, tyranny, and vulgarity which unfortunately mark so many faces and heads, particularly those of men prominent in the affairs of public life. The reader will observe that the side-head seems flattened; it is not bulged out between the corner of the eyebrow and the opening of the ears. We sometimes see heads that are very round and thick from side to side, indicating financial selfishness, animal appetite, with elements of cunning and cruelty. That sort of development seems to be quite deficient in this head, and therefore we have a right to expect a delicate, respectable, refined, spiritual-looking face. Being tall and commanding in figure, and being entirely free from surplus fullness, he must be remarkable for his physical activity—for a lithe, elegant, graceful style of action. He must be easy in his working power, and every fiber of his constitution be obedient to the mandates of the judgment and the will. For a man who is over sixty-eight years of age he has a young, sprightly look. There is nothing in that face that looks weary, worn, and sluggish—as if life had begun to be a burden; but everything about it speaks of that bright, cheerful spirit which relishes all that belongs to life, and appreciates everything that is refined, intellectual, moral, and spiritual.

That is a very harmonious intellect. The perceptive organs being large, enable him to appreciate all the facts of life; the qualities of matter; impart the love of truth, the disposition to acquire information, and the ability to use it to good advantage. The middle section of the forehead shows memory of facts, places, and times. He has the sign of excellent language, and the talent to acquire literary knowledge. The upper part of the forehead shows analytical power, discrimination, ability to reason and think, the disposition to study mind and motive, and ability to comprehend, at a glance, the qualities and characteristics of men. He appreciates the witty and the beautiful; is strongly inclined to be upright, sympathetical, devotional, persevering, and honest.

He has the sign of energy combined with activity, and will incline to mingle intellectual and moral qualities with all the forces of his nature. He is not a man who is adapted to smite his way through physical obstacles and become master of affairs connected merely with matter, but is a natural educator; is adapted to teach, to put forth ideas, to lead the world in its intellectual and moral phases, rather than to guide its fiscal affairs and achieve its physical ends. Some men are adapted to fight the battle of life in building roads through mountain regions, riding the stormy ocean, and curbing the turbulence of rough men and fierce animals; they have in themselves a great deal of that which is forcible and fierce, but they are not adapted to rule in the higher realm of mind and character. This gentleman belongs to the mental and moral, rather than to the physical department of life and its affairs.

Of the Cabinet appointments made by President Hayes immediately upon his assumption of the Executive chair, that of Richard M. Thompson, to be Secretary of the Navy, appeared to be received with particular satisfaction. Although nearly seventy years of age, having been born in Culpepper County, Virginia, on the 9th of June, 1809, Mr. Thompson's vigor of body and mind, and honorable career in public and private life, commanded the approval of all parties. He comes of a stock regarded as highly respectable. His parents being in good circumstances, were able to give him an excellent education, including a collegiate course. As a youth, however, he inclined toward adventure, and before he became

of age, roamed into the wilds of Kentucky, where several years were spent in an adventurous career, and then he settled in Louisville, taking the place of a clerk in a country store. The duties, however, of this relation soon became over-tiresome, and he left it and went to Lawrence County, Indiana, where an opportunity being afforded for teaching school, he tried that. A few months sufficed to tire him of pedagogics, and he again entered a store, this time having the intention of making merchandising his vocation. Here, however, he took up the study of law, and devoted his nights to it. After three years' preparation, he applied for admission to the bar of the State of his adoption, and was admitted. This introduction to the practice of law proved but the introduction to an active political career, for the same year of his enrollment as a lawyer he was elected to serve as representative of the Whig party in the Legislature of Indiana. The following year he was re-elected, and the year after that, viz., 1836, he was chosen Senator, and during the two years' term served as president *pro tempore* of the body, and acted also as Lieutenant-Governor.

The exciting Presidential campaign of 1840 awakened his zealous interest, and he labored in behalf of the Harrison party, both as a writer and speaker. At the election he served as Presidential Elector. All this political experience served to advance his reputation materially, and in 1841 he was made a Whig candidate for Congress, and elected for the term which ended in 1843. In 1844 we find him again a Presidential Elector; in 1847 a second time candidate for Representative in Congress, and successful. At the close of this term he withdrew somewhat from active politics, and devoted himself to the practice of his profession at Terra Haute. His friends did not, of course, let him off easily, but proffered numerous honorable positions, which he declined. The confidence which was placed in his ability is exhibited by the fact that, under President Tyler's administration, he was offered the appointment of *Chargé d'affaires* to Austria. He was also offered the office of Recorder of the General Land Office by President Fillmore.

In 1860, after ten years of private life, we find him again in the arena, framing and reading the resolutions adopted, as its platform, by the Republican Convention at Chicago. As may be inferred from this participation in the canvass, he was a warm supporter of Lincoln, casting his vote in his behalf as Presidential Elector in 1864. He has the reputation, in the West, of having prepared a greater number of party platforms than any other living politician. In 1868 he was delegate to the Republican National Convention in Chicago, which nominated General Grant. In 1876 he acted as chairman of the Indiana delegation to the Cincinnati Convention, at which time he offered the name of Senator Morton in a speech which was marked by its vigor and eloquence.

Mr. Thompson is in the possession of excellent health, his tall, commanding figure evincing in every movement the elastic energy of fifty, and such mental freshness as is rarely met with in persons of his age. His countenance is indicative of strength, softened and refined by culture, and it is attractive to the observer. As a speaker he is dignified—a little formal, perhaps, yet persuasive and impressive. He is considered one of the best political speakers of the day. The general poise of the man reminds one of the characterizations of gentlemen of the old school.

THE MUSCLES AND FACIAL EXPRESSION.—The great Callen has said, that man alone among all beings possesses a physiognomy, because alone he has a soul; and has received an open and smooth visage in order that nothing might fetter the external manifestation of the numerous passions which agitate him. Hence, the marvelous personal dissimilarity among human beings, which the increase of mankind will never diminish. Poets and painters labor unceasingly to depict the ideal human visage, to search to portray the primitive type; and physiologists, not the less laboriously study by what mechanism the features undergo so

numerous changes, under the influence of the passions. In this study Duchenne, of Boulogne, has long been distinguished by the perseverance and the ingenuity of his searches. There are twenty-six muscles which bring about the expression of the features, and while each can act in an isolated manner, they ordinarily work in groups of twos and threes. M. Duchenne not only produces the expression of the passions by electricity, while the subject operated upon is perfectly passive, but he fixes these impressions by means of photography. According to him, the features are never in a state of repose, and certain movements, constantly repeated under the influence of a predominating sentiment, produce those wrinkles which form the stamp of physiognomy; hence, why the face is designated "the mirror of the soul." Duchenne asserts that these tiny muscles which are developed upon the skin of the face, constitute an immutable alphabet for expressing the same sentiment among the peoples the most separated, thus indicating a common origin. These movements of the features are a natural manifestation, quite independent of the will, and this absence of connection can be best comprehended in the case of a man, a prey to natural terror, and the accomplished actor, who succeeds in depicting the same passion by force of will.

LETTERS FROM A SON IN COLLEGE.

No. I.

THE STUDY OF METAPHYSICS ACCORDING TO THE SCHOOLS.

MY DEAR FATHER:—I write you in much perplexity and discouragement for some words of counsel and cheer, if there are any that you can give me. We have just finished our first term of Senior year, and have passed through our course of instruction in mental philosophy. I have always regarded the studies of Senior year as well fitted to crown our course of instruction, and have looked forward with pleasing anticipations to the time when we should be freed from the dry details of Greek roots, conic sections, and logarithms, and should rise into the higher fields of political science, and mental and moral philosophy. But I confess, as I sit to-night looking back over the term just closed, and listening to the boisterous rejoicings of my fellow-students over the last examination finished, that I feel quite blue and disheartened. Your previous letters gave me such clear ideas of the wise adaptability, the harmony, and the complete unity which characterize the elements of man's physical nature, and showed me how completely our physical well-being may be secured by obedience to the laws which govern our bodily frames, that I looked forward with much expectation to our course in mental science, hoping that it would give me as clear an exposition of man's mental nature as your letters had previously done of his physical. But our course of instruction in this department is finished, and my expectations have not been realized.

This has occurred not from any lack of diligence on my part, nor from want of ability and faithfulness on the part of my teacher. He has certainly been zealous in his endeavors to give me a clear view of the principles of the science, and I have applied myself so earnestly to the subject as often, I fear, to violate your express injunctions in regard to health. There is something about the system so incomprehensible and ambiguous, and when applied to the common affairs of life, so impracticable and unsatisfactory, that it has sometimes appeared to me more like a figment of the imagination than a science founded in nature. Were I alone in this opinion of the subject, my inability to obtain a clear view of it might be attributed to mental incapacity. But since some of the best scholars in the class have met with the same difficulties which I have experienced, and complain of their inability to make any practically useful application of the principles of the science, I can not but think that the fault must lie in the subject itself, or its method of treatment.

But perhaps, after all, I am premature in my despondency because I have not obtained a clear understanding of the subject in a single term. For I remember that one or two lessons were taken up at the beginning of the course with a consideration of the peculiar difficulties which naturally lie in the way of mental investigation. "The subject," we were told, "is, for many reasons, obscure, demanding the most patient and profound study." The difficulty of turning the mind in upon itself, and making its own phenomena the object of its investigation, was represented as one of the greatest magnitude, because from infancy "the mind has been accustomed in its agency to turn its attention outward to the phenomena of nature, and gain its facts in the perception of the objects of an external world." This old habit, we were told, must be broken up, and a habit of looking inward must be cultivated. "The mind is to make its own phenomena its study, and turn its attention inward on its own action. It is, as it were, to hold itself out to its own inspection, and turn itself round on all sides to its own observation. The organs of sense must be shut up, and the material world shut out, and the mind shut in upon itself and made to become familiar with its own action." For we could not expect to make any satisfactory progress in mental science till we had acquired this habit of introspection.

We were told, moreover, for our encouragement: "That it should not be anticipated by any student that this difficulty would be overcome without rigid and persevering self-discipline, because the effort steadily to look in this unaccustomed direction induces a weariness which destroys the capability for clear perception and patient investigation. On this account the fixed and prolonged observation of the inner mental world is the chosen employment of comparatively few minds, probably not more than one in a thousand of our more enlightened communities."

These difficulties, it must be conceded, are discouragingly formidable, and well calculated to dishearten all but the one in a thousand who is so fortunate as to have a natural predilection for shutting up the organs of sense, shutting out the material world, and shutting in the mind upon itself.

I am really in earnest in my desire to gain a clear view of the laws and principles of mind; and though my efforts thus far have been discouragingly unsatisfactory, I do not propose to give up my search after truth; but that search would be prosecuted with much greater zeal and hopefulness if a number of doubts and difficulties which have presented themselves to me during the progress of my study should be satisfactorily resolved. I will therefore present these to you, hoping that you will be able to give them clearer and more explicit explanations than I have been able to obtain from my teacher.

We have been taught that the mind is a self-active agency, and that as such it impels the individual to certain habits of thought, modes of life, and courses of conduct, which constitute in him a distinctive character. Now my idea of the object of mental science is that it should resolve the mind into its constituent elements, and give us such a comprehensive view of its principles and laws that we may be able to trace the deeds and characters of men back to their sources in the mind. And having thus obtained a knowledge of the mental faculties, their laws and modes of activity, then we would have definite rules for the training and developing of mind and character. It was upon principles analogous to these that I pursued the study of physiology, and with the very best results. By becoming familiar with the different parts of the body, their functions, and laws of activity, I have been enabled to trace many of the ills which I formerly suffered back to their true source, and to deduce rules for the practical direction of my conduct, which have insured to me the best of health. But in my efforts to reduce to practice the principles of mind as they have been unfolded to us during the past term, I have utterly failed. In the first place, I have never been able to get a clear idea of what constitutes a mental faculty. In the second place, I have never been able to learn by what laws, if any, the mental faculties are governed. And in the third place, I have never been able to trace the

common characteristics which we observe among men back to their origin in the faculties.

On the contrary, I have become bewildered amid a mass of obscure definitions, mazes of metaphysical subtleties, flights of metaphysical fancies, and wire-drawn distinctions, in which it was necessary to draw upon the imagination to discover any differences. In short, so far as obtaining rules for the practical direction of conduct in the common affairs of life, I might just as well have devoted my time to the study of Choctaw.

Now, in the first place, I would like to have a definite idea of what constitutes a mental faculty. Sensation is given as one of the "primitive facts of mind," and we have in this the five senses as faculties for hearing, seeing, tasting, smelling, and feeling. These faculties are clear and distinct. Each has its appropriate organ, which performs its peculiar function in accordance with the laws of its organization. After we have become familiar with these laws, and are able to use the organs of the five senses in a manner favorable to their highest efficiency, we feel that we know all about these organs which is practically useful. But when we are told that "the identification of the reciprocal modification of both the recipient organ and that which has been received, is precisely what is meant by sensation," we instinctively feel that we have been elevated from the commonplace sphere of the practical into the exalted region of the metaphysical.

Now a mental faculty, as near as I can get at it, is a mode of mental manifestation. It is in a similar sense one of the ultimate principles of mind, as an element is one of the ultimate principles of matter. The human mind is divided by our system of philosophy into three grand divisions: the Intellect, which is the capacity for knowing; the Susceptibility, which is the capacity for feeling; and the Will, which is the capacity for willing. Under Intellect there are given as mental faculties—external sense, internal sense, fancy, memory, conception, association, abstraction, reflection, judgment, syllogistic conclusion, induction, imagination, and reason. Now these being the elements or the ultimate principles of the intellect, I suppose all mental exercise connected with the capacity for knowing, must originate in one or the other of these mental faculties. When, therefore, we are told that "the poet, mathematician, painter, or sculptor seems often to have an innate propensity, each to his special employment; and different trades and occupations often find such as have a natural adaptation to the particular pursuit," I suppose we must look to the mental faculties as the source of these original biases, because these, doubtless, result from an unusual endowment of one or several faculties.

What, then, are the faculties which give to the poet, the painter, or the sculptor a natural predilection for his special pursuit? I should suppose that fancy, conception, association, and imagination are all essential to a taste for these different pursuits; but I am at a loss to explain why, with these faculties, the poet is not equally a painter, or the painter a sculptor. For is it not true that a man may be an excellent poet, but a bad painter? or a skillful sculptor, without having any inclination to write verse or paint pictures?

Again: I observe among my fellow-students a great diversity of talent, which I have endeavored in vain to trace back to their origin in these mental faculties. One is an excellent mathematician, but in other departments of study is only an average scholar; another is especially distinguished for his ability as a writer and speaker; and another for his skill as a musician. Now what is the faculty which gives a natural taste for mathematics? Is it abstraction, reflection, induction, or reason? Doubtless, some or all of these are essential to the mathematician, but are they not equally as essential to the metaphysician? To what faculties are we to look for the natural ability to give expression to ideas by voice or pen? Is it to association, judgment, or internal sense? To what faculty may a talent for music be referred? I confess I am unable to conjecture, unless it be syllogistic conclusion.

Upon referring to my teacher for an ex-

planation of these difficulties, he said that these biases might result from training, casual occurrences, or the circumstances in which the individual is placed. Much depended upon attention, or the power of fixing the mind intently upon any given subject. Sir Isaac Newton, he said, once remarked that he did not know that there was any difference in mental capacity between him and other men, except in the power of application. He was able to fix his mind so intently on a given point as to shut out entirely all extraneous ideas; and thus he was enabled to bridge the deepest chasms, and scale the loftiest peaks of philosophy, which to men of less intensity of mind were impassable and inaccessible. I could see that training is very important in attaining excellence in any occupation; I could see, also, that the circumstances in which an individual is placed may greatly favor the development of certain tastes. But it occurred to me that many individuals, even with the best training, are often surpassed by those whose opportunities have been limited. And if excellence in any given direction is merely a matter of application, I suppose Newton, who was a profound mathematician and philosopher, might have become equally as celebrated as a poet or a painter, had he given his attention to these pursuits. Possibly this might have been true of Newton; but I think the common experience of men is opposed to such a theory; certainly among my fellow-students there are those who excel in some branches with very little effort, while in other departments they are unable to obtain an average standing, even with the most diligent application.

But my difficulties augment the more I endeavor to get a substantial basis for my progress in clear ideas of these mental faculties. My text-book says of reflection, which it gives as one of the primitive faculties of mind, "The *habit* of reflection is always with difficulty attained." As the mind is a self-active agency, and its faculties are merely different modes of its manifestation, I supposed that these faculties were innate in the mental constitution, and manifested themselves spontaneously in their different ways upon the presentation to them of their appropriate objects. But here we find a faculty which is synonymous with habit, and which can with difficulty be acquired. Am I to understand that the mind is a blank at birth, and that all its faculties are acquired? If so, can there be any such thing as mental science? For upon what principles can it be affirmed that the mind will go out into such and such modes of manifestation?

My attempts to unravel the mystery of these faculties are still further complicated by the introduction of three general states. "The mind, as self-active, produces itself into several different general states, which thus become each respectively a capacity for specific single exercises. It is here assumed that all single acts may originate in one or the other of these general states, and which states we will here denominate as the Intellectual state, the Emotive state, and the Willing state."

These different states are illustrated thus: "You may imagine yourself as having been among the audience which listened to the great Athenian orator in one of his terrible Phillipics. In an intellectual state you apprehended his exordium, so appropriate, so captivating; his narration of topics and arrangement of matter, so skillful, so logical; his delineation of acts and events, so graphic, so consecutive; and his whole argument, so comprehensive, so conclusive; that your mind was elevated and filled with the thought which revealed and proved and made you to know so much. But you did not rest merely in knowing; you opened your mind to emotion and felt the glow of patriotism, the deep sense of national honor, the shame of servitude, the disgrace of cowardice, and burning indignation against the tyrant. But neither did you rest in this state of deep emotion; you roused every energy of your enkindled spirit, and held all ready for the most prompt and determined execution; while you shouted with the thousands of Athens—'Let us march against Philip!'"

Now, if the mind, as a self-active agency, goes out in specific modes of activity, through its individual faculties, I can not

see the use of encumbering the subject with a consideration of these different states. When a man approaches me with a view of winning my support to a certain measure, my reflection, judgment, and reason are called into activity in the consideration of the facts and arguments which he presents. Other faculties may indeed be concerned to a greater or less extent in giving me a correct view of the merits of the subject, but it is by no means essential that every intellectual faculty be called into activity. What, then, is the advantage of considering the mind as first projecting itself into a certain general state, which embraces all these faculties, and then being diverted into one, two, three, or four of the dozen different channels comprehended within that state? The only explanation of the matter which occurs to me, is that the manifestation of the individual faculties may be intensified by this operation — as the water which turns the mill-wheel has its power increased by being diverted from the broad stream into a narrower channel.

I suppose it is reasonable to think that among the audience of the great Athenian orator different individuals would be differently influenced by his Phillipics. In the Intellectual state, some would be particularly struck with the force of his logic; others with the beauty of his diction; others with the power and energy of his style; and others with the appropriateness of his illustrations. In the Emotive state, also, some would expend their feeling in admiration of the orator; others would have their patriotic feelings deeply stirred and be moved to violent indignation against the tyrant; while others would listen to the oration with a comparatively calm exterior. Now I would like to know the connection between these different general states and the different modes of mental manifestation under each state. Is it absolutely essential that the mind project itself into one of these general states before it can go out into a particular mode of manifestation? Or, if two mental leaps are essential to the manifestation of a particular thought, emotion, or volition, is there anything in the first leap to indicate in what direction the second will be taken?

I hope you will not consider me over-critical in these matters, but really my difficulties seem to grow the further I proceed; for here comes in another view to complicate these general states still further. My text-book says: "An original peculiarity of mind may be an occasion for these general states in reference to particular ends of action. The native artist is ever prompt to know, feel, and will in reference to favorite topics. The native poet or mathematician is permanently in readiness for all specific exercises which relate to his congenial pursuit. But aside from all constitutional bias, an act of will may be an occasion for the self-active mind to produce within itself the required general capacity."

When I had attained a notion of the individual faculties, I supposed I had reached the last analysis of mind, according to our system. It appeared to me that it only required the given occasion to cause the mind to go forth spontaneously into exercises of memory, association, abstraction, conception, etc. But I found that back of the individual faculties lay three general states, and that it was necessary to consider the mind as projecting itself into one or more of these states before it was capable of manifesting itself through the individual faculties. Here, surely, I thought, I had reached the true basis of our philosophy, beyond which it would be unnecessary to study mind, unless we would discover its essence, and all attempts of this sort our philosophy disclaimed. But now I find, that even in the general states I had not reached the last analyses of mind; for back of these, as their cause and occasion, I find constitutional bias and will. I had supposed that these biases originated in a predominance of one or several mental faculties, since it is through the mind that they are manifested, and no attempt has been made to go back of the mind to ascertain their cause. Hence we have the anomaly of an irresistible tendency to activity of a portion of the mind, projecting the mind as a whole into a certain state, that it may go out into activity through the individual faculties which constitute this very portion.

Again we are told that "the Intellectual

state is immediately from the self-activity; the Emotive state is attained only in connection with the Intellectual state; and the Willing state is attained only in connection with both the Intellectual and the Emotive states. A choice or any act of the will demands an object in which it may terminate, as truly as does an emotion. We can not choose, except there is something in the consciousness on which the choice may fix itself. There must be some object as known, and thus the necessity for an Intellectual state. But the mere dry apprehension of an object is not a sufficient occasion for a choice. There is nothing which can properly be called a motive or reason. Some feeling must be awakened toward the object, either of desire or obligation, or the conditions for volition are not given. We can not choose unless there is something congenial to be attained in the choice, and this can occur only in an Emotive state. As well no object as an object which awakens no feeling of interest or of duty. The Willing state, as capacity for putting forth any voluntary exercises, must thus be preceded by both an object known and an object felt, and must thus be occasioned by both an Intellectual and an Emotive state."

Contrast this with the closing clause of the previous quotation: "An act of the will may be an occasion for the self-active mind to produce within itself the required general capacity." Here again we have the anomaly of the will, which can be manifested only in the Willing state, which state "must be occasioned by both an Intellectual and an Emotive state," actually producing the states, without the previous existence of which, we were told, it itself could not exist.

I begin to fully appreciate the magnitude of the difficulties against which we were warned in the beginning. I fully concur with our author that "the subject is for many reasons obscure;" for even with "the most patient and profound study" I have not been able to fathom the mysteries of its fundamental principles. Perhaps, however, it is asking too much of metaphysics to demand that its principles be brought to the test of common experience, since in the investigation of mind we were expressly enjoined "to shut up the organs of sense, to shut out the material world, and to shut in the mind upon itself," that, I suppose, it might revel amid the vagaries of its own imaginings, untrammeled by any considerations of their practical utility.

But again: We are told, "Where no particular bias is given from nature, and only passing circumstances prompt the mind to go into its general states, these will be especially fluctuating and unstable if not held in one direction by occasion of a steadfast purpose. Nothing makes a man consistently steadfast in either intellectual character, affection, or voluntary action, but the perpetual dominion of a deep and steadfast purpose."

Well may I cry out, like the Greek philosopher of old, "Eureka! Eureka!!" for I have at last found the ultimate principle of mind — "a deep and steadfast purpose." We have got down to the root of the matter at last; for back of the individual faculties, back of the general states, lies the all-potent principle — a deep and steadfast purpose. The states and faculties are its mere vassals. It holds the reins, and they are driven by it whithersoever it chooses. We will not question too closely the origin of this deep and steadfast purpose; whether it is a sort of *nisus*, springing up within us, perfectly independent of the material body and the immaterial soul; or whether it comes from the heavens above, the earth beneath, or the waters under the earth. It is enough to know that in it we have reached the true basis of our philosophy, beyond which human investigation becomes vague speculation. As the ancients rested satisfied in the belief that the world is supported on the back of a tortoise, without troubling themselves about what supported the tortoise, so I will rest satisfied in this tortoise of the mental world—a deep and steadfast purpose.

But I fear I have already wearied you with my doubts and difficulties, though I have not yet presented one-half of them. Perhaps, however, when the difficulties which encumber the principles of the science shall have been explained, those which occur in their application will be satisfactorily answered. While if the former can not be resolved, further consideration of the subject will be useless. Affectionately yours,

FILIUS CONFIDENS.

THREE GLORIOUS BEINGS ONCE.

THREE glorious beings once
Used all their highest powers,
The noblest work to make
To grace this world of ours.

Minerva, Neptune, Jove,
All joined the contest great,
And Momus was the judge
Their rival claims to state.

Then, first, Jove made a man,
One step from angel down—
To lead creation's van,
And wear creation's crown.

His brow a sky serene,
His eye a starry fire,
With godlike form and mien,
His soul a quivering lyre.

A house Minerva made,
Worthy an angel's home;
With halls with amber laid,
And shining sapphire dome.

And star-eyed lilies fair
Its azure walls traced o'er,
And gems and daisies rare
Inlaid its golden floor.

Over its windows high
Unfading roses climbed,
And tireless fountains nigh
Their fairy music chimed.

Then Neptune made a snowy bull,
With art and wisdom wise;
High arching horns so beautiful,
And great, far-seeing eyes.

Then spake the critic Momus—
So dignified and wise—
"This man's a failure, worthless,
No beauty in him lies.

"There should have been a window,
A window in his breast—
To show each thought and feeling,
Each fancy he possessed.

"This house is all lost labor—
It should have been on wheels,
To move from evil neighbor
Whene'er he swears or steals.

"This bull is very faulty, too—
A bull alone in name—
His horns should be his eyes below,
To see where he takes aim.

"There's no expression in his face,
No graceful curve of throat;
He don't deserve the smallest place
Among the bulls of note."

Then out from heaven, great father Jove,
With vengeful, flashing eyes,
The senseless critic furious drove,
And thus indignant cries:

"No beauty the fault-finding one
In others good can see;
Before you blame what we have done,
Yourself more perfect be.

"For he who finds the most of fault
Has most of faults his own;
And only greatest souls can let
Another's faults alone.

"For pruning here and praising there—
So all the flowers bloom forth—
Is the true critic's noble care,
And is his real worth.

"Ere you condemn our labors all
In spirit or in letter,
To aid you wit and wisdom call
And make us something better.

"Since Jove is older than you all,
Ye critics nice and wise,
Deep in your hearts his words should fall
Down from Olympian skies."

LYDIA M. MILLARD.

A GOOD WORK.—Whoever has written a single paragraph which has strengthened the weak, or improved the ignorant, or encouraged the faint-hearted, given fresh hope to the despairing, or softened the hard-hearted, or cleared the mists from the doubting mind, brought a happy smile into the eyes of the suffering, or turned a wanderer from the paths of destruction to the paths of Life, has certainly done a good work, although his reward may not be here. His work may seem as nothing in the eyes of those who judge of work simply by the number of dollars and cents which it has earned, or at which it may be estimated. Not that it should be inferred that good work does not deserve remuneration; but, whether rewarded or not, our work should bear the test of our own scrutinizing conscience. G. A. H.

THE KINGYO OF JAPAN.

LIFE IN THE DEEP.

THE researches of naturalists and explorers in the depth of the sea have revealed many things of which we previously had no conception. Not only the wonderful plants which are found hundreds and thousands of feet beneath the surface command the admiration and protracted analysis of scientists, but the extent and variety of animal life in the water fill us with astonishment. Not many years ago the keeping of a tank in which fish were preserved alive had the character of a curiosity; now many homes are adorned with aquaria, in some cases the private collection being of considerable extent, interest being shown in that direction by some persons just as libraries or collections of coins or bric-à-brac are made by those who have the time and means as well as the *penchant*. It is certainly a very pleasant employment of a part of one's leisure, to watch the movements of fish. Perhaps there is even more interest attached to the observation of the habits of the animal whose home is the water, than of the animal who lives on land, because the relations of the former are so entirely different and require a specially adapted organization. We have watched gold fish darting within the narrow boundaries of a glass globe and found much enjoyment in scanning their structure and action, and do not wonder that children are attracted by the glittering finny creatures whenever they see them.

In Europe the influence of the aquarium as an instructor of the public, has been appreciated to the extent of establishing it as a permanent feature in some of the large cities. Fish from the different quarters of the globe are there collected and placed in tanks so that their shapes, colors, equipage of fin and spine and gill can be conveniently seen. In London there is a collection of

very large extent; from the first opening, it has proved a central attraction to the London public. Some attempts were made in this country from time to time to organize an aquarium on a large scale, but until recently have not proved successful.

Now the citizens of New York rejoice over a series of animated pictures of life in the deep which have no superior anywhere. An enterprising gentleman by the name of W. C. Coup conceived the plan of which the present enterprise is the outcome, a few years ago. He proposed to the city authorities to construct an aquarium in the Central Park, under conditions which were necessarily connected with an undertaking so expensive; but as the Park Commission was not authorized to treat with him, on account of certain legal restrictions forbidding the use of public grounds under such conditions, Mr. Coup determined to attempt its establishment alone. Subsequently, however, other persons were associated with him, and the work was carried to the elaborate completion which it now presents.

The building, which was erected specially, is admirably adapted for the purpose, both by location and furniture, having an area large enough to permit a tasteful and convenient arrangement of tanks, rustic work, and statuary, so that the appearance of the whole is that of a garden where one can find grateful refreshment even when the dog-star burns the fiercest, on account of the great bodies of water inclosed in the tanks. There one can study the natural history of the sea in a scientific manner, if he please, so great is the variety of subjects afforded by the collection. There are fish large and fish small, the shark, the porpoise, those amphibious monsters, the hippopotamus, the sea-lion, and the alligator, the whale, the sturgeon, the skate, the octopus, the little sea-horse, the stickleback, the crab, the oyster and the scallop, the star-fish and the seal, the anemone and the sea-urchin, etc. There are the wonderfully-tailed—which is represented in the engraving at the head of this article—and the beautiful and graceful angel-fish, from the China seas; as well as the ugly-looking gurnard, dragon, and toad fish; there are fish with which we are familiar and hundreds which we never saw, but all possessing characteristics of interest, every one revealing in this new, yet very natural relation, habits and

SEA-HORSE.

qualities deserving close consideration. Here we find the little stickleback proudly disporting himself, asserting his sovereignty over fish much larger, building his nest in sight of the visitors. It is the father stickleback, as the reader probably knows, which takes care of the nest after the mother has deposited her eggs; thus performing the parental duty we humans generally leave to woman, with all the anxiety and solicitude which we would impute to the most earnest of parents.

THE ANGLER.

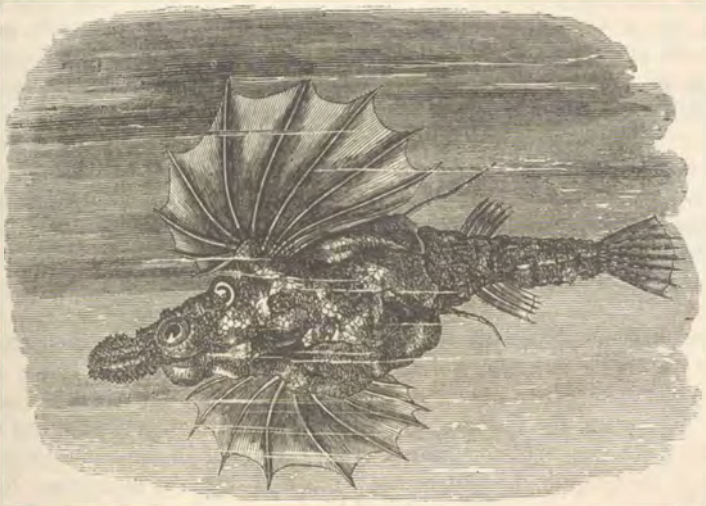
their varied organism, and their beautiful coloring, which truly entitles them to the name of the "flowers of the sea." There is the strangely-constructed angler, with his baited line, an engraving of which is given. Then, too, we are struck by the grotesque ugliness of the sea raven, whose very full armament of spines declares him a rather ugly customer to run against. The beautiful angel-fishes are a central attraction to visitors as a matter of course. We remember many years ago lingering with boyish delight over a case in Barnum's old museum down town, in which were two or three dried or preserved specimens of this inhabitant of the China seas. One can there safely contemplate those monsters, the shark, the hippopotamus, and the alligator, of whom all have read many terrible stories. Perhaps the seals furnish as much amusement as any of the denizens of the Aquarium. These soft-eyed creatures, with their graceful movements and really intelligent faces, afford entertainment to old and young.

One of the features worthy of notice of the Aquarium is its department of fish culture. There has been a great deal of talk in the newspapers during the past five or six years on this subject, but a practical illustration of

ALLIGATOR AND YOUNG.

There is the sea anemone, which strikes the visitor as more worthy a place in the garden among the plants than in the tank with the quick-darting finny tribe. But to the scientist these creatures offer a peculiarly attractive subject for study on account of which may not have been seen by one in ten of those who have read the accounts of the operations of Mr. Seth Green and others. In one trough may be seen, at the proper season, a host of minute perfect fish forms, in another the

embryo fish in the masses of quivering jelly or spawn.



It is from Japan that has been procured the wonderful three-tailed fish, or kingyo, for the possession of which an incredible sum was paid. What do our evolution friends say to him? But not only do we find fish, fish, fish, in this panorama of ocean life, but also scientific apparatus in proper departments for the use of the expert naturalist or student. There are experimental tanks, microscopes, a good assortment of scientific periodicals, a laboratory wherein plaster casts are taken of singular or rare specimens for the museum of the Aquarium, and for other educational institutions which may desire them. The aim of the management has been to present to the public as complete an organization of its kind as time, talent, and money could procure. No public work or institution in the city of New York surpasses the Aquarium in interest, in our opinion. Both entertainment and solid instruction are afforded to

ANEMONES, BULL-HEAD, HARVEST FISH, HERMIT CRAB, SCALLOPS, ETC.

the visitor. It is an excellent place for young people. Additions are being made constantly to the array of curious and rare fishes, so that repeated visits are indispensable to one who would learn much of life in the water, and a day spent there occasionally by a parent in company with his children could not but add materially to their stock of information.

Department of Our Social Relations.

Domestic happiness, thou only bliss
Of paradise that has survived the fall!
Thou art the nurse of virtue.

OUR WORK.

WE are stepping upon the threshold of a new century, and Progress is our motto. As a nation we have taken vast strides in the mechanical, the scientific, the artistic, the intellectual realms, but what advancement in the moral? Has it been in keeping with the rapid march of progress in other directions? Alas! the reeling, staggering, groaning monster, Sin, lifts its accursed head and answers, "No!" The myriad prisons and kindred institutions of our land echo with the sound of hollow voices answering, "No!" The vacant stare, the hollow eye, the piteous wail of the destitute and homeless answer, "No! No!"

But why so much iniquity, woe, and crime? With five letters the major part of the problem is solved—drink—strong drink.

The vices accruing from indulgence in stimulants are so familiar it is not necessary to reiterate them. They grow as rank as weeds in the black soil of the West, and are almost as familiar. But there is one so black, so horrible, that it commands more than a superficial thought in this column, viz., the deliberate murder of one man by another while under the influence of the deadly venom, strong drink. When we consider the enormity of this crime committed while in the wild frenzy of intoxication; this act of unconscious volition, staining the hands with the blood of a dear father or mother; when we consider the brutalizing effects resulting from excessive indulgence in liquors, can we, as enlightened beings, countenance in any degree the

use of fermented beverages? Can we withhold our influence for the right? Can we labor too earnestly in opening the eyes of the ignorant to the myriad injurious effects upon the physical, mental, and moral condition of the drinker? And not of the drinker alone, but the curse he brings directly and indirectly upon untold numbers, hereditary and influential.

Science and common-sense teach us that all fermented drinks—products of descending changes—contain little or no nourishment for the physical system of man. The exhilarating and stimulating effects produced by this unnatural narcotic are often misunderstood to be genuine strength; but when the stage of abnormal activity has subsided, a reaction ensues, and the building up of wasted brain and nerve-tissue commences.

Dr. Jewett, a veteran in the temperance lecture field, classes intemperance in three stages: first, increased activity of brain, producing merriment, excitement, and desire for a good time; second, derangement of mental powers—the criminal stage; and, third, the complete surrender of body and mind, resulting in stupidity.

Much is being said with regard to prison reform. Would it not be wise to effect reform outside the prison walls? Shall we, with folded hands, see our fathers, our brothers recklessly walking near the verge of the precipice; see the feet draw nearer and nearer; watch listlessly till the fatal step is taken, and then search amid the *débris* below for their mangled bodies, and vainly endeavor to restore them? God forbid! Let us be up and doing, for "soon the night cometh," and we can not work. Let us vigilantly endeavor to exterminate the fatal germ generating such poisonous fruit! Let us strike at the monster-root of so much evil, and in so doing forget not that we are dealing with precious souls. Aye, many of God's noblest and best are the unhappy victims of Bacchus. We can not treat them too kindly; we must extend to them the strong hand of sympathy, friendship, and help—make them to feel that they are our brothers. We must go down to them; we can not stand on the snowy mountain of disdain and win them by our freezing condescension. No! no! They must be made to feel that if they endeavor to rise from their fallen condition they will receive the sympathy, encouragement, and aid of all true souls with whom they are surrounded; for who can fathom the drunkard's need of sympathy?

There has been no practical method established for the complete reformation of the inebriate equivalent to the Reform Club. All members of the organization previously pledge themselves to abstain from any and every kind of intoxicating drink, and to sustain one another in conforming to their new mode of life. Meetings are appointed regularly, at which officers chosen from the members of the club preside, and the responsibility thus espoused serves to revive the embers of former manliness long buried 'neath the ashes of dissipation. New members are continually brought into the fold through the influence of present members, and thus the good seed is being sown in some parts of our land.

But however vigilant and zealous the members of such organizations may be, they need the hearty co-operation of wives, sisters, and mothers. Indeed, they have already accomplished more, in the brief time since the praying bands were organized, than all that has been accomplished hitherto. They struck the key-note to success—prayer—and, trusting in God, they have received strength to hope on—work on—and their efforts have been and are being crowned with success.

Many of the men rescued from a drunkard's grave have no homes, or very unattractive ones, and they need pleasant, inviting rooms, provided with books, pictures, music, and different sources of amusement, where they may assemble evenings, or spend their leisure hours. A cheerful resort, such as the loving hearts and willing hands of all true wives and sisters should aid in appointing, will serve as the beacon-light whose shimmering rays will warn and entice them from the yawning abysses and seductive dens reeking with odors and resounding with the drunken *canaille*.

As we step upon the threshold of the new century, and behold the light of its glorious

dawning, let us catch a glimpse of the illustrious achievements that will inevitably result from our whole-souled endeavors in the right. Let us burst the bonds of lethargy that have too long withheld us, and strive, with new inspiration, to fight the battle of life.

No one is exempt from duty in the temperance reformation; it is a call for universal labor. Physicians should avoid administering the poison; clergymen should preach temperance from the pulpit; fathers and mothers should brand the truths of temperance upon the plastic minds and hearts of their little ones in such a manner that they will ever cherish an implacable revulsion for every drop of degradation, be it wine, beer, or any product of distillation. Young ladies should not withhold their influence in the great reformation; their sphere is unlimited. There should exist, in every town, three flourishing temperance organizations. The Reform Club, the Woman's, and the Young Folks' or Children's Society. Opportunity to escape from former iniquity and protection from it is thus afforded persons of all ages and classes. No sectarian, political, or aristocratic views should be allowed to retard the universal co-operation of all members.

When every temperate citizen is keenly alive to the importance of this work; when what is disreputable for the poor man is considered disreputable for the rich; when temperate men only are elected to office; when the intellectual, influential portion of our communities live temperate lives; when the moral standard is raised by all to whom power, knowledge, and position are given; when strict compulsory laws join hands with education, intellectual and moral, upon the subject for the masses, we may expect to see not only grog dens closed, but prison cells, now filled, vacant; miserable homes made happy, and the world making an onward and upward progress of which we can now but slightly conceive.

GRAZIL.

LIGHT IN DARK PLACES.

"This mournful truth is everywhere confessed,
Slow rises worth by poverty depressed."—SAMUEL JOHNSON.

CHAPTER IV.

HOW THEY MANAGED TO LIVE.

SADIE did not communicate the affair with the junior member of the bindery firm to her mother that night. She concluded to wait a while—"just keep quiet," as Betty had advised, and see what further developments there might be. She thought that Mr. Gaff would not go so far as to insist upon her compliance with his wishes, and thus drive her out of the bindery; for she had determined to leave it sooner than act wrongly, although the few dollars her labor yielded were important to the little household, as her mother's needle-work could not now be depended upon to procure the food they needed from week to week. The pinch of the times held the Camps in an iron clutch, yet such was the frugality and ingenuity of the mother that the ridiculously small aggregate which the earnings of the three who could work made at the week's end, seemed to go about twice as far as it would in the hands of other housekeepers in her neighborhood. The superintendent of the mission chapel which she attended with all possible regularity, had proffered the aid which his Society was organized to supply, should she need it; but Mrs. Camp shrank from any recourse to charity unless it was absolutely indispensable; besides, she knew that the Society was beset with appeals for help by thousands whose dependence in the way of employment had been lost by the closing of stores and work-shops, and however much their misery might be due to wastefulness or intemperance, the poor creatures were suffering and must be fed. Although often reduced to the last cent before Sadie could draw her fortnight's wages, or she could obtain the payment for the dozen vests which had been sent to the warehouse, yet

Mrs. Camp usually had a piece of bread to give to a half-starved child or woman whose piteous face might look in upon her. The poor know the poor's needs best, and it is intelligent poverty that can best dispense the material of charity.

"Mother, you must be a witch," said Norton, the day after the incidents related in our last chapter; "there's Bumpy's father and mother both living and both working, and getting more money than all of us together, and yet Bumpy says that his 'mam' —that's the way he calls her—goes to the mission for help, and gets a basketful of

BUMPY AS A NURSE.

things nearly every Saturday. And they've only three children; isn't it mean, mother?"

"I don't know their circumstances, Nortie, and we shouldn't be so quick to pass judgment on others."

"Why, mother, Bumpy told me that his 'old pop'—that's how he speaks of his father—had a job down in a foundry and got a dollar and a quarter a day, and his 'mam' went to wash in a boarding-house on Pearl Street twice a week and got a dollar and a half a day for it."

"Well, my son, how much does what his father and mother get, amount to altogether?"

"Let me see," said Norton half to himself, "six times a dollar and a quarter, is—thirty—five—seven—seven dollars and fifty cents, and twice one-fifty is three. That makes ten dollars and fifty cents. But I forgot to tell you that Bumpy's big brother Larry sells newspapers, and sometimes makes more than a dollar a day, and he pays his mother two dollars a week for his board. So that's two dollars more. Twelve dollars and a half. Isn't that more than we get, mother?"

"Yes, my son, nine dollars is a very unusual amount for Sadie, you, and me to earn in a week."

"If you were as big and strong as Bumpy's mother you could make a great deal more money, couldn't you, mother?"

"Perhaps I could, my dear, but now the times are hard for almost everybody and employment is very scarce everywhere."

"But you ought to see the place where Bumpy's folks live. It isn't half as nice and clean as our two rooms. I was there last Tuesday; the carpet was half rags, and bits of wood and shavings lay about, and the stove was cracked and rusty, ugh!" and Norton shrugged his shoulders in disgust. "I don't see why people can't live decently when there's no excuse."

"My son will learn as he grows older that people are very different by nature. Some are born orderly, quiet, economical, industrious, while others, and I fear they are much the more numerous, are born with tendencies to carelessness, disorder, extravagance, and sloth. We must make great allowances sometimes for the defects and weaknesses of people, and at the same time, if we think ourselves much better we should try to do the best we can."

"But it seems to me, mother, that most of these people here don't try much to help themselves. They just lie around, and smoke, and drink, and eat the things given them by other people."

"Many, too many, Norton, take advantage of the kindness of others. It is one of the tendencies of our nature as human beings, that when we are poor, broken down and dependent, we lose courage and strength and begin to despair of getting up again.

This is the case particularly with those who have brought themselves down through bad habits. I trust that all my son sees around him will but stimulate him to effort to rise above vice and everything wicked and low. By striving earnestly and constantly, my dear boy, you will in time rise to a position of honor and usefulness. Many of the best men the world has ever known were born in as humble surroundings as these of ours, and some were born in even lower places, yet industry and determination won great honor for them. The excellent John Todd was born in an almshouse, and the eminent explorer, Livingstone, in his childhood and youth, lived amid scenes like those in our streets. It is what is in you which will make your future respectable, not what is around you."

"Dear mother," cried Norton, with kindling eye, "do you think that I could ever become such a man as Mr. Jeffers?" (Mr. J. was the President of the Mission Society, and sometimes presided at a meeting. He was of noble presence, and of course contrasted very sharply with the rough people whom Norton saw every day).

"Yes, I think my boy can hope to become as useful and good a man. He can try, at any rate."

"Dell," who had been sitting by the window while this colloquy was going on, here shouted out: "There's Mrs. Fadden's baby; oh, what a darling little fat puddin'!"

Norton laughed, and said: "Dell, you ought to see Bumpy tending his 'mam's' baby while she's out washing. He does it just as well as any nurse I ever saw. Bumpy's a real good fellow in some things, or he wouldn't stay home all day taking care of that baby. I guess you'd catch the other boys doing it for their mothers. Bumpy sometimes goes down in the front door and sits on the step with that little fat thing on his knees, and I've heard the boys laugh at him and call him 'nuss gal,' 'mammy's nuss gal,' but 'twouldn't make him angry a bit. And I know I wouldn't like to be tied to such a heavy, dirty-looking baby five or six hours. I used to think it was real hard to have to hold Dell a few minutes when she was a little thing."

"Bumpy's a born nurse, I think," said Mrs. Camp, smiling at his comments, "and you are not. No doubt if he were educated and well trained he would become a valuable man for some public purpose, a teacher, or minister, or superintendent in some benevolent institution. But, Nortie, it is nearly three o'clock, and time for you to go to the *Mail* office for your papers."

"Yes, mother, I've just looked over at the church clock, and will be off in a second."

CHAPTER V.

HOW SHE DOCTORED MICKEY.

A tap at the door of the Camps' apartments was heard soon after Norton had gone out, and little Dell ran to open it. A tall, gaunt woman stood there, whose scanty and soiled garments told of her neighborhood belongings.

"Uh, me little angel, is yer mither in, an' kin the loikes o' me spake wid her?"

"Come in, Mrs. Moriarty," said Mrs. Camp kindly.

"It's sorry I am to be throublin' ye," burst out the poor woman, entering in response to the invitation; "but there's me b'y down wid a faver, an' I'm jist at me wits' end for wantin' to know what to do. Musha, an' didn't I go to the dispinsary this mornin' airly, and the docther promised to come and tind to him, but sorra a bit of the fine jintlemin have I seen all the day."

"Perhaps I can be of some service to you," said Mrs. Camp, rising and laying aside the material on which she was sewing.

"Indade, indade, my leddy, I know ye can be of sarvice. An' shure I wouldn't tak' ye 'way from your worruk, for I know ivery minnit is preciss to ye. But yer kind heart 'll be rewarded, I know, sometime, if the blessin's of such as Bridgit Moriarty and those in the house I'm a knowin' will do it. But," continued the warm-hearted woman, with moistened eyes, "I'd not be afther exposin' yer own swate little darlint. Fur it may be the bad faver my Mickey is havin'; shure an' his face has rid spots on it, and at toimes he's out of his head intirely."

"We will go up at once to him," emphasized Mrs. Camp. "Dell, my dearie, stay very quietly till mamma returns."

Up-stairs went the two into the room of Mrs. Moriarty, where, tossing to and fro upon a thin straw mattress, which occupied one corner, was the little boy Mickey. A delicate child, unfit for the close, unsavory atmosphere of a room which served for kitchen, bedroom and parlor for four, and made more delicate and susceptible to sickness by the coarse, unpalatable food which he was compelled to eat. Mrs. Camp took the case in at a glance. An attack of scarlet fever. There were many similar cases in the neighborhood. The wet and late spring had developed the fell disease in many parts of the city to an almost epidemic extent.

MRS. MORIARTY AND THE DOCTOR.

"Go down to the hydrant and get a pail of water, please, Mrs. Moriarty," said Mrs. Camp.

"Here's wan that was brought up but a minnit afore I wint down fur ye," replied Bridget.

"Let me have it right by Mickey's bed, and if you have any towels or bits of clean muslin let me have them."

Bridget hastened with all a mother's anxiety to provide the articles, and the few towels she had, worn and flimsy enough, were handed to the lady "doctor."

"Now I wish you to notice carefully what I do, so that you can do it yourself."

"Yis, that I will."

Mrs. Camp took the largest and thickest of the towels and wrapped it around the child's body, well up about his little chest, then soaking another in the cool water she applied it to his forehead and face gently, and then wrung it over the bandage, and then resoaking the towel, she again wrung it over the towel-bandage until the part covering the boy's breast was saturated.

"Now, Mrs. Moriarty, you will see by putting your finger on his temple that his pulse is very quick."

"Yis, ma'am, 'tis terrible fasht and strong."

"Well, I want you to freshen this bandage as soon as you find it getting warm to the touch. Squeeze out the water into a basin, and use the cold, and take a soft cloth and now and then bathe his face. Besides, you must rub his feet and ankles to keep them warm, if they feel cold, and keep them covered with that quilt. You must go on with the wetting of the bandage until you find the pulse getting slower and quiet, and the skin cool and soft. Do you understand me?"

"Yis, me swate leddy, I'm afther thinkin' I do. An' will ye jest be showin' me agin' how ye do it."

Mrs. Camp repeated the process, the boy showing evident gratification under her gentle manipulations and cool hand. "Try to avoid wetting the bed," she admonished; "and if you had something—an old comfortable, say—to put under him while bathing him, it would be better, of course, for after having cooled his blood and brought down the pulse to what is more like the natural heat, you could take it out, and the bed then would have escaped any wetting. The air in this room is not good for him. Let me show you how to introduce some from the outside without making a draft which might be injurious." Then going to a window, Mrs. Camp pushed up the bottom sash until its lower edge just escaped the strip which bound the part of the sill on which it rested when down. This slight elevation, however, made an open lap of nearly two inches be-

tween the upper and lower sashes, through which a current of air flowed into the room, as was perceptible enough when the hand was placed over the lap.

"Shure, an' ye're an angel, Missus Camp; the blissid Vargin herself must 'av' l'arned ye to docther, fur Mickey darlint is the betther fur what ye've jist done alreddy."

"I'll come up in an hour to see how the patient is getting along. Perhaps, meanwhile the physician from the Dispensary will come," and Mrs. Camp opened the door to return to her own apartments.

"Musha, an' I don't care if he niver comes. Belike you're more knowin' in the faver than thim gintlemin," exclaimed the grateful woman, following her co-tenant to the stair landing. "Thin they gives their perscipshuns; an' wid their orders to do this an' that, how's a poor ignorant body loike meself to know what to do at all at all."

Before sitting down to her intermitted work, Mrs. Camp took a lemon which she had in her little kitchen pantry, and made a bowl of lemonade, moderately sweet, and took it up-stairs to her little patient. Giving him a spoonful or two, which he swallowed with the zeal which a famished kitten shows in lapping a saucer of milk, she left the bowl in the charge of his mother, and again returned to her own room, followed by a volley of thanks and benedictions.

The Dispensary doctor didn't come that night, but he did the next morning and found the boy much improved. "Only a slight attack; a mere touch," he said; "no medicine required; give him some oatmeal gruel, my good woman, and nothing hearty, for his stomach is deranged and weak, and I think he'll be up again to-morrow."

"Shure, sir, I'm of that moind," said Mrs. Moriarty to him as he was taking his brisk departure after a two-minute inspection of the patient. "Hadn't it a been for the leddy on the third floor, who's the best docther, savin' yer presence, sir, me two eyes iver saw, the faver wud 'ave gon' hard wid me Mickey. But it's thankful I am for yer comin' an' tellin' me sich good news, an' I'll jist do as ye say 'bout the gruel."

H. S. D.

(To be continued.)

HOW ENGLISH WOMEN SPEAK.

IN an article on English society which Mr. R. G. White recently contributed to the *Galaxy*, several points are illustrated in which the author draws a line of comparison between the ladies of England and of America. We quote a few paragraphs which are descriptive of the mannerism in voice and speech of the English women, and at the same time are very suggestive of the organic differences in mental constitution of the nations mentioned:

"The voices and the speech of English women of all classes are, with few exceptions, pleasant to the ear—soft and clear; their words are well articulated, but not precisely pronounced. They speak without much emphasis, yet not monotonously, but with gentle modulation. Their speech is, therefore, very easily understood — much more so than that of persons who speak louder and with stronger emphasis. You rarely or never are obliged to ask an English woman to repeat what she has said because you have failed to catch her words.

"This soft, yet crisp and clear and easily-flowing speech, is, as I have said, common to the whole sex there. I was reminded of this when, one morning, at a great house, a country seat, I lingered with my hostess at the breakfast-table, after all the rest of the family had risen. She touched a bell, and a maid, an upper servant, answered the summons. No servants, by the way, wait at breakfast there, even in great houses. After you are once started, and the tea is made, you are left alone, to wait upon yourselves—a fashion full of comfort, making breakfast the most sociable meal of the day. When the maid appeared, the lady spoke at once, and the servant stopped at the door and replied, and there was a little dialogue about some household matter. The young woman's answers were little more than 'Yes, my lady,' and 'No, my lady,' but I was

charmed by them—more so than I have ever been by a lecture or recitation from the lips of one of the sex. She spoke in a subdued tone; but every syllable was distinct, although she was at the further end of a large dining-room. Her mistress' voice was no less clear, and sweet, and charming, and as they talked, in their low, even tones, with perfect ease and understanding at this distance, the whole of the great room resounded sweetly with this spoken music.

"When English is spoken in this way by a woman of superior breeding and intelligence there is, of course, an added charm, and it is then the most delightful speech that I ever heard, or can imagine. Compared with it German becomes hideous and ridiculous, French mean and snappish, Spanish too weak and open-mouthed, and even Italian, noble and sweet as it is, seems to lack a certain firmness and crispness, and to be without a homely charm that it may not lack to those whose mother-tongue is bastard Latin.

"One reason of this beauty of the speech of English women is doubtless in the voice itself. An English woman's voice is soft, but it is not weak. It is notably firm, clear, and vibrating. It is neither guttural nor nasal. While it soothes the ear, it compels attention. Like the tone of a fine old Cremona violin, its softest vibrations make themselves heard and understood when mere noise makes only confusion. Such voices are not entirely lacking among women in America; but, alas! how few of the fortunate possessors of such voices here use them worthily! For the other element of the beauty of the English woman's speech is in her utterance. 'Her voice is ever soft, gentle, and low: an excellent thing in woman.' Shakespeare knew the truth in this, as in so many other things. One of the very few points on which we may be sure of his personal preferences is that he disliked high voices and sharp speech in women. Singular man! I fear that his ears would suffer here. The English woman's voice is strong as well as sweet, but her speech is low. She rarely raises her voice. I do not remember having ever heard an English woman try to compel attention in that way; but I have heard French and Spanish and Italian women, ladies of unquestionable position and breeding, almost scream, and that, too, in society. Nor does the English woman use much emphasis. Her manner of speech is calm, although without any suggestion of dignity, and her inflections, which rise often, although they are full of meaning, are gentle. I remarked this difference in her speech of itself, but much more when I heard again the speech of my own countrywomen. I had not been in their company five minutes—not one—when I was pierced through from ear to ear. They seemed to me to be talking in italics, to be emphasizing every word, as if they would thrust it into my ears, whether I would or not. They seemed to scream at me. They did scream. I am sure that to their emphatic and almost fierce utterance is due, in a very great measure, the inferior charm of their speech when compared with that of their sisters who have remained in the 'old home.' If they would be a little more gentle, a little less self-asserting, a little less determined, a little more persuasive in their utterance, as well as in their manner, I am sure that, with their other advantages, they need fear no rivalry in womanly charm, even with the truly feminine, sensible, soft-mannered, sweet-voiced women of England."

TRY HIM ONCE MORE.

His case looks bad, I own, sir, very bad;
But let's try hard and save, not crush the lad;
He feels his guilt, e'en to the heart's deep core.
Try him once more.

Deal with him, sir, this tender, erring one,
As you would have another serve your son;
Youth is impatient—'tis the first offense;
Send him not hence!

If you forgive him now, and hide his shame,
'Twill fire his heart, perhaps, to earn a name,
And show his gratitude as ne'er before.
Try him once more!

He seems a likely lad—his eye is bright,
His limbs are lithe and pleasant to the sight;
Let him go on, sir, still in your employ;
Pardon the boy!

Give him good counsel, in a gentle way;
Tell him the story of your boyhood's day,
Recount your victories and temptations o'er;
Try him once more!

A prison cell would never better things,
For self-respect and hope might then take wings.
You say yourself it is his first offense;
Send him not hence!

As years pass by, and he becomes a man,
Guided, it may be, by your own wise plan,
These words may greet you at life's common goal:
"You've saved a soul."

POOR TOM--A PHOTOGRAPH.

WHAT a restless, eager-eyed, uncomfortable mortal this was! and how naturally his friends saddled him with that unfortunate epithet, "Poor Tom!" They used it oftenest, too, when his schemes were the grandest and his hopes highest on the wing.

"Poor Tom is making his fortune again;" "Poor Tom has hit it this time," they would say with such gentle pleasantry as poor Tom himself could scarcely have resented. No one was ever hard on him. He was spoken of, at the worst, with a sort of indulgent pity. It is true that he did "hit it" sometimes, and gloriously; but those who knew his history thought it might have been better had he missed it always, for his good luck only served to set new snares and dig new pitfalls for his unwary feet.

Success and Fortune were his watchwords, and never was man so persuaded that the world was his oyster. He was an inventor—not because he delighted in mechanics, but because by this door men have entered into wealth. Conceits that another and saner man would have blown away with the breath of a laugh, entered into his brain, and came forth physical marvels. It is said, by those who should know, that some of these inventions found their way to the shelves of the Patent Office. Certain it is that they have never been heard of elsewhere.

Poor Tom was a merchant also—not for love of traffic, but because there have been merchant-princes; and debt and disaster ended that phase. He was an editor—a zealous, prejudiced, partisan, sledge-hammer, one-ideaed sort of an editor, and might have lived and died triumphant in that career, but—we know the fable of the dog who dropped the substance for the shadow—he saw something more brilliant, more enticing, this poor dog of a man, and let meat and fame go down the stream. Failure never daunted him, for the new prospect was ever opening before the last closed. He learned nothing by experience. His Hope ever lighted up fresh vistas. The past was to him a dull and barren book. Only on the pages of the future spread those pictures in which his fancy reveled. It was nothing to him that he carried others with him to his ruin. Mother, sisters, wife, children, too-confiding friends—one and all were to be enriched by his dawning fortunes, and live with him in a heaven of prosperity thenceforth forever.

Then, too, there was self-esteem, and his belief in himself extended to every affair of life. Nothing was too difficult for him to undertake; nothing could fall short of his anticipations. His wishes were facts accomplished. An affectionate disposition had poor Tom, especially where the gentler sex was concerned. In his early days he loved every pretty girl he met, and, indeed, he never changed much in that respect, only that latterly he called his affection fatherly. Young or old, he never suffered the sorrows of concealment. His vows and promises were poured like water, and the habit got Tom into serious trouble more than once. Another man in such predicaments would have been called a scoundrel, but he was only following the impulse of organization. At length one woman avenged the rest. Tom's first matrimonial venture was a speculation not to be ignored or laid upon the shelf, and it was pretty well known that the wife who had won her husband by virtue of superior tenacity was a perpetual thorn in his side.

Tom's disposition, however, was hard on wives. It wore out two more after this first, and then Tom began to wear out himself—not that he was in the least aware of the fact. Rheumatism and all the messengers of old age warned him in vain, and death at last took him by surprise. He

could not believe that he must go before he had brought his last new scheme to a triumphant close.

He was a sanguine man—poor Tom! Had he been a sanguinary one he could scarcely have been more of an enemy to all connected with him. His life was a long, hot, wearing, turbulent fever, and now "poor Tom's a'cold."

HARRIET IRVING.

"FOLLOW THOU ME."

A DESERT, a shadeless desert;
Oh, wildly the storm doth sweep!
And I bury my unprotected head
In the pitiless sand and weep.

The wild winds sweep around me,
Moaning, in hopeless song:
"'Tis nothing but sandy desert
Forever and ever on.

"No shady land of peace
Will gladden your heavy eye.
Oh, give the hopeless journey o'er,
Rise not—lie here and die."

But a ridge o'er the sandy desert—
A *track*, o'er the dusty plain,
Sends hope to my fainting heart,
And I start on my journey again—

For I know that One before me
Hath travelled the desert o'er;
Thank God! for that print in the giving sand,
Where a foot hath trod before!

MRS. ELIZABETH THOMPSON.

THIS lady has the indications of strong vitality and excellent health; her breathing power, and circulatory and digestive functions appear harmonious, and each equal to the production of good results, for the health of body and mind. There is also a large brain, and it is well developed in the three great centers, viz., the intellectual, the moral, and the social. The selfish realm is not so strongly marked; the side-head not so fully developed as might be desirable. We think that there should be more of the love of gain, a stronger element of self hood in respect to finance and the possession of property. She is inclined to think for others and to live for them, not only physically and mentally, but financially. She bears the burdens of other people upon her pocket as well as upon her heart. She has not quite enough Destructiveness to modify her strong Benevolence, and enable her always to do justly by those who deserve severity. She is apt to compromise toward beneficence. When justice demands thoroughness and executiveness without clemency she sometimes fails to meet the issue.

She has a tendency to be intellectually rather than physically pugnacious. She would, in training children, preach a good deal of that which is just and proper, and might threaten to punish in cases of impropriety, but she would not incline to apply severe punishment. Yet delinquency on the part of those who owe service or obligation is looked upon by her with no lenient spirit. She has a feeling that wrong is very wrong, that injustice is thoroughly unjust, but she mingles mercy with justice in such a way that the delinquent generally gets off without suffering.

She has firmness enough to continue, to persevere, and to hold out in her enterprises. She has large Hope, and looks for the good time coming, and is able to encourage those who feel ready to perish, who are despondent, who lack cheer and good expectation. She brings sunshine to such, and opens a vista of good things to come. She has faith in the good time coming, and in that

which is superior to the joys and remunerations of earth; and though there are few persons who enjoy the present life as well, or who affiliate with more sympathy and pleasure with friends and society and all that makes life pleasant and desirable; yet she has a thought that there is something

better than three meals a day, something better than all we know or appreciate here.

Her Cautiousness is exercised largely in behalf of others. She is always watchful for other people, and is very apt to be giving admonitions of care and solicitude; but does not borrow trouble much herself. If she should expect to go away two weeks hence, she would begin to lay out things which are to be wanted, but would do her packing up in the last two hours she had at home. Her caution gives her the forelooking tendency to provide for that which is coming, and thus she gets preparation made to get away, and never leaves anything out of the question that will be desired. If she were a housekeeper, sick or well, she would know where everything was in the house, and where it could be found. She could manage business, but she has not quite enough fiscal wisdom to manage business, on what are termed business principles. She does not like to think people are dis-

honest and treat them as if they were rogues, and therefore she is sometimes compelled to suffer wrong rather than do what to her would seem to wrong others.

She has talent for literature, and if she were educated for writing or speaking, she would succeed well on the platform, on the stage, or in the editorial chair. She is a natural teacher; can communicate what she knows in such a manner as to make it understood; and people, if she wishes to speak, are willing to hear what she has to say; and if they do not quite believe it, they will treat it with becoming respect.

She reads character well, and generally knows how to adapt herself to others, and rarely makes a mistake in estimating strangers, unless it is to think they are more honest and more just than they are; but the general outline of their character she will recognize at a glance.

Obituaries are unsatisfactory. They merely serve to awaken us to a grieving sense of our loss; to a knowledge of the removal of some person whose characteristics or mode of life might have served us with an unending fund of benevolence, entertainment, or worthy example had we but known of his or her existence. Contemporary notices of persons of distinction are of frequent occurrence in the ordinary literature of the day. But it may be said that trustworthy reflections of the career of a living person who claims the respect of the community are not frequently published, so that society is to a large extent kept in ignorance of many of the odd and original characters which surround them on every side. Most of those whose character, culture, and accomplishments have rendered them worthy of public consideration are difficult to approach, so that the would-be interviewer or reporter can not if he would make use of them in his off-hand liberal manner. One of these is the lady whose portrait is given in this number, and of whom this sketch is written.

Mrs. Elizabeth Thompson is the great-granddaughter of the brave Hannah Dustan, and a relation on the maternal side of Pocahontas, the Indian Princess, whose place in early American history is prominently interesting. Samuel Rowell, father of Mrs. Thompson, was the son of one of the seven children who fled with their father from that cottage in Haverhill, in the old Colony of Massachusetts, when attacked in 1697 by a band of Indians. It will be remembered that Mrs. Dustan, her infant, and Mary Neff were left to the barbarism of the savages. The subsequent heroism and marvelous escape of Hannah Dustan and Mary Neff, laden with the scalps of their ten persecutors, are a household tale, and familiar to every American school-boy.

The childhood of Elizabeth Rowell was passed in the wilds of Vermont, and from the earliest years of her life, she was distinguished for traits of sympathy and kindness. We are told that the suffering of an injured bird or animal called forth not a mere display of pity and grief, but a tempest of agony which was divided between the object and the subject of the misery. As years went on, this peculiar sympathy took on the range of devotedness to ministering to the wants of the needy. According to her ability, and much beyond it at times, have been her acts of benevolence both mental and material. Could they be collected they would fill volumes. Through her efforts students have been educated to posts of honor and trust, schools have been founded, colleges endowed, the weak and diseased provided with comfortable maintenance, the culprit removed from prison to a region where he could redeem the waste and shame of his former life, the desperate and oppressed reclaimed and held to the law of right and duty. In some cases she has gone so far as to take a poor victim of want or harsh treatment, who had thrown herself into the vortex of ruin, to her own house, and kept her there for weeks until proper employment had been obtained, and the girl or woman thus substantially assisted toward the recovery of her womanhood and a life of usefulness.

Two or three gentlemen now occupying

good positions in Boston society were, in their hour of distress, supplied by Mrs. Thompson with the very necessaries of life and given the assistance necessary to start them on again in the world. Here is another instance of her method or lack of method: Fifteen years or more ago she visited a brother-in-law residing in a Vermont village; while there she learned that there were no school advantages afforded the children of the place. Her brother's little flock participated in the need. At her own expense she supplied a teacher, not only paying her salary, but also her board for two years. She believes most earnestly in educating the masses of the people. She believes in the efficiency of the newspaper as an educational agent; therefore she supplies seventy-five or a hundred families with as many newspapers and periodicals yearly.

She has interested herself in behalf of the miserable and unfortunate, not because she was desirous of applause, but from the very nature and impulse of her organization. In some cases even those who have been helped by her and saved from starvation, have said of her, "That woman is insane on this matter of benevolence." By consulting the books of manufacturers, it has been ascertained that during our late war, thirty sewing-machines at least were presented by Mrs. Thompson to the widows of soldiers who found themselves suddenly called upon to support their families; not to mention the houses and suites of rooms which have been rented and comfortably furnished for the same purpose. It was through her marriage that the liberal means were obtained for carrying into practical effect her schemes of charitable doing. Mr. Thompson was a gentleman of liberal education and cultivated taste, and in the lady who became his wife he found an appreciative and devoted companion; not only appreciative as regards the moral and social obligations subsisting between herself and the community, but also in the way of intellectual improvement, and the study and reflection essential to it. It is said that Mr. Thompson's interest was awakened by seeing Miss Rowell perform a rather odd act of kindness. He occupied rooms in the Tremont House, Boston, opposite the building where Miss Rowell resided. She was then supporting herself by sewing. While at her window one day she saw a drunkard in the street who was struggling under embarrassing circumstances with his hat and a pair of dirty boots. He had dropped the boots, and in the effort to pick them up his hat had dropped off, and in the attempt to recover his hat he would drop one or both of the boots. Without a thought, she rushed down into the street and assisted the unfortunate man to get full possession of his property, and conducted him across the street. This incident of practical zeal for unfortunate humanity impressed the wealthy Thompson so favorably that he sought an introduction, and after a brief acquaintance married the young lady.

Before his death Mr. Thompson had devoted his estate, which was valued at over a million, to the establishment of a fund for the benefit of working women; the income, however, of this fund was to be at the disposition of Mrs. Thompson, who had advised this charitable measure, during her life. The will brought on a sharp, severe litigation on the part of certain relations of Mr. Thompson, who deemed themselves slighted or injured by his neglect in not making some provision in their behalf. However, Mrs. Thompson has continued to receive the income, and the final settlement of the contest will come after she has left this mortal scene.

In the great Boston conflagration, a considerable part of her property was destroyed. Shortly after the occurrence of that terrible calamity, her friends urged her to telegraph to her trustee, and ask him the extent of her losses. Instead of such an inquiry, the following message was dispatched: "Are my tenants suffering? If so, provide for them."

"There is only one woman in the world who can so far forget herself at such a time," exclaimed a well-known judge upon hearing of the telegram, "and that woman is Mrs. Elizabeth Thompson."

The International Woman's League, which has its representatives in many different parts of Europe and America, owes its

existence largely to the bounty of Mrs. Thompson.

A few years since, she gave much attention to the establishment of a free training-school in this city, and expended much money in the effort. She has also taken a deep interest in starting and furnishing free reading-rooms in many different places, associating them where she could with the district schools.

She has been something of a colonist. Six years or so ago she bought three thousand dollars worth of land at the foot of the Rocky Mountains, in the region known as Longmont, twenty miles from Denver. There she erected a large building for social and public purposes, and set on foot such other measures as would tend to attract the attention of settlers. People commenced to flow thither, and a little town soon nestled at the spot. Two years after, Mrs. Thompson visited the place, and found a library, bank, school-house, newspaper, and other evidences of progress had sprung up, and a population of about five hundred had accumulated there. It may be said that she sustained the Women's Free Medical College of this city for three years, contributing five thousand dollars toward its expenses. And many other institutions of prominence in this country which are doing excellent work in their several spheres can testify to her generous interest.

She has paid for the maintenance of whole families that have become reduced by stress of fortune or the hard times, until their heads were able to carry them again. In some instances she has taken the destitute husband, wife, and children into her own house, and fed and clothed them for months. One family, somewhat prominent in the educational lines in this city, was maintained for a year and a half at a cost of nearly two thousand dollars.

Her benevolent enterprises have cost Mrs. Thompson upward of half a million of dollars, but she appears to reckon nothing of the expense so long as some good proceeds from the use of her money. She has given upward of fifteen farms to persons whom she deemed worthy of such gifts.

At the present time this lady is devoting herself with much vigor to the solution of the labor troubles of the country. She aims at the organization of a Labor Society which shall promote industrious and frugal habits among the masses

She has little sympathy for charitable institutions *per se*, but believes most earnestly in affording employment to those who are able to work, and so helping them to provide for their own support.

The indiscriminate and promiscuous giving of society she thinks has gone far enough. And the country now labors under a burden of poverty and wretchedness which demands the attention of Government. And she intends to bring the matter to the notice of our national authorities, if it be possible.

As a general thing, instead of lavishing aid upon those enterprises which have been long established and are well-known, she has sought out and aided those original organizations which in this country have found but little appreciation and patronage. It is said that Mrs. Thompson, in spite of what would be deemed by most observers a benevolent mania, is not an enthusiast even in the direction of the liberality which she constantly manifests. She preserves the balance of her mind in the midst of constant solicitations and enticement to aid unworthy objects.

YOUTH, like everything else, must be cherished, not squandered; and if we waste it in frivolous dissipations, age will come before years. The faster we travel the sooner will we get to the end of our journey. Enjoy youth in every reasonable way whilst we have it, but always remember that every time you overdraw on it you are contracting a debt that must be repaid, with heavy interest, in the future. Retain youth as long as you can, neglecting nothing which will assist you in doing so, but scorning everything which is false or deceitful.

Department of Literature, Science, Education.

True philosophy is a revelation of the Divine will manifested in creation: it harmonizes with all truth, and can not with impunity be neglected.

HOME FROM COMMENCEMENT.

NOT only am I just home, but I am full of readings about Commencements; and I propose to jot down, for the PHRENOLOGICAL JOURNAL, a few things suggested to me by what I have so recently seen and read.

I. I will begin with the little matter of the word Commencement. It is really the close of the college year, and the time when the senior class graduates and leaves the college, yet it is called commencement. It is only the beginning of vacation. When we attempt to show some folks that a word in the Bible is not to be understood literally, they regard us as attempting to deceive them. Let them be instructed by the word named, that a word, used by learned and ignorant, may come to have a unique, a far-fetched, or even reversed signification.

II. Colleges, like everything else in modern life, are penetrated through and through with the influence of the press and of public sentiment. Exclusive and isolated institutions belong to the past. I do not mean to say that our universities are thoroughly modernized, but I do mean they are undergoing the process. I heard an oration, by a senior, on Physical Morality, and another on Conservation of Energy in Life and Mind. Such topics as Commerce and Civilization, the Scholar and the State, the Morals of Trade, the Progress of Chemistry, chosen by young gentlemen for graduating themes, show that our seats of learning are losing monastic isolation, and being flooded by the uprising waves of popular and general interests. The college is reflecting the outside world, and the world is seen directly from its windows.

These seats of learning have their papers, their societies, their discussions, boat-clubs, and the students smoke (poor business) as freely as other folks. It is very difficult for the Faculty to maintain anything the majority of the students object to. Liberty and democracy have entered the university. Man-worship is on the decline. Tradition has less and less authority. The elective system, which a phrenologist instinctively favors, is prevailing. The President of Harvard, I am told, advocates it. President Capen, of Tufts, in his last report, says:

"The range of electives, which was considerably enlarged last year, has been still further enlarged this year by the addition of chemistry in the Junior year, and of jurisprudence, chemistry, and physics in the Senior year. The more general recognition of the elective system in doing the work of the college is a forward step. It meets with approval in every quarter. The students like it because it not only enables them to pursue with especial profit studies to which they are attracted by inclination and capacity, but because it saves them from wasting their energies upon departments in which they can make no very marked progress. The quality of instruction is improved by breaking up the classes into small sections, and bringing the men directly and constantly under the influence of the instructor."

I listened to an oration, by an editor, before an Alumni Association, which was a graceful plea recommending a department in the course of study for designing, engraving, painting, sculpture, etc., his theme entitled "Æsthetics are a part of Education." It was highly approved. So the world moves. President Chadbourne has made the important admission that all men are not naturally fitted for a collegiate course

of study. Movement again. He might have also said that it is not the duty of every young man who has scholarly tendencies to crowd himself through four years of study. He may not have the health, or the means, and Providence may throw such cares upon him as morally forbid the "liberal education." Sacrifices are sometimes made to secure it which ought not to be made. Knowledge and culture are usually within legitimate reach of all who hunger for them, but graduation may not be. The expensiveness of modern life in general is reproduced within classic apartments. Twelve hundred dollars, I remember, would take a young man grandly through four years of study; now, it must be doubled. Most of the four hundred colleges in the United States are calling ingeniously and earnestly for bestowments, not, however, in the interest of indigent students — rather that there may be more professorships and additional facilities.

III. The study of Latin and Greek yet takes years of a liberal education. In a few years, those graduates who do not teach these languages will have forgotten them. Modern languages are now added to the curriculum, and it is otherwise enlarged. To try and commit to memory all the declensions, conjugations, poetic feet, irregular verbs, and so on, of dead tongues, is a vain and pretentious affair. No themes at the present hour need elucidation more than these: Man is Finite, and Life is Brief. Were a teacher to insist that a class in geography should commit to memory the exact boundary of every town on earth, parents could see the absurdity of the injunction. They do not see the absurdity of some other things just as chimerical. So children and older pupils have to endure tasks that will astonish the teachers of a more tender and philosophic generation yet to be. An able editor, writing of women's colleges, says, when speaking of the last year of Smith College, "Health and happiness prevailed." The same paper had previously reported, "The second year has abundantly confirmed the experience of the first, that American young women are capable of pursuing the highest course of study without impairing their health." I can not speak from observation of the members of this college, but I made such quotations recently, to a company of ladies, convened from different institutions, and they responded that, as a rule, lady students were neither robust nor happy. They ought to be, but before they will be, health must be more venerated than it is now. You may see a whole class of young men graduate, without beholding more than one or two specimens of perfect physical integrity, or not even one such. When we appreciate the physical as the Greeks did, then, and not till then, shall we vie with them in beauty and stamina. When a young man becomes a member of a base-ball or boat club, it is far from certain that he will thus add to his material force or longevity; such an important matter as our material well-being is not to be fully insured only on a very comprehensive and well-balanced plan.

IV. That intercommunication between the schools of the country and the world outside, complete almost, should be even further perfected. It was a sad thing for our land, to leave the fate of the nation in the hands of politicians, with all their selfishness, pride, and temper. The legislation of the people must outrun Congress. The correspondence now going on between the North and the South is more healing than any Act of Congress could be. So the general wisdom and progress must shine in at every door and window where the young and younger are taught. Educators even are not to be left uninspected. It is too much thought that going to college is going to another and higher world. We are all in one round car. Those professors who publish to the world the lectures delivered to students are to be thanked on the ground of comity and democracy alone. It seems very apposite that I should find in the PHRENOLOGICAL JOURNAL, "Letters to a Son in College." Whoever *Pater Confidens* may be, it is a wise son who heeds his parental sayings. Next, let us have, letters from the son. In other words, students should sometimes write for our publications, as well as edit papers pertaining to college life. The latter are a new and promising feature.

V. Any one who has this summer read and heard much of baccalaureate sermons, alumni addresses, graduating exercises, etc., and pondered upon them, I think will agree with me, that all speakers are beginning to feel that they have a world for an audience, instead of a portion of it; that sense and usefulness have been deeply considered, and that no literary season before ever brought forth so much adapted to and worthy of general circulation. The press has shown its popular instinct in largely serving the public with these popularized utterances. Let the assimilations go on.

VI. The graduate whose English oration was on physical morality—a fine fellow too—gave the only fling at phrenology I have detected. His argument had necessarily carried him on to that territory. He virtually apologized by quoting Dr. O. W. Holmes' witticism about the rivet heads of the boiler. When the mirth is over, no fact is left, as the graduate can easily ascertain. By the way, I have recently read in a quarterly for July, current month, an able sketch of Dr. Whittemore, by Dr. E. G. Brooks, of Philadelphia, in which the reviewer, on pages 286, 287, distinctly refers to phrenology in explaining Mr. Whittemore's peculiarities; quotes, too, the remark of a phrenologist, and does this without apology. From personal observation, I judge the size of the base of the brain in Thomas Whittemore's case, though large, is rather overstated; the courage and manliness of Dr. Brooks appear in a noble light all the same, himself a cautious and devout theologian. Franklin County, Mass.

THE STEREOSCOPE AND ITS PICTURES.

MAN possesses, besides reason and skillfulness, imitation. He is not satisfied with enjoying the works of nature only, and making use of them for purposes of profit; he endeavors also to copy, to imitate the form of whatever he sees; and this is done either by producing the object in a true copy, or in attempting to obtain an ideal—a perfected form of the natural. The painter selects a certain point, and copies the objects as they present themselves to his view from that point, regarding only height and breadth of the surface. In this way he gives us, on a small scale, a large piece of nature; but however he may try to supply depth by a correct application of perspective and a skillful distribution of light and shade, the viewer, assisted by his faculties of combination, will only be able to imagine the real effect of the picture, and will never feel this effect in the same manner as he does in viewing nature herself. This does not depend upon variations of the point of view, but upon the construction of the organs of sight and perception, which enable one to distinguish flatness from solidity

One eye, to be sure, is able, through the cultivation of the faculty of Accommodation, to judge if things lie in one plane or not, and to estimate, involuntarily, the relation of distance of the object from its own point of view.

But how much easier and better are we enabled to judge of nature with two eyes, each forming its own picture of the object, and the axis of each picture having such a direction that its light falls on a corresponding point of the retina, and so both unite in a common image. The least deviation of the look from one point to another must change the direction of the axes of the eyes, and, therefore, we can never at the same time observe clearly more than one point of an object.

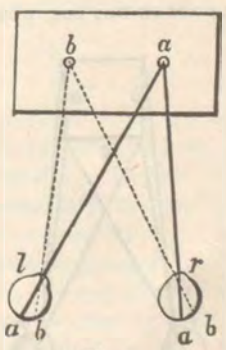

Fig. 1.

If we hold a piece of paper directly before

us and observe thereon two marked points, as *a* and *b* (fig. 1), the image of the point *a*, on the retina of the left eye (*l*), will cover the image of the same point on the retina of the right eye (*r*); the point *b* will appear in the left eye in a certain distance aside in-

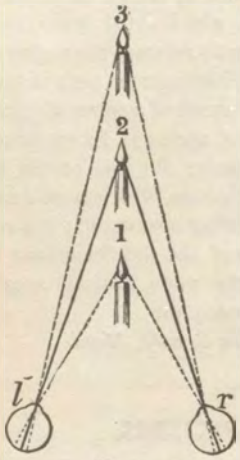

Fig. 2.

distinctly, and is also visible to the right eye in the same direction and distance from *a*, therefore in the corresponding place.

If we take three candle-lights and put them in a straight row, so that the connecting line, when extended, would fall half-way between the eyes, then one eye, placed at a point on this line, would see only

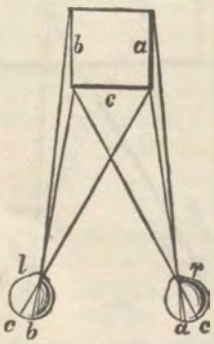

Fig. 3.

one light, because the light number 1 covers the lights 2 and 3 (fig. 2). Now, in reality, as they are placed, both eyes look sideways on the three lights, and each eye sees distinctly all the three lights; but each has a different view of them, while only the picture of one and the same light is congruous on the retina.

On a single object, as in fig. 3, the same appearance is observed; its image is not the same in both eyes, but when both eyes see the front, *c*, the right eye sees, besides, the right side of the object for itself, while the left eye sees, in the same way, the left side. Thus, by means of both eyes, seeing two pictures of the same object, is chiefly the reason that objects appear to have depth as well as height and breadth, and are not flat, but solid.

Now, therefore, how can we produce a most deceiving portrait of things as they present themselves in nature? How could we combine, with the advantages of paintings, the only thing in which they are defective, the plastic effect? Evidently, if we

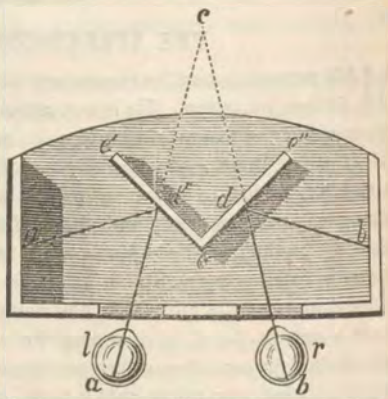

Fig. 4.

could produce two views of the same object, as they are perceived by each of the eyes, and if we could bring these two views upon the corresponding point of the retina, they would produce, in combination, the same plastic impression on the visual nerve as nature does.

The English physicist, Wheatstone, was the first who endeavored to confirm this conclusion by experiment. He prepared, from a simple body, two different views corresponding with those obtained by the right and the left eye, and placed them before the right and left side-wall of an apparatus (*a* and *b* in fig. 4); in the back part or center of this apparatus were two looking-glasses set at right angles (*e*, *e'*, *e''*) to each

other, which, according to the laws of reflection, will throw the image of the objects *a* and *b* to corresponding points in the right and left eyes (*r*, *l*). The experiment proved a success; the two views were united and produced a striking effect, and the images formed seemed to be one situated in a common point *c*.

Wheatstone's apparatus, known as the "Wheatstone Stereoscope," exists only in physical manuals. Sir David Brewster's invention, the Stereoscope, as it is known to the world, has taken its place. Through the two glasses (*o*, *o*) in the box represented in fig. 5, which is usually about seven inches long, half as wide, and two inches deep, the eyes look on two pictures, *a* and *b*; a partition wall through the middle of the box provides that each eye shall see only its corresponding picture. The eye *a* will see *a*, and the eye *b* will see *b*. The inner walls of the box are blackened to offset all disturbing secondary lights. In order to facilitate the covering of the pictures to the eyes, the glasses *o*, *o* are cut out of the two halves of a double convex lens, and placed with the sharp ends toward each other, so that the pictures *a* and *b* will be transmitted to the eye, not in a straight, but in a deviated line. The eye axes will thereby be turned more toward each other; the picture will fall on the corresponding points of the retina, and one thinks he sees the real object in the line *c*, *c*, in which the eye axes cross each other. The effect is so much

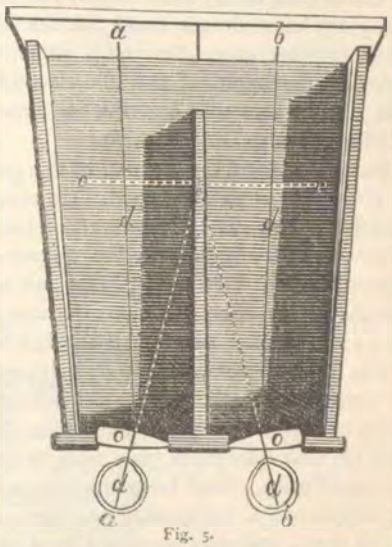

Fig. 5.

more surprising as the supposed picture appears nearer, and respectively larger since the glasses, *o*, *o*, as parts of a double convex lens, produce a magnifying effect.

WILL DOERING.

HOPE AND DESIRE.

"What's i' the air?
Some subtle spirit runs through all my veins;
Hope seems to ride this morning on the wind,
And joy outshines the sun."

PHILOSOPHERS in their examination and classification of the sensibilities have sometimes confounded Hope with Desire, the wish with the expectation, the dreamy longing with the bright anticipation, but they have thus fallen into a grievous error, and caused much confusion in the mind of the student in mental science. Both relating to something future, yet they are generically similar, and specifically dissimilar, like sisters who resemble different parents, or the bud and blossom on one vine mingled and intertwined among the same leaves. Desire has always reference to something unattained, which it believes to be agreeable; but can only lay upon it the indistinct claim of possibility. There is nothing to insure its possession but the longing for it, no bright star of promise between it and us, no faithful harbinger lingering over it. When we come to Hope, however, there is no longer only the possibility, but the probability, to call the coveted object our own. The emotion of Hope is ardent or otherwise, in proportion as we deem the object important, and in accordance with our love for it. We as constantly hope for pleasure as for the continuation of life, and yet we often passively wait for the former while we direct all our efforts to the attainment of the latter. The prosperity and freedom of our country simultaneously grow out of our love for it,

and yet we may trust the one to our fellow-creatures, while we sacrifice life and all that we hold most dear for the other.

Phrenologists give Hope a place by the side of Veneration, and were the grouping of the organs of the brain merely fanciful, surely the most devout could not select a purer, brighter atmosphere with which to surround the organ of spiritual devotion. The discovery of this organ in its cranial relation is due to Dr. Spurzheim.

Dr. Gall marked the function of this part of the brain as unascertained. He maintained that Hope is the attribute of every faculty, but falls a prey to the erroneous supposition that Desire and Hope are synonymous. Probably the more we have to hope for in life, the more happiness lies before us. The laborer, toiling from early morn till eventide "in the sweat of his face," seems to realize more peace and satisfaction from life than after years have brought him ease and luxury. Hard labor has ever been considered one of the greatest punishments of this world, and yet I wonder if the Creator's curse upon the first disobedient man was not a greater gift than any earthly benefactor can bestow upon those whom He would bless. It has long been a disputed question whether there is more pleasure in pursuit than in possession. If we acknowledge with the majority that the pursuit is the more pleasurable, is it not because after possession Hope has hid her bright, glittering face from us? Earthly possessions always come burdened with some trials and anxieties; and when there is no longer necessity to hope for what we deem will make us happy, we grow fearful lest our wealth be snatched from us, and thus our mind is agitated by the fear and dread of our previous state, when before it was cheered by the hope and desire of our present condition. God never smiled more graciously upon man than when He lighted the innermost chambers of his mind with the beacon-light of Hope and set it upon the watch-tower to throw its beams upon the workmen beneath. In early childhood it is the precursor of every good we believe the world to contain, and thus it is that this period of life is ever marked by joyousness, elasticity, and mirth, whether it be passed in hut or palace, in affluence or penury. In budding manhood and womanhood Hope builds great and dazzling air-castles, and holds forth fairest promises, strewing the winding path of life with gay flowers and graceful foliage; and when man has passed the flood-tide, descending into the shades of gathering twilight, Hope walks by his side and points beyond the misty veil that rises in the distance to new and deeper joys. Hope is universal and refulgent as the sunbeam, throwing its wondrous light about us when we court its presence, and haunting us with its brightness when we have secluded ourselves amid the shadows. In joy it glows and flashes; in peace it beautifully smiles; in despondency it gives a lustre to the dewy eye; in youth it laughs and sparkles; and in old age it patiently looks up to the Source of all light and love. We can not too fondly cherish this blessed boon that is strength to the weak, peace to the heavy laden, comfort to the afflicted, and life to the dying.

"Angel of life, thy glittering wings explore
Earth's loveliest bounds and ocean's widest shore."

G. A.

IN THE CHILDREN'S CAUSE.—Evil temper is more often caused by circumstances than a natural disposition; sometimes the cause may be a physical one, and the fretful child need a physician more than a rod. It is not always a lamentable sight to behold a child show temper; the very passion exhibits qualities extremely valuable; thus a child of active temperament, of extreme sensitiveness and earnest purpose is more likely to encounter opposition than a child of a dull, passive nature, and if his disposition be frank and open, void of all concealment, he will show his discomfiture by a burst of anger. Punishment only increases the trouble in this case, and probably changes the outward exhibition of wrath to a fit of sulks. Let the mother keep her own face cheerful, kind, and sympathetic, and the cloud will pass over sooner than if received with scolding and frowns. If possible, strive to keep away the stumbling-blocks in the children's path. Make them happy: they can not be too much so. Happiness is the sunshine in which all sweet attributes will grow. Don't be afraid of their being spoiled by it. Let us smooth the rough road for our little ones' feet. SARA KEABLES HUNT.

THOMAS COOK,

THE TRAVELER'S FRIEND.

AMONG the men of England who are worthy the respect of the American people, and of the people of any country, Mr. Thomas Cook should be given a prominent place. Aside from his admirable personal character, he is entitled to special consideration on account of the excellent work which he has done for the benefit, not only of communities, but also of nations. Devoting himself early in life to what has been gradually developed into a grand universal system—the providing of facilities for cheap and comfortable travel—he has acted the part of an international benefactor, assisting the peoples of different provinces and nations to learn of each other by personal observation; helping the invalid to reach the land where sunny skies and invigorating breezes promise the boon of health; speeding the poor emigrant on his way to the new country with trusty information and counsel; saving money and time to the man of business; giving safe conduct to the woman whom choice or necessity compels to cross seas or lands and mingle in strange scenes, and by whatever means which experience and practical judg-

ment could suggest to render the way of voyager and traveler easy and inexpensive.

A personal acquaintance with Mr. Cook of several years' standing has impressed us, just as all who have the privilege of his genial friendship have been impressed, that he possesses those warm, frank, considerate qualities of head and heart which must always win their way. And knowing him, we do not wonder at his great success in the conduct of a business as difficult and complex in detail as it is unique. Having at hand an estimate of his character prepared by Prof. L. N. Fowler, in which are woven a few facts of Mr. Cook's past life, we present it here as an exemplification of the close relation subsisting between the phrenological indications of the cranium and the expression of character in life.

"Mr. Cook has an organization that has enabled him to sustain himself in his peculiar line of life that he has originated, systematized, and perfected, till he has made a journey around the world as simple as a journey of a dozen miles was thirty-five years ago, before he commenced his labors.

"Mr. Cook's physical structure is symmetrical, compact, and powerful. He is of medium height, has a large head, neck, shoulders, and chest. He has good digestive powers, an abundance of arterial blood, a free and healthy circulation, a strong frame, and a vigorous muscular system, which was strengthened in the early part of his life by his taking much muscular exercise.

"Having a strong constitution as a foundation, his large brain has been well-sustained and nourished, so that his arduous and complicated brain-labor has not injured and exhausted his life-forces. His head indicates that he has no eccentricities, extravagant excesses, and deficiencies, but that he is characterized by evenness and uniformity of disposition. He derived his physical structure and planning intellect from his father, but inherited his moral and prudential qualities from his mother, so that he has both the masculine and feminine elements strongly blended.

"His energy of mind comes more from his strong constitution and excellent health, than from Destructiveness, for this faculty is not large, and when not stimulated by outside difficulties, he his mild and gentle; but opposition arouses his large Combativeness, and he then takes hold of his task with a zest, and is the last one to surrender. He is more courageous, however, in defending a principle than himself, and he has more moral than physical courage. He is never the aggressor, is cautious, restrained, and reserved in his normal state of mind; but when before an audience defending a principle he is self-possessed. In the field of action and in times of danger he is equal to the situation and to the emergency. In debate he expresses himself fully, freely, and forcibly. He has the talent to create and do almost any amount of business, but he is so intent on accomplishing his object and finishing his task, that he pays less attention to the making and hoarding of money than most men, and has accumulated because it was necessary to do so to carry out his purposes. His Acquisitiveness is not naturally large or active, and he has never been absorbed in money-making as such. The one ruling passion of his mind in his business is to create facilities, so that people can travel and see the world in which they live.

"He has none of the miserly spirit, but would prefer to let the whole world have the benefit of his philanthropic schemes, rather than confine his operations to a select few. He commenced working for the happiness of others as a missionary, rather than as a business man, to amass property. Experience alone has taught him to look after the pence as well as the pound. He has not a great amount of self-love, but a high degree of moral dignity and independence. His regard for fashion and display is not great, but he is very sensitive about his character, and can not bear imputations with reference to his motives. Conscientiousness is one of his largest organs, disposing him to adhere with great tenacity to what he thinks is right. He has the power to regulate his conduct, to live a uniform life under all circumstances, and while he can adapt himself to different people in all parts of the world, he takes his Conscientiousness with him, and allows that faculty to control his conduct.

"Firmness is very strongly developed. He

sometimes hesitates much before he decides which course he will pursue, yet when he has decided, and his principles are involved, he is unyielding, and perseveres till he has accomplished his purpose. The faculties of his moral brain are strongly represented, elevating his whole character, and inclining him to lead a moral and religious life. His large Benevolence, combined with his strong social nature, gave him his first impulse to start his present calling; for his first efforts were to carry temperance and Sabbath-school children and teachers to a neighboring town, and then he carried some poor working people who could not pay the regular fare, one hundred miles for one shilling each. This was for their benefit, without his deriving any pecuniary aid out of the scheme. The money that has been made in subsequent years from his numerous trips, has been the result of the combination of talent brought to bear rather than from his own greed.

"His moral brain, joined to his Self-esteem, disposes him to assume responsibilities that may promote the well-being and happiness of the masses who are unable of themselves to accomplish the same ends, and in this way he has done a great amount of gratuitous work, has encouraged many missionaries and schools, and has collected libraries for soldiers and others who had a thirst for knowledge, but had not the books to read and study, and he has helped many young men to secure situations of trust and honor. He works as hard when he receives no remuneration, as when he expects ample returns. I have traveled with him nearly ten thousand miles, and have seen him placed in many trying circumstances, but have always found him equal to the occasion.

"His reasoning powers are the strongest of his intellectual faculties, and they give him the ability and disposition to think, plan, reason, argue, originate, lay out work, and understand complicated questions. He thinks as a pleasure, but he observes as a necessity. His mind is very vigorous, and he identifies what he sees, for he looks with a definite purpose, and his memory is thereby intensified, but he remembers what he understands better than what he observes.

"If his perceptive faculties were larger, they would more easily introduce him to the external world, and enable him to gather more readily the special knowledge he may require. If he fail, it is in the details. He grasps the broad principles easily, but can not see all the minor points so readily. Great experience has enabled him to counteract this natural defect somewhat. His head is broad in the temples, and in the upper region of the sidehead. He is ingenious in many ways, not only in a mechanical direction, but in devising ways and means, and in extricating himself from a difficult situation. His ingenuity, joined to his large Hope and strong imagination, enables him to amplify, magnify, and embellish his ideas. He always presents the bright side of a subject, is happy, buoyant, and genial in his feelings.

"His Language is large, which shows to a good advantage when he is before an audience and excited by his subject, but under ordinary circumstances he his much more given to thinking than to talking. He has traveled in many foreign countries and around the world, and has been obliged to transact business in many different languages without being able to speak any but his own native tongue. His ingenuity has served him in this emergency, and he has adapted himself to circumstances that surrounded him with remarkable ease and pliability of manner."

Mr. Cook was born in Melborne, Derby County, England, in the month of November, 1808. He was a mere boy when his father died, and his mother, not being left in circumstances which enabled her to provide for the support of the family, he was compelled to find employment at ten years of age. He went into the service of a market gardener, and continued in that occupation till he was sixteen years old. Then he was apprenticed to the business of wood-turner and cabinet-maker. He was thus employed until he had reached his twentieth year. Home training had strengthened a natural disposition to religious and charitable work, and while a young man he would give a great deal of time and service in such directions; and, in fine, exhibited so much aptitude that he was engaged by a village missionary association,

connected with the Baptist church, of which he was a member, to go into the district of his native county as a tract-distributor and Bible-reader for the poor. He continued in the prosecution of this sort of religious work for four years, when the lack of support, on account of the weakness of the association which had engaged him, compelled him to return to the work-bench of his trade. For the next ten years of his life he devoted himself to this industry with all the energy of his nature.

Meantime, the temperance movement had commenced in England and Mr. Cook's sympathies became interested, and he warmly went into it, as an advocate of the reforms which it taught. While he was engaged in this way, he began that career of usefulness which has made his name famous by what might be termed an experiment. He made arrangements for a large party to go to a temperance meeting, some eleven miles from Leicester, the place of his residence; subsequently, he undertook the management of trips to Derbian neighborhoods. On one occasion, he created a great sensation by taking three thousand in one day. In 1845, he set on foot a series of excursions of considerable range, opening out the mountainous districts of North Wales to the appreciation of the English masses. In 1846 his arrangements were completed to Scotland, where, as fast as railroads were completed, and other arrangements organized, extensive systems of tours were planned. Subsequently he took into his plans the continent of Europe, perfecting plans by which Germany, France, Switzerland, and Italy could be visited at a moderate expense and in a satisfactory manner.

In connection with the great exhibitions of England in 1851, of Ireland in 1853, of France in 1855, and of London in 1862, he was actively engaged for the accommodation of the traveling public. Under his arrangement, 15,000 people visited Hyde Park in 1851. In 1862, he not only provided traveling arrangements, but also provided temporary homes for people in London. In this way he accommodated, under his own exclusive management, more than 12,000 persons. In 1866 we find him negotiating with the great ocean lines, and with the American railway companies, having in view the extension of his system of excursions and tours to and through the different parts of the United States and Canada.

His combinations penetrate not only into the remote regions of Asia, but may be said to surround the world. In 1872 he conducted a party which made a tour completely around the world. He has traveled from 25,000 to 30,000 miles every year, for upward of 35 years, and five millions of people have traveled with his tickets.

Mr. Cook has shown a deep interest in America and its institutions for many years, and probably no man in Great Britain sympathizes more with the political and social movements in progress here. Last year he showed a deep concern for the success of our Centennial Exposition, and as an evidence of his zeal, went to great personal expense in order to contribute to its attractiveness.

Mr. Fowler says of him: "Without having a fortune to scatter broadcast, he has been one of the greatest benefactors that England has produced in this century, and there are various reasons why he can take rank among the philanthropists of the day." Some of these reasons are embodied in the fact that through his enterprise as a planner of excursions and tours, "he has helped to wipe away the cobwebs of superstition and ignorance from the minds of thousands; has encouraged tolerance and brotherly love; has induced thousands of people to break up their monotonous habits and go forth to other lands, to get fresh air and fresh ideas, and thousands have been benefited physically, as well as mentally, in this way. He has taught Englishmen that there are other parts of the world worth visiting besides their own country, and enabled them to take broader views of humanity than would have been the case had they remained at home."

The gods bestow not equally on all
The gifts that men desire—the grace of form,
The mind, the eloquence. One man to sight
Is undistinguished, but on him the gods
Bestow the power of words.—HOMER.

INDIA--ANCIENT AND MODERN.

THE ancient religion of India, taught in the holy Vedas, by Manon, before it was corrupted by the Brahmin priesthood, admitted but One God—Him who exists by himself, who is in all, because all is in Him, the spirit alone can comprehend Him, He being without visible parts, eternal, the soul of all things, and whom none can comprehend. The mighty attributes of Deity, omnipresence and omnipotence, are ascribed to Him, also the creation of the earth from an infinite void, and its launching into space. The Hindoo theologians distinguished God in two situations—in the first He is Zeus, God *not* operating, not revealed—"Narayana, him who moveth upon the waters." In the second situation, Zeus becomes Brahma, God revealed and operating. According to this antique faith, matter is subject to the same laws of existence and decomposition as vegetables and animals; after a certain period of life comes the period of dissolution—everything decays, all returns to chaos; the harmony of worlds is at an end; earth, air, water, and light mix and become extinct. It is the Pralaya, the destruction of all that exists; but there is a germ, which purifies itself by repose till the day when Brahma comes to develop it, to give it life, the creative power; and to produce the worlds which commence little by little to form, to grow, and to operate, followed by the same repose and the same regeneration. These doctrines lie at the basis of the modern theory of Evolution, now so generally accepted by scientists. Also in complete harmony with modern science this ancient theogony declares the period of action and reconstruction of worlds to correspond to the period of 4,320,000 human years. The Pralaya, or epoch of dissolution, is of equal length. The sacred books declare that the germ of matter is fecundated by Brahma himself; Nature develops the elements.

As the night of Brahma approached its end, before proceeding to create this world, according to the Vedas, the Lord resolved to people heaven with beings born of Himself and sharing His attributes. So the angels sprang from His *thought*, and hastened to arrange themselves about His throne. But scarcely had this happened when the *inferior* angels, who had been assigned the most distant heavens, rebelled, with Vasonki at their head. Being chased from heaven into hell, they were named "Rakchasos," the cursed, says the Baga-veda Gite. When Zeus unrevealed became Brahma, operating and creating, three persons revealed themselves in him the Trimourti—Brahma, Vishnu, and Siva—or the creating, the preserving, the transforming principle. Brahma formed man and woman out of the purest of himself. He named them Adima and Heva, and gave them for a home the island of Ceylon. Here for a while they were quite content, but at length the man grew restless and persuaded the timid Heva to explore the country with him outside their garden domains. When they reached the limits of the isle and beheld a beautiful unknown land looming up beyond a narrow sea, and which they might reach by a rocky isthmus path, Heva remonstrated against their going further, indeed wept and prayed, and pleaded the commands of her Lord; but snatching her up in his arms, Adima boldly set out on the narrow path, and as his foot touched the new country, their peaceful island home receded from their vision like a mirage. Adima gave himself up to agonies of despair, but Heva knelt and prayed, and God had mercy on them. Such is the Vedic rendering of our Bible account of the fall of man.

The Vedas also recount the history of the patriarch Adjigarta, offering up his only son; a legend agreeing in almost every particular with the Bible narrative of Abraham, the "father of the faithful."

The Vedas declare the souls of men to be emanations from the soul of Brahma. In the hour of the decomposition of the body, they are reabsorbed into the Divine Essence, and this reabsorption is called Nirwana. The Hindoos do not admit the eternity of punishment—with them the guilty, after expiating their crimes in hell, undergo several transformations, and re-enter the spirit-

ual nature of Brahma after being thus purified of their transgressions. The Hindoo religion teaches its votaries to propitiate an offended deity with offerings, by prayers, fastings, ablutions, bodily mortifications and mutilations, rich gifts to the priests, and pilgrimages to the sacred river Ganges, or other holy places. The Fakirs are a species of fanatics, who mutilate themselves horribly, supposing thus to please God.

The theology of the Vedas is the fertile *ovum* whence issued Zoroastrianism, Buddhism, and Mohammedanism. Though pure and simple in its inception, it has become a tissue of horrible and corrupt superstitions in the hands of the Brahminical priesthood, who ruthlessly degraded the people in order more effectually to rule them. It was the Brahmins who created the famed castes of India—themselves, greedy and aspiring priests, being always high, or *first* caste; exclusion from all caste being the severest penalty known to their laws. This system of caste, an iron despotism, which makes progress impossible while it exists, is clung to by the Hindoos as if it were an open sesame to Paradise. They humble themselves to their British *masters*, and submit to any exactions, but if the English Lord, possessed by a brief fit of philanthropy, attempts to disregard the strict laws of caste, to succor a Pariah, an *outcast*, to abolish the car of "Juggernaut," great is the outcry, maddening the mutiny. They are ready then to revolt, burn, kill, ravage, and fight to the death.

According to the account of a recent French traveler, nothing can exceed the horror of the self-tortures inflicted by the Fakirs, when this car of Juggernaut, containing the hideous image of the god Siva, makes its annual progress. To prostrate themselves in order to be passed over by the sixteen wheels of this car is the commonest form of torture. Another festival of monstrous superstition is the "Nag Punchmi," or feast of serpents at Bombay. The Hindoos worship the serpent as they do Siva, the destroyer, and at the season of the year when the cobras are most dangerous, they celebrate this festival, decking their houses with flowers, praying for deliverance from the bites of serpents, and offering rice and sugar in the temples, where one of the grand ceremonies is *feeding* the cobras with buffaloes' milk, of which they are very fond, by means of "Sapwallahs," or snake-charmers.

But though India is now steeped in superstition, though British masters crush her pride and humble her dignity in the dust, though sunk in apathy, servile and passive, yet India has a *past* grander, more ancient than any other land the sun shines on. Happily for modern thought all vestiges of her glorious achievements are not yet obliterated. She has still her manuscript, still her ruins, still her Sanskrit tongue. And savants say: "It (the Sanskrit) is a language more copious than the Latin, more perfect than the Greek, and more exquisitely refined than either;" also, that the Sanskrit is the parent stock from which came the Greek language as well as the Latin; and that ancient India is the *parent* of civilization. Instead of Egypt being the fountain of learning, Menes, her founder, obtained his lore and laws from the Institutes of Manon in India; hence the Justinian Code, the Pandects, the Code Napoleon, the Common Law of England. Pythagoras and Plato, the Samian Sage, and the Prophet of Mecca, all drew from this fountain.

An extract from the ancient books of some of the precepts of Chrisna, the Hindoo Incarnation of Vishnu, may give the reader some notion of the wisdom which pervaded the philosophy of the prehistoric era in which the Vedas were written:

"Men who have no self-command are not capable of fulfilling their duties.

"Pleasure and riches should be renounced when not approved by conscience.

"The wrongs we inflict upon our neighbors follow us like our shadows.

"The knowledge of man is but vanity; all his best actions are illusory when he knows not to ascribe them to God.

"Love of his fellow-creatures should be the ruling principle of the just man in all his works, for such weigh most in the celestial balance.

"He who is humble in heart and spirit, is loved of God; he has need of nothing more.

"As the body is strengthened by muscles, the soul is fortified by virtue.

"As the earth supports those who trample it under-foot, and rend its bosom with the plow, so should we *return good for evil.*

"Science is useless to a man without judgment, as a mirror to a blind man.

"If you frequent the society of the good, your example is useless; fear not to dwell amidst the wicked for their conversion.

"When we die, our riches remain behind; our relatives and our friends only follow us to the tomb; but our virtues and our vices, our good actions, and our faults follow us in the other life."

Chivalry had its origin in India, and the magnificence of fabulous wealth created perfect elysiums of sensual enjoyment. When those who now rule her as conquerors were a mere horde of savages, the luxurious and learned Hindoos dwelt in stately places, cultivated high art, and sought to solve, with subtle analysis, the highest problems of metaphysics and mathematics. And the moderns have yet to excel the grandeur of her architecture, the splendors of her material life, and the profundity of her intellectual researches.

A lethargy rests upon the descendants of this ancient people, deep as the sleep of exhaustion. Let us hope they will one day resume the energies that have fecundated the world, and prove their right to the title of "Children of the Sun and Moon."

VIRGINIA D. COVINGTON.

DOES THE END SANCTIFY THE MEANS?

A CONTEMPORARY gives us an account of the outcome of a great lottery scheme, which was exploded a few years ago, and of which the reader has probably some recollection.

Kentucky wanted a public library, and to procure it without cost, the State Legislature authorized a lottery to be run for a certain number of years. The results were, of course, pernicious, not only in Kentucky, but throughout the country, where the tickets were sold — Kentucky, through her agents, carrying on a demoralizing traffic in defiance of the laws of nearly all the other States. The profits of the lottery were great, but only a small part of them found their way into the treasury of the library, much larger sums being divided among the managers, and these managers have never made a satisfactory financial statement. The trustees of the library, though men heretofore highly esteemed, appear to have been demoralized themselves by seeing these great sums gathered and dissipated in irregular ways. They wanted a share in the spoils, and seem to have secured it. At any rate, the resources of the library have been squandered, the number of books appears to be much smaller than was represented, the building is unsuitable for its purposes, there are no funds to pay insurance or other necessary expenses, but some of the trustees have had suspiciously large incomes. A suit has lately been brought on behalf of all the creditors of the library to compel the partners in the management of the lottery to pay back the profits they received in fraud, it is claimed, of the public as beneficiaries of the charity, of the corporation itself, and of the ticket holders. Some of the ticket holders are among the creditors who bring the suit, and their representative and counsel is Mr. Blanton Duncan.

The most interesting development of the suit so far is a long affidavit of Dr. C. C. Duncan, a gentleman more than ninety years of age, who has been a trustee of the library from the beginning, but is not at all satisfied with the way its affairs have been managed. He represents that the library building, which has cost $310,000, is dark, damp, and malarious, the books are ruined by dampness and mold, the librarian is afraid to stay in his rooms on account of their unhealthiness, and several of the persons employed have contracted serious illness there. The trustees bought an old law library from Colonel Durret, the President of the Board, which was of little real value, and many of the books so worthless that they were torn up and sent to the paper-mill. The trustees paid $7,400 for a manuscript catalogue which was never made, as it would expose the character of the books in the library and finally destroy all public confidence in it. One gentleman affirms that when the lottery drawings were all over and several hundred thousand dollars were on hand to be divided between the library and the lottery managers, the latter divided it all among themselves, leaving the library nothing. Thus we see men of good character, backed by the Legislature of the State, undertake a lottery scheme for a meritorious object, and the result is utter and general demoralization among all the parties connected with it, and dishonesty among others. The result aimed at has not been attained, while great moral damage has been done to the thousands who participated in it.

HOW TO TEACH.*

SECRETIVENESS.

THE design of this faculty is to produce reticence, concealment, judicious evasion, policy, and to exercise a restraining influence upon the other faculties. Some persons will bear pain, sorrow, disappointment, without showing it. Others will respond to any influence, good or bad, pleasant or unpleasant, as quickly as a bell will respond to a blow, or a musical instrument to a touch of its strings. These people speak out their thoughts, and in this respect place themselves at the mercy of others. One of the most palpable illustrations of saying too much, and being too frank, that we recall, occurred to the writer some years ago in Brooklyn, N. Y. He rang the door-bell of a house on which was posted a bill, "This House for Sale; inquire within." A little girl about eleven years of age opened the door. She had light-blue eyes and a blonde complexion, with a thin head above the ears, and was one of those nervous, helpful, wide-awake, open-hearted girls. We asked: "Is your father in?" "No, sir; *he will not be in till eight o'clock.*" Thus she answered twice as much as we asked. "Do you happen to know what your father asks for the house which the bill says is for sale?" "Yes, sir," she replied. "He asks four thousand dollars, *but will take thirty-five hundred.*" Large Secretiveness would have answered the questions very differently, and not have falsified the truth. We did not ask her what her father would ultimately take, but simply what he asked, and she should have given only a simple answer to that question.

Every one is conscious of thoughts and feelings the outward expression of which would be unwise and improper. Secretiveness serves to hold the other faculties in check until the judgment, the conscience, and prudence shall have time to decide upon the propriety of explaining the subject. When newspaper reporters visit some individuals in the way of "interviewing," it would seem that the persons were transparent; they can not say a little and stop, nor can they pick and cull their thoughts in such a way as to utter only that which is judicious, or that which the public has a right to know; but what they know about a subject is discharged like a bowl of jelly, which comes out all in a lump if it be emptied at all. Another man will be polite, will say something, but not commit himself, will not say that which is untrue, nor improperly conceal anything; but the interviewer goes away just as wise as he came, and, perhaps, has learned something that he did not know before, viz., that occasionally one meets a man who knows how to keep a secret.

Doubtless, Secretiveness is exercised in connection with the desire for praise, in concealing faults, in putting the bright side in front, and in ministering to the gratification of Acquisitiveness more than in connection with any of the other faculties. Secretiveness is sometimes used as a kind of cat's paw to do the sly work with. It serves as a veil of mystery, and sometimes tends to mislead. It holds up false lights as a decoy, but does so only when it acts without a proper union with Conscientiousness.

* From "How to Teach, according to Temperament and Mental Development; or, Phrenology in the School room and the Family." By Nelson Sizer. S. R. Wells & Co., New York, Publishers. Price, by mail, $1.50.

The teacher will be able readily to point out those students who are governed by policy, who are tricky and unreliable, and also those who are outspoken to a fault; and should try to guide those in whom the faculty is weak, and also those who have it too strongly marked, in such a manner as to bring about in each, so far as may be, a judicious medium. Threatening children with mysterious punishments, falsifying, deceiving in any way, are calculated to blind the Concientiousness of children, and also to excite their Secretiveness. They soon learn that if the parent, teacher, or servant falsifies, misleads, or in any way influences their will by false pretences, they soon learn that *they* may do the same thing with *their* associates. Children who are in a school where the teacher is the soul of frankness and judicious guardedness of expression, will show it in their own conduct and conversation in the play-ground. On the other hand, children who are under the dominion of parents, teachers, or servants who are too largely developed in Secretiveness, will always be playing sly tricks, or manifesting false pretences, or in some way showing perverted Secretiveness, acting without the proper control of judgment and Conscientiousness.

We remember a case in school, when something had been done that was wrong, the teacher demanded of the boys to know who had done it, when Charles Wright spoke up, and said: "I was one of the rogues!" But he declined to tell who were his associates. He was willing himself to confess when questioned, but was not willing to bring the others into trouble or disgrace. Finally, the teacher, in discussing the subject before the school and with the boy, and, doubtless, admiring his frankness in inculpating himself, and his reticence and honor in avoiding the inculpation of others, seemed, as we remember it, anxious to get out of the difficulty without punishing the boy, and said: "I hardly know what I ought to do in this case." And turning to the manly boy, said: "Charles, if you were a teacher, and you had a boy under the same conditions that I have you here, what would you do?" We remember how his blue eyes dilated, and how his form straightened up as he said: "I would say to the boy, 'I will let you go this time, and try you again.'" For a moment the teacher was unable to speak; but when he did, we recollect that his eyes were moist and his voice mellow, as he said: "I will try you again." Let the teacher remember that the influences he brings to bear upon the plastic minds of pupils in the school will stamp the truth or the error upon their minds and memories, will influence their character and conduct as long as they live, and prepare them to make like impressions upon those brought under their influence. Good actions never die, and evil actions live, and work for evil after the repentant evil-doer may have long been in his grave.

CAUTIOUSNESS.

The organ of this sentiment is located at that portion of the head which is situated upward and a little backward from the opening of the ear—the top corner, so to speak, of the head. Anatomically speaking, it is located in the center of the *Parietal Bones*. It is generally the widest part of the head, and frequently interferes with the fitting of the hat or bonnet. We find some cases of excessive development, which would show a head with nearly an inch more width on each side than our cut would indicate, and some are much

narrower at the location of the organ than the inner dotted line would show. This cut is introduced to guide observation, and show the methods of the development of the organ.

USES OF THE FACULTY.

Danger surrounds us, and to adapt us to that condition, this element of prudence, watchfulness, solicitude, and carefulness forms a part of our character. There is no emotion more painful than that of fear. Some have the faculty altogether too strong; others are almost destitute of it, and they become rash, careless, and indifferent to danger and difficulty. It is a great, conservative element in character, and ought to be well-developed. When it is excessive it paralyzes courage and energy, and of course magnifies trouble and difficulty.

In the training of this feeling many errors prevail. Children are threatened with horrid objects of dread. They may be frightened into obedience by stories of the dark, of witches, sprites, and evil agencies; and the organ sometimes becomes inflamed, and even diseased, and some have been driven to insanity through its excessive excitability. When fear becomes the law of action, conscience and judgment are set aside. Some are very bashful in the presence of strangers, and they become confused. They can not recite lessons, or make a good appearance among strangers; and how natural it is for others to be provoked at such timidity! Nearly every person will remember instances in which he understood his lesson, but the embarrassment and anxiety arising from Cautiousness and Approbativeness, utterly stultified his memory and judgment, and he broke down, greatly to his own chagrin, and to the surprise of his teachers and all his friends.

The proper way to train a child that is excessive in Cautiousness, is to attract its attention, away from itself and its fears, to something else. Awaken its intellect, its imagination, its love of a story, its sense of wit—anything but Cautiousness. Telling a child that a stranger "will not hurt it," is precisely the way to excite its fear. If we were teaching and had a timid pupil, we would not call upon him the first hour of the session for a display of what he might know. We would let him march with the other pupils—let him recite in concert, if he liked, or refrain from it. Pay no attention to him; let him get used to the place; and when we wished to make his acquaintance more especially, we would ask him if he had brothers and sisters, and how many, and if he had ever been to school before, and whether the teacher were a man or a woman; and when the faculties of Cautiousness and Approbativeness were measurably allayed, we would venture upon the real subject-matter of inquiry by degrees.

Persons who make calls in families where children are bright, but cautious and sensitive, often make a great mistake, in their desire to please the family, by paying particular attention to the children. This course embarrasses the children, and it makes them act in a way that embarrasses the mother, and it is an excitement and a worry to all parties; whereas the visitor should pay no attention to the child, giving the mother a wink perhaps that would be understood, and very soon the child's embarrassment and fear will have abated, when such attention as may be necessary will be acceptable to the child and the mother. The child and the visitor are no longer embarrassed. But the visitor who insists on having the child come to be

talked to, and the mother who pushes, pinches, and jerks the child, and gently frets at it because it acts *so rudely*, and gives it a scolding after the visitor has gone, spoils the visit for all parties, and makes the child run the next time he hears the door-bell ring, lest he be subjected to a like painful experience.

We have noticed when a timid child was brought to us, who was not willing to submit his head to examination, if we began to look at the feet, and talk to the child about its shoes, and then measured one foot for *skates*, it would put up the other to be also measured, and forget all about the embarrassing conditions. Then we would measure the head for a new cap or hat, and thus approach the child through its intellect, allaying the fear and excitement produced by Cautiousness.

APPROBATIVENESS.

The desire to gain the approval of others is one of the strongest traits of human nature. This faculty lies at the basis of the desire to please, and its influence upon character is immense. It gives the sense of shame and mortification when public sentiment is brought to bear against the individual, as it also produces gratification when praise, attention, and kindly appreciation are bestowed. It is a powerful stimulant to virtue and effort. If a man were living alone in the world, or if there were but a single family upon an island, cut off forever from all contact with others, their conduct, if not their characters, would undergo a marked change. To most persons in civilized communities, the love of praise is both a strong and a weak point. When it takes the form, or works in the direction of flattery or vanity, it becomes a weak point. When it serves to create ambition for eminence or noble attainment, it makes us strong, or is a powerful stimulant to the elements of strength. Doubtless, merchants, artists, professional men, writers, and orators will think more of the fame which success will give them than of the mere acquisitions. It does not require a great deal of money to supply a man's wants, but wealth gives him independence, influence, popularity, and power; and it is the consideration of these which stimulates to acquisition. If the orator, writer, poet, or artist can be remembered with respect and admiration in all circles, he feels that his labor has not been in vain. There are some men who have faith enough to sustain them through trial and privation, conscious that posterity will do them justice. They have a prelibation of the honor that shall be bestowed upon them when history shall embalm their names.

This organ is situated on each side of the crown, and it gives width and elevation to that region. It is indicated by length of fibre from the brain-centre, or *medulla oblongata*, or capital of the spinal column, to the outward situation of the organ. It lifts the head as if it were pulled upward and backward. Self-esteem is located on each side of the middle line of the head, between the two organs of Approbativeness.

The term respectability, or the idea which is crystallized within it, has a wonderful influence upon most people, and in the main it is a laudable and commendable state of mind; and it grows out of the normal activity of Approbativeness. The chief error in respect to this faculty arises from its paramount activity and consequent frequent perversion. While it is directed to proper objects, and is not stimulated to undue activity, but is kept in proper subordination to the higher

powers, its manifestations are not only pleasurable to the owner, but productive of virtue, good manners, and good order.

SLAVES OF PUBLIC SENTIMENT.

Although the undue activity of this faculty makes a great many people slaves to false fashions and false standards of respectability, it need not be crushed out, but allowed healthy development and harmonious activity that may be blended with the other faculties in giving proper shading to the character. In school and in the family this faculty is enflamed in a thousand ways; of course, without any intention of wrong-doing on the part of the parent, friend, or teacher. We often see it excessively developed in the head of a little girl, who is beautiful and interesting in many respects. Persons who are anxious to please her parents as well as herself speak thoughtlessly of her beauty in her presence. Whatever she says and does is repeated by fond parents and applauded, and, of course, she is necessarily made vain, if not selfish. If she does not receive praise constantly, she feels neglected and miserable; and chagrin or neglect excites Approbativeness unpleasantly, producing a kind of jealousy. In school, her good looks and gay attire will attract the attention of all, awakening the partiality of the teacher and the older pupils, and as a natural consequence, she is petted by all. If she is sharp and selfish in her temper, it is likely to be regarded as smartness, and it will be tolerated, if not excused We have rarely seen one of these petted children who was faithful and successful in study. Popular without effort, why should she labor to achieve success and respect for excellence in scholarship? Follow the same person into society—she meets with flattery, expects it, lives upon it. Such persons are sometimes even rude, fretful, and impolite. They are called "wayward beauties," "spirited," and every other name but the right one is applied. Follow her to church, and it is easy to see that her fine appearance and elegant attire are at least the means of attracting attention. She is fed on flattery, which the admiring attentions she receives are calculated to awaken. If she is defective in moral culture, because she has not been called upon to exercise these faculties in order to secure approval, it would not be strange, and if she were to become a selfish, peevish, hypocritical woman, utterly unworthy to be a wife and mother, it would not be a surprise to all those who see clearly and think soundly.

HOW AMBITION MINISTERS TO VIRTUE.

Study the faculty in another phase. Suppose a little girl, with a plain face, having large Approbativeness, and who is, of course, hungry to be approved, yet has not the external attractions to win admiration. At home she is not called beautiful, and, perhaps, her parents are not able to deck her in elegant attire; at school she is not flattered, and she has, therefore, nothing to withdraw her attention from her studies. Desiring, through active Approbativeness, to gratify her ambition, she sees only one way open to her to secure approval, and that is to be faithful in her studies, attain eminence in scholarship, and be patient, kindly, friendly, gentle in her manners toward her associates, that she may thereby win their respect, affection, and regard. She thus cultivates her moral and social affections, studies to make herself acceptable, though her face is not attractive, and

seeks to rank as high as possible in her studies, as well as in her decorum. Does it need a prophet to see that she will be the angel of some home, where solid virtues will be cultivated as a means of approval and applause, rather than the showing off of beauty and costly apparel to win temporary admiration?

We have seen it in several schools, we have witnessed it in many families, where Approbativeness was made the moving factor of all influence. Under this method of training and government, praise and censure are brought to bear upon the conduct of the young, and Approbativeness thereby becomes the only conscience which the child has, or it would seem that the parent and teacher thought so, since all appeals are directly made to this faculty. Instead of saying to a child, do this because it is *right*, and showing that it *is* right, the child is often asked: "What will people think?" "What will the world say?" If the people and the world were thoroughly good and wise, their approbation would be a good standard of morals; but even then, it would be better to appeal to the child's sense of justice, to its disposition to do right because it is right, and that would build up a standard of right-doing in him, independently of the world's knowledge or opinion in regard to his conduct.

If this organ be very strong, it should be the aim of the teacher and parent to avoid addressing the child through this faculty, but appeals should be made to the intellect, to Conscientiousness, to affection, to Benevolence, to the sense of the fitness and propriety of a particular course. Let the child be trained to feel that no praise has value except that which is sanctioned by the principles of reason, righteousness, truth, and justice.

HOW VANITY IS FOSTERED.

The trouble in the training of this faculty, as well as in that of many others, is that the weak points and also the strong points of the child come in the same place where the parents' strong and weak points do. A mother who is keenly alive to what people will say, is very apt to ply her child.en with that influence. If Approbativeness be large, she will be likely to use that faculty, because it qualifies her to bring its influence strongly to bear upon her child; and if it be the strongest trait with her, she thinks it is so with her child. Let a teacher who has an excess of Approbativeness go into a school, and all the pupils who are organized in the same way will soon feel the magic power of her influence. A course of conduct that can be ridiculed or made the subject of shame will keep these pupils on the *qui vive*, and, perhaps, for a month the stern mandates will not be brought to bear upon the dull or active consciences of the pupils. An act is called "shameful," "disgraceful," "ridiculous," "outrageous," "inelegant," "impolite," "very improper," but it is not once called "WRONG." If it be shameful or ridiculous, that is reason enough for such a teacher and such pupils why anything should be avoided. It may be all else that the teacher says it is, but if it be intrinsically *wrong*, *that* should not be left out; indeed, it should be stated as the first objection, and all the other conditions may then be instituted as collateral forces.

HOW TO TRAIN EXTREMES.

If a class of pupils could be selected out of a hundred in whom Approbativeness were weak, and who needed, therefore, a good deal of culture in that respect, we would like to place a teacher in charge of such a class who had a little too much Approbativeness, so that she

would keep ringing the changes on that faculty, putting it, as it were, under her hothouse treatment, and bringing the focal rays of its might upon the unproductive soil to induce a development of the organ in the pupils who had too little of it. On the other hand, if we could take all the pupils in the school who had excessively developed Approbativeness, we would put them in charge of a teacher who had only a medium share of it, but a strong development of those qualities with which the pupils were endowed only in an average degree. In six months' time the feverish excitement of Approbativeness in those pupils would be lowered by twenty-five percent., as it ought to be, and they would learn, for the first time, perhaps, to take into consideration other points in regard to conduct and character besides Approbativeness; would learn that other influences could be brought to bear upon the regulation of the conduct of their daily life, and that conduct had other and even richer remunerations

Of course it is not expected that pupils can be classified with respect to each of their faculties, but only according to groups of faculties and temperaments. But if a teacher be wise and well-informed in regard to the correct mental philosophy, he will instantly see who is well-endowed with the faculty of Approbativeness, and who is deficient. This can be determined as readily as any other fact in respect to the person. We can see who have large and who have small eyes; who have strong features, and whose are delicate; who are dark and who are light; who are prominent in the brow, and who have a prominent top-head; and the development of Approbativeness is quite as easily recognized, and even the natural language or manner of the person, at the first interview, will readily tell the phrenologist whether Approbativeness is a leading trait, or whether it is much excited at the moment.

Teachers and mothers should thus take the hint, and the treatment of those in whom the organ is large or small should be so conducted as shall be best for the individual, and best for the purpose to be attained. This being one of the more influential of the faculties, it may properly form the nucleus for a leading classification of pupils.

If one wishes to exert a quick influence, if he has only a moment to act, he must work through the strongest faculties. If his object is to cultivate, mold, and train the character, then he should guard against exciting the abnormally strong faculties, and treat the subject so as to call out the dormant and less influential faculties. We know that a man who loves money supremely will be most easily influenced by an address to that feeling. It becomes the center and source of influence in himself, his object of desire, the inspiration of every effort; while Approbativeness inspires one to work hard, and watch and be wakeful and weary in the pursuit of objects the attainment of which will give rank, reputation, and honor.

This faculty is certainly right in its normal action. It ministers to virtue among those who rise to a medium position in morals more than it ministers to vice. Among the baser sort, who simply glory in their strength, their lust, their courage, or their cruelty, it tends to foster vice. The faculty sometimes, of course, leads to crime and sin, but it ought to work with the higher sentiments, so that ambition and pride shall minister to virtue and lead in that direction.

The standard of respectability will be catered to by this faculty, whether it be high or low, good or bad. In commercial circles, wealth is a great element in respectability. Among scholars, attainment. Who thinks to ask, or who cares how much Tennyson or Longfellow may be worth in property? We may hope they have a sufficiency. Their rank and renown have in no sense the flavor of finance.

WHY NOT SPEAK PROPERLY?

THE careless, slip-shod manner in which people who deem themselves educated use common English words in their every-day speech is scarcely short of amazing. If appearances deceive in any particular, it is certainly in this; for if we were to infer the degree of culture possessed by the men and women we meet daily from the character of their verbal expressions, we should set it, in most cases, at a point much below their claims. Every word in the English language has its peculiar significance and application, just as would be rationally thought, and the cross uses and false applications so common in ordinary parlance are totally unwarranted.

Society has fallen into a vicious habit in the use of terms, and it is time that a strong effort was made to eradicate it if we would preserve the English tongue in its purity and simplicity. The little volume, "The Right Word in the Right Place," and Mr. R. G. White's larger book on "Words and their Uses," are excellent monitors for popular reading, and show clearly the errors we are constantly committing without a thought of their glaring absurdities. We quote from the latter a few examples of the more common improprieties of language:

"Aggravate. This word should never be employed in reference to persons, as it means merely to add weight to—to make evil more oppressive; injury is aggravated by insult. It is sometimes improperly used in the sense of irritate, as 'I was much aggravated by his conduct.'

"Balance, in the sense of rest, remainder, residue, remnant, is an abomination. Balance is the difference between two sides of an account—the amount which is necessary to make one equal to the other. . . . . Yet we continually hear of the balance of this or that thing; even the balance of a congregation—of an army.

"Bountiful is applicable only to persons. A giver may be bountiful, but his gift can not—it should be called plentiful, or large. 'A bountiful slice' is absurd.

"Fetch expresses a double motion; first from and then toward the speaker. It is exactly equivalent to 'go and bring,' and ought not to be used in the sense of bring alone.

"Calculate, besides its sectional misuse for think, or suppose, or suspect, is sometimes in the participle form—calculated—put for likely, or apt: 'That nomination is calculated to injure the party.' It is calculated (designed) to do no such thing, though it may be likely to.

"Citizen should not be used except when the possession of political rights is meant to be implied. Newspaper reporters have a bad habit of bringing it out on all occasions when 'person,' 'man,' or 'bystander' would express their meaning much better.

"Couple applies to two things which are bound together or united in some way. 'A couple of apples' is incorrect; two apples is meant.

"Dirt means filth, and is not synonymous with earth or soil. Yet people sometimes speak of a dirt road, or of packing dirt around the roots of trees they are setting. They mean earth.

"Execute. When a murderer is hanged, his sentence is executed, but the man is not. A man can not be executed—that is, followed out or performed.

"Expect looks always to the future. You can not expect that anything has happened or is happening, but only that it will happen.

"Get means to obtain, not to possess. 'He has got all the numbers of the *Christian Instructor*.' 'Have you got good molasses?' 'They have got bad manners.' Why will people persist in introducing the word in such sentences as these, where it is so evidently superfluous?

"Help meet. An abusive use of these two words as if they, together, were the name of one thing—a wife—is too common. The sentence in Genesis is: 'I will make him a help meet for him;' that is, a help fit for him. There is no such word as helpmeet.

"Lie—Lay. Persons not grossly ignorant sometimes say they will lay (meaning lie) down, that they have laid (lain) an hour, or that the hammer is laying (lying)

by the tacks. Lie means to recline; its past tense lay—'I lay there all night;' its participles, lying and lain. Lay (used of present time) means to put something down—one lays a carpet; its past is laid—'I was interrupted while laying it, and it was not laid until night.'

"Love rules the heart, not the stomach. You love your wife, or ought to; but favorite articles of food you like.

"Observe should not be used for say, as in the oft-heard sentence: 'What did you observe?'

'Sit, often mispronounced set, is occasionally written so; but it is to be hoped rarely."

IS MAN AN ANIMAL?

IN a late number of the PHRENOLOGICAL JOURNAL one of your correspondents says: "Man is not a 'higher animal.' He is not an animal at all." What is animal? The word is derived from the Latin word *animalis*, of, or belonging to, the soul, from *anima*, a soul. If the derivation is correct, an animal must be a being possessed of an anima, or soul. What has a soul is an animal, and what has not a soul is not an animal. To deny this, is to deny the plain import of language.

The Hebrew *nephish*, the Greek *psuché*, and the Latin *anima* are synonymous with the English word soul, and the Anglo-Saxon *samle*; they mean the same thing. The one is properly translated by the other. In the original of the Bible, the word *nephish*, soul, is very frequently applied to mere animals, and also to man. It is as applicable to the one as to the other. The vegetable has not a nephish, or soul, and therefore is not an animal. It is merely corporeal. According to the original language of God's Word, everything, from the lowest animal up to man, that has the nephish, or soul, is an animal. See various passages in the original from Genesis i. 20, 21, 24, 30; ii. 19; ix. 10, 15, to Revelations viii. 9. The *nephish*, *psuché*, or soul, is applied to mere animals, and ought not He who made them to know whether His own language is correct or not, or whether it needs the corrections and emendations of man?

As is the rank of the body, so is that of the soul [*nephish*], but there is no other soul on earth that will begin to compare with that of man. In soul and body he stands at the head of creation on earth—earth's lord. Man is an animal, but was made worthy of Him whose image and likeness he bears. Of no soul, except that of man, is life after death predicated. Mere dead animals are never called *psuchai*, souls.

The vegetable has only the body—is only corporeal. The mere animal has only the body and soul. It is both corporeal and animal. Man alone on earth is a trinity; and he is as really a trinity as his Maker is a trinity. He was made in the image and likeness of God. Genesis i. 26. What God is, man in his original purity was, but God is infinite, and man is only finite. The Bible gives us reason to believe that what man is, all the higher intelligences of all worlds are. All are trinities, or at least were created trinities. Many of the fallen have ceased to be trinities. They have become mere spirits, because they are fallen. Mere spirits are only to be found among the fallen. Deny this, and there are many passages of Scripture which can not be explained.

That man is as really a trinity as God is a trinity, is evident from many passages of God's Word. Man has a body, a soul, and a spirit. 1 Thessalonians v. 23. The body he has in common with all vegetables and all animals, and therefore he is allied to both, and he is a corporeal being—a body-being. The soul [*nephish*] he has in common with every animal in the universe, and he is allied to them; he is an animal. But the *ruach*, *pneuma*, or spirit, man has in common with God, and all the highest intelligences of the universe. In the proper and highest sense of the word, only intelligences have the spirit. In consequence of his having the pneuma, or spirit, man is incomparably above every mere animal on earth.

Death is not predicated of the spirit, but it is of the soul. I believe this is true of the

original, and of every translation of the Bible. I have fourteen different translations, in quite a number of different languages, and yet I have never seen the expression "immortal soul" in any Bible; but the soul [*nephish*] is very frequently spoken of as dying or being dead. Recently, in looking over the index of a celebrated work, I found that while the author says the soul exists in the separate state, he does not give a single proof-text that refers to the *psuché*, but such as refer to the *pneuma*, or spirit. Had he said that man may exist in the separate state, or that the souls of the righteous do exist in that state, or that the spirits of all do exist in that state, it would have been easy for him to have adduced proof-texts, but to prove that the soul is immortal is an impossibility. He who considers the soul and the spirit to be one and the same, grievously errs.

The words *nephish* and *psuché*, like the English word soul, is often used for the whole man, the person. We say of a city that it contains so many souls; that is, so many persons. 1 Peter iii. 20. "Wherein few," that is, eight *psuchai*, "souls were saved by water." Christ says, Matthew ii. 25, 26, "For whosoever will save his *psuché* [soul], shall lose it; and whosoever will lose his *psuché* [soul] for my sake, shall find it. For what is a man profited, if he shall gain the whole world and lose [*zemiothe*] his own *psuché* [soul]?" or, "What shall a man give in exchange for his *psuché* [soul]." See also the original of Mark viii. 35, 36, and Luke ix. 24, 25. That the word *psuché* is here used for the whole person, is evident, for Luke, in one instance, used *seauton*, himself, for *psuché*. Very many other passages in the Old and New Testaments might be given. JAMES BOGGS.

AN INTIMATION.—Much interest was awakened at the Centennial Exposition by the appearance there of a new kind of ironware for domestic uses. The array of utensils of almost every conceivable shape and adaptation was very large, and the housekeeper was inclined to linger over them and express an enthusiastic appreciation of the ingenuity and enterprise which had brought out so convenient a material. This ware was called "Granite" on account of its resemblance to gray-stone. It found a ready market, and, as is usually the case, awakened competition. A similar pattern of glazed iron was introduced by another company, and styled "Marbleized Ironware."

After a while considerable stir was made by the announcement that in this beautiful coating of the dish, kettle and pan, might lurk an insidious poison. A letter published in *The New York Herald*, by a Mr. G. T. Angell, averred:

"Our State chemist, Dr. Hayes, of Boston, has analyzed several specimens, and found the enamel to contain lead and arsenic in very dangerous proportions. Sauces, sour milk, tea, and water even, take the poison."

The editor of the Boston *Journal of Chemistry* commented on this development thus:

"It would certainly be a short-sighted policy for manufacturers to use such materials if they were necessary (which they are not), for the fact would soon be known and the sale of the ware arrested.

"The glaze used is essentially a glass, or a silicate of soda, with some modifications adapting it to the purposes of a glaze. There is no need of the use of lead and arsenic, and if only traces of these agents are found, we do not think that any special alarm need be felt among housekeepers. Care should be used to observe if the glaze remains intact by use. If it cracks, or small bits separate, so as to become mixed with the food, it might become dangerous from its physical effects."

Of course the manufacturers gave attention to the matter, and the "Granite" people issued a circular in which were set forth the opinions of eminent chemists regarding the character of their ware, and asserting its perfect freedom from substances which could poison.

It is only by training all together—the physical, intellectual, and spiritual elements—that the complete man can be formed.

"MEAT" IN THE SCRIPTURE SENSE.

UNDER the caption of "Condensed Meat," Dr. E. O. Haven critically discusses the significance of the terms in the New Testament, which have been rendered by the English word *meat*, and it will not fail of interest to hygienists, to read the views of a critic who makes no profession, so far as we know, of vegetarian practices. He says:

"The word meat occurs in the New Testament nearly fifty times, being the translation of ten different Greek words, no one of which means, or suggests the meaning of 'meat' in its modern sense; and each of the ten Greek words could be better translated into English without the use of the word meat, and each ought to have its own proper translation.

"The first word so translated is *broma*, literally food, or something to be eaten. In Luke iii. 31; ix. 13; John iv. 34; Romans xiv. 15, 20; 1 Cor. viii. 8, 13; x. 3; it would be much better to translate it 'food' than 'meat.' In 1 Cor. iii. 2, where a contrast between milk and *broma* is drawn, it might be, 'I have fed you with milk, and not with any thing to be eaten.' In Mark vii. 9; 1 Cor. vi. 13; 1 Tim. iv. 3; Heb. ix. 10; xiii. 9; where the plural is used, 'meats' might be allowable, but 'different kinds of food' would be preferable. The second word translated meat is *brosimos*, the adjective from *broma*, Luke xxiv. 41. 'Have ye here any meat?' It should be, 'Have ye here any thing eatable?'

"The third word, *brosis*, is translated variously—in seven places meat—but should always be translated food. Consult John iv. 32; vi. 27–55; Rom. xiv. 17; 1 Cor. viii. 8; Col. ii. 16; Heb. xii. 16. It need never be understood as flesh, but always food.

"The fourth kind of meat is found in the word *phagein*, in Matt. xxv. 35: 'I was a hungered, and ye gave me meat.' It should be, 'and ye fed me,' literally, 'ye gave me to eat.'

"The fifth word is just as obvious a mistranslation, *prosphagion*. John xxi. 5: 'Children, have ye any meat?' The real question was, 'Children, have you any thing for me to eat?' Literally, any thing usually eaten with other food—any little thing to eat.

"The sixth word that introduces the word meat is nothing more nor less than table, *trapeza*. Acts xvi. 34: 'He set meat before them,' is a mistranslation. It is literally, 'He set a table,' that is, he gave them a dinner, or a meal of victuals.

"The seventh word introduced into this hash, made up of ten elements, but all called 'meat,' is *trophe*, which every Greek scholar recognizes as nourishment, or whatever nourishes. There are fourteen verses in the New Testament in which this word occurs as meat, but in all cases the word nourishment is better.

"The eighth word so restricted is *eidolothuton*, Acts xv. 29. Literally it is 'a thing offered to an idol.' It may be flesh, or vegetable, or liquid, or any thing else. 'That ye abstain from meats offered to idols.' It should be 'from whatever is offered to idols.'

"The ninth member of this illustrious ten is *sitometrion*. Luke xii. 42: 'To give them their portion of meat in due season.' *Sitometrion* was a technical term, meaning rations, the food given daily to a soldier or employee of the Government. 'To give them their rations,' or regular food.

"Finally we reach the tenth word translated meat, *sunanakeimai*, which means simply 'sit with,' and is usually so translated, but in four verses our translators introduced the words 'at meat.' In Matt. xiv. 9; Luke vii. 49; and Luke xiv. 10, 15, the 'at meat' should be stricken out. It existed only in imagination. Thus we can wholly dispense with the word 'meat'—perhaps retaining 'meats' in the New Testament. Yet in the few passages where 'flesh' occurs as an article of food, meat would be as good a translation. A similar want of discrimination is shown in the translation of the words rendered 'food.'

"There can be no doubt that a revision of the English Bible is required, and it is to be hoped that the translation now in preparation will be faithful to the original."

THE ACTION OF MEDICINES.

A "QUERIST," writing to the Chicago *Inter-Ocean*, propounds the following conundrum:

ALVIN, ILL., June 14, 1877.

1. We are taught by all the drug medical schools that drugs *act* on the system. What proof have we that such is the case? 2. If an emetic *acts* on the stomach, what is the *modus operandi?* 3. Are not the medical profession in error on this point, and are not the effects of medicines caused by the living system acting upon them to expel them from the vital domain because they are poisons and non-usable? QUERIST.

The *Inter-Ocean* replies:

Answer: 1. The effects they produce. 2. An emetic is a medicine that causes the stomach to contract and discharge its contents through the œsophagus. They are of two kinds, viz., those which act on the muscular coats of the stomach directly, as alum, cupric sulphate, etc., which act promptly, and those which enter into the circulation and cause emetic action by their effect on the nervous center, such as ipecacuanha, tartar emetic, lobelia, and many others. 3. This can hardly be considered a fair question, because it involves the discussion of numerous others dependent upon it. It is true that many medicines are virulent poisons, while others are not. Any substance that has the property of curing or mitigating diseases may be called a medicine, and most of such remedial agents enter largely into foods of various kinds, which stimulate the system and produce different effects. We are aware, however, that there is a school of physicians that have held that all medicines are poisons.

The above answer shows how difficult it is to understand or interpret facts in opposition to a preconceived opinion. The *Inter-Ocean* seems to be quite unaware that its argument disproves its theory. It says the proof that drugs act on the system, is "the effects they produce." Now these effects prove exactly the contrary. The *Inter-Ocean* does not mention a single effect that is not an action of the living system. An emetic "causes the stomach to contract and discharge its contents." Very true; and this contraction (effect) is the action of the living stomach. The stomach contracts on and expels the drug, therefore it acts on it. If the drug contracted on and expelled the stomach, the effect would prove the action of the drug. But this never occurs.

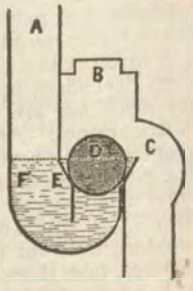
But the *Inter-Ocean* seems to be a little dubious of its own argument, and thinks the question is hardly a fair one, because its discussion involves other questions. I can not see how the involution of ten thousand other questions can affect the fairness of this one. Drugs do act on the living system, or they do not. It is plain yes or no. And the question is susceptible of demonstration on its own merits. Indeed, the demonstration is afforded in "the effects they produce."

But to make the matter still plainer, let us take the simplest possible illustration. A horse and cart are seen moving along the street. Does the cart push the horse, or does the horse draw the cart? Reasoning from "the effects produced," the *Inter-Ocean* might say that the cart causes the muscles of the horses legs to contract, and so the horse moves along and draws the cart, all right; but wherein is the action? This is wholly on the part of the living thing, the horse.

If the *Inter-Ocean* will ever thoroughly investigate this subject, it will learn that, in

the relation between dead and living matter, the living is always active and the dead always passive. This is a law of nature and can have no exception nor qualification.

The *Inter-Ocean* is involved in the error of the whole medical profession in mistaking *effect* for *action*. They are very different. Dust in the nose may be the cause of sneezing. But sneezing is the action of the living system; or, in other words, the *effect* of dust in the nose is sneezing; but this effect does not prove that the dust acts on the nose. It proves just the contrary.



Again, every effect of every one of the two thousand drugs of the materia medica is a *symptom of disease;* and all symptoms of disease are actions of the living system, or the effects of such action. Let any one name any effect of any medicinal drug whatever, and then turn to any standard work on Pathology, and he will find such effect mentioned as a symptom of disease; and if he will then turn to any work on Toxicology or Medical Jurisprudence, he will find the same symptom mentioned as a sign or symptom of poisoning. These facts prove that all medicines are poisons, and that whenever they occasion appreciable effects, the effects are disease. But disease itself is vital action. It is the action of the living system in its efforts to rid itself of poisons and impurities.

But in conclusion, what does this all amount to? Is it anything but a verbal theory, whether drugs act, whether the living system acts, or whether both act? It amounts to everything so far as a correct medical science and a true healing art are concerned. Medicines are administered because they are supposed to act on some part or organ in virtue of some special inherent affinity for that part or organ. The assumption is scientifically absurd; but without it drug doctors have no theory, no basis, no reason, no excuse for poisoning a person because he is sick. As soon as the people can be made to understand the primary and self-evident truth, that the so-called *modus operandi* of medicines is simply the effort of the vital domain to rid itself of their presence, they will never more consent to swallow poisons, or anything else but usable things—food and drink.

R. T. TRALL, M.D.

A NEW SEWER TRAP.

WHILE it is a question, whether or not the substitution of the modern system of sewerage for the old system of open drains and cess-pools, has been of any benefit to the health of the community, there can be no question as to the deleterious effects of the present system, and of its connection with the more fatal modern diseases, diphtheria, scarlet fever, etc. It could scarcely be otherwise, with houses more or less constantly permeated by the foul emanations of the sewers, products of decomposition laden with the sphores of disease; returned through the waste pipes, to be deposited in the lungs, and to impregnate the blood with the seeds of death. The common system of sewerage is specially defective in the trapping of the waste pipes, for not only are they not sufficiently trapped, but the traps in use are inadequate, in that a trap which offers only water as a preventive to the return of the gas, affords only a partial protection; as water is a ready solvent of all gases, which it will take up under pressure, to part with where the pressure is less. But even were water a sufficient protection, it is

A SEWER TRAP.

constantly being siphoned out. To meet this objection a number of valve traps have been invented, but none which seem to offer greater advantages than the one figured above, which is offered to public considera-

tion as at once effective, durable, and simple in construction. It is a modification and improvement of the old style ∽ trap, combining all the efficacy of the water trap, with the addition of a ball valve, which at the same time is independently efficacious, and equally so whether there be any water in the trap or not.

In the design the ∽ trap is fitted in the second bend with an oblique enlargement E, an upward extension B, and an oval opening C, in and above the oblique enlargement. The oblique enlargement forms the seat for an air-tight ball valve, and the water lies in the trap to the level F, there being just enough in the trap to secure the dropping of the ball upon its seat. Any excess of water falling into the trap causes the ball to rise above the outlet C, which being oval, the ball can not clog, and being of the same capacity as A, can offer no obstacle to a free outflow. As soon as the water runs off, the ball drops back into its place by its own gravity and presents an impervious barrier to the passage of any gas; all pressure from the sewer side, only fixing it more firmly. B. F. UNDERWOOD, M.D.

Patented April 5th, 1877.

OLD-TIME PHYSIC.

THE evidences of their *peculiar* skill, which eminent physicians of three or four centuries ago have left on record in the shape of prescriptions and admonitions, appear to the medicists of the present day crude and ridiculous enough, and yet, can it be said that modern pharmacy has reduced the mortality by disease below the rate of mediæval times? One or two leading doctors have distinctly affirmed that with the increase of physicians, and of the Materia Medica, diseases have increased.

A medicist of the Elizabethan era, whose reputation was considerable for ability to treat successfully the ills to which flesh was then heir, has left us some clews to his method of "discussing" a case in the way of prescription. This is one which, for the multitude of its ingredients, certainly deserves the title "panacea."

"ELECTUARIUM DE GEMMIS."

"Take two drachms of white perles; two little pieces of saphyre; jacinth, corneline, emerauldes, granettes, of each an ounce; setwal, the sweate roote doronike, the rind of pomecitron, mace, basel seede, of each two drachms; of kedde corall, amber, shaving of ivory, of each two drachms; rootes both of white and red behen, ginger, long peper, spicknard, folium indicum, saffron, cardamon, of each one drachm; of troch diaroden, lignum aloes, of each half a small handful; cinnamon, galinga, zurubeth, which is a kind of setwal, of each one drachm and a half; thin pieces of gold and sylver, of each half a scruple; of musk, half a drachm. Make your electuary with honey emblici, which is the fourth kind of mirobalans with roses, strained in equall partes, as much as will suffice. This healeth cold diseases of ye braine, harte, stomack. It is a medicine proved against the tremblynge of the harte, faynting and souning, the weakness of the stomacke, pensiveness, solitarines. Kings and noblemen have used this for their comfort. It causeth them to be bold spirited, the body to smell wel, and ingendreth to the face good coloure."

A GOOD TIME.—We are told that a birthday party was given a little boy in Brooklyn recently, and one of the guests described it to a physician the next day in the following terms:

"First we all had some lemonade and sponge cake; then we had birthday cake and ice cream; then we had lots of mixed candies and some nice chocolate; and then we had some more lemonade and birthday cake and caramels; and then Hattie Thomas and I had an awful stomach ache, and Johnnie's mother and Miss Mary mixed a big glass full of peppermint water, and after they made Hattie and me drink all we could of it, they gave the rest all round to the others, and Johnnie's mother said she guessed we had better go home."

THE PLUM AND THE APRICOT.

Recipes: Canning Plums—Ambrosia—Dressing—Pie—Prunes.

UNLIKE the coy, barbaric king of our last number, who was so unwillingly introduced to civilization, our present subject was the friendly companion of the first nation that walked out of barbarism into civilization. The ancient Egyptians raised plums. Plum trees abounded in Thebes and Memphis. The plums of Damascus also were in great repute, and all of these places sent this delicious fruit into Europe as soon as there were people there sufficiently civilized to appreciate it.

CLASSIC MENTION.

Some of this fruit was dried, and some was preserved in honey or in "sweet wine"—notice *sweet wine*, that is the quotation from old Athenæus. It was probably stewed down in grape juice, making a delicious preserve. In the time of the Cæsars the Romans raised their own plums, of the most delicious qualities, "in purple and gold," says Virgil; while Pliny complained of their abundance as a useless luxury. Ah, could those ancient wiseacres have known true wisdom, they would have been content if the people had indulged in nothing more hurtful than plums. Pliny's "Damascene plum" is our Damson, which has kept its characteristics probably without much change. If they had other choice varieties in those days, we know nothing of them now. The next variety seems to have come out of the unknown, or rather to have sprung in all its perfection from the hands of Queen Claude, like Minerva from the head of Jupiter. Doubtless she did not make it; we are merely told that she "introduced it," and in France it still bears her name. It is the *Reine Claude*. The Germans, with their usual lack of happy adaptability in the use of foreign words, have called it *Renklode*, and prefixed the *Grunen*, as if anticipating the (late) introduction of the *Reine Claude Violette*. This *Reine Claude* is the

GREEN GAGE

of the English, and the following account is given of this new christening: A family by the name of Gage, in England, obtained some fruit trees from the Monastery of Chartreuse, at Paris, and among them was a plum tree, upon which was no label. Like many a literary venture, when the name of author and publisher is lost, it was claimed by the finder, and the gardener of said family christened it with the family name and called it a Green Gage. And so the name (if not the family) has been perpetuated, and we have now several varieties of *Gages*, which has become a specific name, and probably very few of those who use it suspect that a Gage was not always simply a *plum*. This comes probably from a peculiarity of dropping the "plum." And so of Damsons, standard English cook-books seldom putting either of them under the heading of "Plums." There is many a queer history in a word, and if "Reine Claude" holds sway only in France, it is no more than a just retribution for not giving the name and the lineage of the waif that she introduced.

WILD PLUMS

are abundant in both hemispheres, but we are not aware that any of our delicious, cultivated varieties came from them. In England there is the Sloe, or thorny plum, found in Wales and sometimes in Highland valleys. It is acceptable for its abundant early white flowers, but its fruit, attaining the size of a large black currant, is ripened only by frost, and not very palatable at that. Its suckers, which are very abundant, are much in demand for walking-sticks. One variety, which has a profusion of large double white flowers, is cultivated in China and Japan. The Bullace is another wild kind, common on the Continent, and the fruit of this is in some demand for cooking. Uncooked, they are so sour that in Provence they are called *sibarelles*, because it is impossible to whistle just after having eaten them. In this country we have at least three distinct kinds, the fruit of which is in some demand. The Chickasaw plum is found in the South and West, a variety of which is the Dwarf Texas plum. The wild red or yellow plum (for it varies in color) is found all the way from Canada to the Gulf. It has a thicker skin than the previous species, and is quite in demand in new countries, where fruit is scarce. I have never seen it cooked "hygienically," but I have very pleasant recollections of its toothsomeness when fresh (rejecting the skin) and of the "preserves" it made for winter use. The "beach plum" grows on or near the sandy sea-coast from Massachusetts to Virginia. It has of late frequently found its way to city markets, where it attracts a fair share of attention as the first plum of the season. These are a purplish red, but they all fall far short of the richness in taste or appearance which characterizes the cultivated plums. These, after having come up out of Egypt and wandered through Europe, have found at last their congenial home in America. This is the

PARADISE FOR PLUMS.

In no other country are they known to sport into so many varieties, to grow with such luxuriance, and to ripen into such deliciousness. The soil and the climate seem perfectly adapted to their wants. It must be admitted, however, that this is only in favored localities. The Hudson River is one of these, especially in the vicinities of the cities of Hudson and Albany. The soil, a rich clayey loam, is not only just what is needed for the growth of the tree, but the clay is not easily penetrated by the curculio, that fearful enemy of the plum. Other sections of the country also produce the plum, but the sandy soils of Long Island, New Jersey, Delaware, and Maryland are not well adapted to its growth; or if it grows, its fruit falls a prey to its insect enemy. All these considerations greatly limit its growth, and especially its production for the market—the practical fruit-growers preferring for their other fruits the sandy soil which is not favorable to the plum. So it often happens that the markets of the great eastern cities are but poorly supplied with a fruit which in the hands of amateurs is one of the finest in the country, compared with the produce of other lands. Speaking of

THE CURCULIO

reminds us that it is worth the while to point out how science is able by diligent

study to overcome the difficulties of nature. This little pest, which ruined so many promising orchards, seemed like one of the plagues of Egypt—so mysterious, far-reaching, and defiant. But the skill of brain triumphed at last. This insect is a little dark brown weevil, less than a fourth of an inch in length, and so shy as often to elude notice. It does not eat the fruit; it simply punctures it soon after it has set, making a little crescent-shaped scar, which is not noticed until July, when the fruit begins to drop. It is too late to save it now, for the mischief is done. Careful watching immediately after the blossoms fell, would have detected the thief. Perhaps the best way to find him is to spread a sheet beneath the tree and then strike its trunk sharply with a wooden mallet, and with sufficient force to jar the tree. Now if something that looks like a ripe hemp-seed falls, examine it, and you may find it the curculio rolled up and playing possum. You will know him by two little humps on his back. Dispatch him quickly, and strike the tree again until you have shaken them all off.

His business there is to puncture the fruit with his mandibles and deposit an egg, one in each fruit. The egg hatches and the worm eats its way to the stone; when the fruit drops, the worm crawls out, enters the ground and is supposed to remain there until spring, when it comes out a weevil, ready to go through the same round as its parent. A clay soil is not easily penetrated by the worm. The dead plums may be gathered and scalded or fed to the hogs Hogs and fowls may be turned into the plum orchard. The ground at this season may be covered with cement or with salt, which not only kills the grub, but becomes a good fertilizer; the ground may be paved, or the tree may be planted in or by the side of some frequented path. All these are popular and effective remedies or preventives to the ravages of the curculio.

CULTURE.

Besides these hints, it may be well to know that plums sometimes come true from seed; that by planting a good variety you are more likely to produce a good tree than with most other kinds of fruit. This makes it very interesting for experiments. The stones should not be permitted to mold nor to become very dry. Mix them with sand, but do not keep them saturated with water. Let them thaw and freeze through the winter, and if you wish to be certain of growth, make sure that the stone is cracked open in the spring. If the frost has not done it, crack it by striking the edge gently with wood on wood. Then plant carefully one or two inches deep and cultivate thoroughly, having clay in the soil if you can get it. The nurseryman usually plants seeds of the free-growing sorts, and buds with the kinds he wants in a little less than three years from the time the seed was planted, or about the middle of July. The plum is a hardy tree and requires but little pruning, which should be given it before the middle of the summer, so that the gum shall not exude and waste the life of the tree.

VARIETIES.

We have in America originated nearly all our choice kinds, excepting the Green Gage and the Damson, and for these we have paid the mother country good interest. It must not be imagined, however, that they have no variety of their own, for Johnson, writing in 1633, professed to have sixty rare sorts in his own garden, and more coming in every year. They, however, still make great use of the Damson, that being almost the only market plum cheap enough for the common people. To some of our most noteworthy kinds we have given our national names, so that they are readily recognizable, as the Washington, Jefferson, Columbian, etc. But none of these seem to serve a good purpose for drying, or is it because we are too busy to undertake the making of

PRUNES?

All this sort of dried fruit comes to us from France and Germany, made from sorts not in common cultivation here. Doubtless this, as well as the cheapness of labor there, has something to do with the fact that they can raise plums, dry them and send them here and then sell them at prices so low that we do not think of competing with them.

The plums when gathered are laid on lath

or wicker-work frames some days in the sun, and then they are repeatedly placed in moderate ovens for a day at a time until dry. The operation is quite a nice one, and subject to variations according to the degree of finish the quality of the fruit demands. The finer sorts are picked before sunrise, touching only the stem, and placed in baskets where they do not touch each other, and dried very carefully for some time in the sun first, and on the whole with less oven heat than the others. These retain their bloom after they are dried. With some they even take the pains to round them out by turning the stone when they are half dried. Still others are made from very choice fruit—the large yellow Brignole plum. These are shaken off the trees, and the second day they are skinned by the nails of women, so that no metallic instrument may mar their color and transparency. After drying several days, they are stuck upon the points of osier rods several days more, then their stones are extracted, and they pressed into shape and placed in wicker baskets—"a super-excellent sweetmeat," doubtless what we call "prunelles."

The now common "French prunes" have been but recently introduced into common use in this country. They are a little higher in price than the old "Turkish" prune, but much less expensive on the whole, since they require no sugar to fit them for table use, and some are even sweet enough to cook with sourer fruits. They are also much larger and richer. In marketing they are assorted according to their sizes, the largest counting only from forty to forty-five to the pound, while the smallest range from ninety to ninety-five, and the prices vary accordingly. This is the explanation of the figures we sometimes see attached to the market quotations of prices for French prunes. It is desirable to understand this if you would be able to criticise the prices your grocer may ask for his prunes. He may have an article of which from fifty to fifty-five will weigh a pound, and for which he will therefore ask from six to eight cents more than his neighbor, whose prunes are so small that it takes nearly a hundred of them to weigh a pound. The numbers will usually be given to customers who ask, or you can read them on the boxes. The so-called Turkish prunes come unassorted in casks and barrels, and at about two-thirds the price of the smallest French prunes.

THE APRICOT

is sufficiently a plum to be consorted therewith, though a separate species. It has been described as a small peach with a plum stone. This answers to the eye. It ripens earlier than the plum and earlier than any but the earliest peaches, making its appearance in the markets in July, just after the height of the cherry season. It looks like a little delicate peach—color, down, and all—being seldom over two inches in diameter—most of the sorts only one and a half inches. Its blossoms are white, and its stone is smooth, like that of the plum, and in some of the varieties, at least, it is of a peculiar olive color. It is a good keeper. It is also a hardy tree up to 42° north latitude, and indeed many are raised north of that. It is sometimes grafted on the plum stock, though it does well on its own, and there appear to be no reasons why it can not be cultivated wherever the plum will flourish. It is a delicious dessert fruit, but so little known that the few which are brought to the city markets are unappreciated. We must add, however, that we have never seen them at any but exorbitant prices. Doubtless, any one who should take a little pains to push them might do well by them. Certainly those who have gardens of their own ought not to neglect so handsome a tree and so delicious a fruit. They are to be treated in the main like the plum, with the same care to avoid the curculio, to which they are subject. For other points see fruit-books.

It is a native of Asia, and one kind grows wild in Siberia. It is a great favorite in China and Japan, where it also grows wild on the mountains, but it attains its greatest excellence in Persia. In the flowery language of that land, the apricots of Iran are called the "Seed of the Sun." Another sort is cultivated for its sweet, nut-like kernel, to which the tree has imparted the excellence usually bestowed on the pulp. The apricot is a favorite in France. It was introduced

into England in the time of Henry VIII., where they now cultivate twenty varieties. In our own country it is cultivated in Delaware and Maryland and upon the banks of the Hudson.

WHOLESOMENESS.

More fault has been found with the plum than with most other common fruits on this score. Possibly one reason is that, with the Damson and the Green Gage, and possibly some other varieties, it is not easy to decide when they are quite ripe, and unripe plums are certainly unwholesome. In English child-literature, sickness from eating plums is one of the favorite modes of punishment for bad boys, especially if they stole the plums. It doubtless is a natural result of the circumstances. Boys, never very discriminating of the ripeness of fruit, would be less so under such circumstances—might even eat an undue quantity to get them more promptly out of sight—*hinc illae lachrymæ;* but is it not a pity to put it all on the "plums?" what a bad fruit, to be sure! On account of this badness perhaps they are counted good as a medicine—hence the "medicinal prunes;" or does drying and exporting and cooking change their character? Certain it is that the "Turkish" prune is considered slightly laxative, and therefore wholesome in cases of constipation; an excellent food in cases of convalescence from fevers, etc. Well, we do not take much stock in the "medicinal" part—a good food when ripe, but most varieties requiring stronger digestive powers than some other fruits. Both kinds of prunes being well ripened and cooked, are easily digested; and plums generally, if well ripened and eaten at meal times with food, would, with most people in ordinary health, prove acceptable. Still it should be noted that the fresh fruit, from its peculiar character, does not admit of so ready mastication as some other fruits, and more care should be taken in this respect. It is not easily divisible, like raspberries, which can be separated without the aid of teeth; nor crisp and easily chewed like the apple, while it is easily swallowed and liable to slip down in masses. It is for this reason not so suitable as many other fruits for children, nor for adults who will not recognize the peculiarity and masticate carefully. Through lack of recognizing this fact, many have supposed that the wholesomeness of the plum is increased by cooking. Like most other fruits, we believe it to be more invigorating and refreshing when eaten uncooked; but since proper mastication is indispensable, or rather since it must be finely divided, so that the gastric juice can have free access to every part, if this process be not accomplished by mastication, it is better to have it secured by

COOKING.

Plums require cooking longer than many other fruits. It will not do to merely scald them, as we do raspberries or currants; they must be cooked until they are tender—and this must be determined by trial—not going beyond, for this will waste the aroma. For the same reason the cooking should be slow and gentle. The English method of "baking" them is very good, putting them into a covered jar in a moderate oven and cooking them slowly until tender, though it may be doubted if it require so long a time as the five or six hours they sometimes allow. Prunes also are very frequently deteriorated by cooking them too furiously, or they stop short of the object to be attained by not cooking them sufficiently. An hour is usually none too long. In making "preserves" (their frequent destination), they are made still more difficult of digestion, since the added sugar must be dissolved out, so we will excuse the preserves. Sweet plums and peaches harmonize well when cut up together, and the same may be said of plums and grapes stewed together.

ECONOMY.

In some seasons the low prices of prunes have induced large consumption among poor people, but the Turkish prune, in spite of low figures, is a costly dish. It does not swell in cooking so much as many other fruits, and it requires much sugar. At ten cents per pound it costs more than dried whortleberries or black raspberries at forty cents per pound. French prunes are cheaper at one-third higher price, but they are not nearly so economical as Zante currants, nor are they so appetizing.

RECIPES.

CANNING PLUMS.—It is not customary to stone or peel plums for cooking or canning. Never cook them in metal, always in earthenware, porcelain-lined utensils, or granite ware. Fill even full of water, cover close and cook gently, until you can pierce them with a straw. Dip them into the cans carefully to avoid breaking them, and seal as you would any other fruit.

PLUM AMBROSIA.—Damson plums may be made up in ambrosia the same as cherries (see PHREN. JOUR. for July); the larger kinds, if not very juicy, may be sliced up and made into ambrosia the same as sliced apples or peaches. But do not undertake to stew them for this purpose, nor put in any juice, since this will be sure to make the dish heavy. It will require care in baking—a steady, gentle heat, and longer cooking than for cherries. Do not try to have it less than three inches deep, and do not permit the juice to run out of the dish.

DRESSING PLUMS.—The more tender plums, and especially those with delicate skins, can be cut up for sauce either by themselves or mixed with peaches or tomatoes. The better way, however, is to eat them without the intervention of knife and spoon.

PLUM PIE.—Cut the fruit in two or more parts, remove the stones, and stew until tender in water sufficient to nearly fill, but not to cover it. Then prepare an oatmeal crust by wetting one pint of "A" oatmeal in one gill of water, fill it up with the fruit, season to taste, and bake until the crust is done, say fifteen or twenty minutes. If you wish more crust, sprinkle the fine oatmeal thickly over the fruit before baking. Another method is to sift the fine dry oatmeal over the pie-dish for an under-crust, place the fruit on this and pour on the juice, baking as above.

PRUNES.—Look over, wash, and put to cook in about twice their measure of water, cook slowly and gently nearly or quite an hour, or until they are readily pierced by a straw. If they are the "Turkish" prunes, they will hardly be palatable without some seasoning or sweetening. If they are the French prunes, of good quality, they may even be too sweet. In that case they may be stewed together, or the French prunes may have added to them an equal part of acid dried apples, or half that amount of fresh rhubarb, or one-fourth part cranberries, so timing them that they will be done about the same time.

JULIA COLMAN.

RECORD OF SCIENTIFIC DISCOVERY.

Condition of Jupiter and Saturn.—Prof. Proctor finds it necessary to defend his views on these planets, they having been attacked by Prof. Vogel, whose researches bearing on the light of Jupiter and Saturn won a prize from the Copenhagen Academy. The attack was based on the evidence that the spectra of bands and lines in those plants were similar to those of our own atmosphere, occasioned by the presence of aqueous vapor. Prof. Proctor argues with force against the conclusion that aqueous vapors constitute the chief envelope of the larger planets. According to the accepted theory of their formation, those planets are much older than the earth, but Prof. Proctor shows, by estimate, they have not yet had time to cool, owing to their enormous bulk. Their lack of density can be best explained by supposing that their condensation is still prevented by internal heat. Such atmospheres as they evidently have would be, unless continually expanded by heat, compressed and solidified by the gravity of such great masses. The cloud-belts present aspects and changes which can be explained best if we believe that they exhibit the surface of up-rustling heated vapors, with cloud-like summits. These clouds and belts bear no relation to the diurnal or annual exposure of the surface to the sun's rays, and hence their changes must be referred to local causes. The outlines of these planets have frequently been noticed as varying from a circular form, and a satellite occulted by the edge of the planet has reappeared briefly, just after concealment; such facts may be readily explained if the surrounding atmosphere is more than 2,000 miles deep, and is subject to great mutations. Finally, the light of the planets is two and one-half times greater than that which pure sand-stone would reflect; hence it seems probable that they produce light. Prof. Proctor thinks that those planets will not be in condition to support life for many millions of years.

Proximity of Mars to the Earth this Year.—This month will be signalized by an unusual occurrence, viz., the planet Mars will during its opposition of the 5th approach within thirty-four millions of miles of our globe, and will be conspicuous for its brightness. Astronomers tell us that the average distance between Mars and the earth at the moment of opposition is about forty-nine millions of miles; if, however, the opposition happens when the planet is as far from the sun as possible, and the earth as near the sun as it can be, they will be separated by a space of sixty-four million miles, and if, on the contrary, the event occurs when the conditions are reversed, the distance between them will be only thirty-four millions,

and the opportunity for observation will be exceptionally favorable. These close oppositions are rare, the motions of the planet and the earth being so related that they recur only at intervals of seventy nine years, though some of the intermediate oppositions, separated by periods of fifteen and seventeen years, are not very greatly inferior. The opposition of September will be one of the best possible, both earth and planet being nearly in their most favorable positions, and the distance between them less than at any time since the summer of 1798. Important observations will be made for the purpose of determining the distance, position, and motions of the planet, and to note its magnitude, form, rotation, surface-markings, and physical constitution. Observations of the opposition of Mars are available for the same purpose as those of a transit of Venus, and some astronomers consider them capable of giving a result hardly, if at all, inferior in certainty and precision.

Recent Researches as to the Structure of the Spinal Cord.—MM. Sappey and Duval have recently published a very important paper as to the structure of the spinal cord in vertebrate animals, and particularly as to the course of the fibers. Up to the present date, microscopic observers have not been able to trace the white columns of the cord through the medulla oblongata and the pons varolii. MM. Sappey and Duval believe that they have finally succeeded in following the fibers from the core to their entrance into the optic thalami and the corpora striata. The reader is aware that the fibers of the cord are divided by anatomists into the two anterior, the two lateral, and the two posterior white columns. The two former decussate with each other throughout the whole length of the cord. This decussation ceases as they enter the medulla oblongata, and they run separate, but parallel, gradually inclining backward until they appear on the posterior face of that body, where they form two slight longitudinal protuberances on the floor of the fourth ventricle. From these protuberances they traverse the pons varolii, enter the crura cerebri, and finally become involved in the structure of the optic thalami. The two lateral columns decussate just below the medulla oblongata, the anterior and posterior columns taking no part in this decussation, which is effected by the giving off from each of successive flattened bands. The most internal layers approximate to the central canal of the cord, deeply grooving the anterior horns of the gray matter, and ultimately, as they ascend, weaving a network over them. After decussating, the fibers ascend parallel to each other on either side of the anterior middle fissure, and form the superficial portion of the pyramidal bodies. not the whole of them. On tracing these fibers upwards, they are found to traverse the pons, and to enter into the structure of the corpora striata. The two posterior columns decussate higher up than the lateral. This decussation is effected by a breaking up of each of the columns into twelve or fifteen fasciculi which cross to the other side, forming the triangular raphé mentioned in anatomical treatises, which separates the anterior internal columns of the pyramidal bodies. In ascending through the pons varolii, these columns send fasciculi to the tubercular quadrigemina. They then form the most outer portions of the cerebral crura and penetrate the optic thalami. With these facts in mind, and remembering that the great nerve of the leg springs from the lateral column of the spinal cord, it is now clear that the corpora striata are specially concerned in movements of the leg, and hence in locomotion. As the great nerve of the arm springs from the same column, it is also evident that movements of the arm are similarly dependent on integrity of function in the corpora striata, which are, as Gall and Spurzheim demonstrated them to be, the great ganglia of voluntary motion. The foregoing statements will not be new to followers of Gall and Spurzheim, and they are detailed only to show how slow medical men have been to accept the great anatomical researches of the founders of Phrenology, and how frequently their statements are verified by physicians and announced as new.

F. G. FAIRFIELD.

Lenses and Blood-Corpuscles.—*To the Editor of the* PHRENOLOGICAL JOURNAL: In the August number of the JOURNAL I find a note from Mr. Phin, impugning certain propositions contained in a little article of mine on the structure of blood-corpuscles. As the main evidence of my statement, that they are simple globular bodies, rests upon direct observation with good objectives, and as the point is practically conceded by German authorities, there is no exception to be taken to the criticism that disk is not a proper term. Any one who has, with good lenses, studied these bodies in motion, will agree, I think, that the general opinion as to their structure is fallacious. The proportions of slide, cover, corpuscle, and mirror, presented in the cut published in the July issue, were not intended to be accurate, since accuracy was impracticable within the limits usually given to a cut, and the only purpose was to present the theory clearly. Mr. Phin can, however, satisfy himself as to the theoretical exactness of the principle he denies, by experimenting a little with convex lenses. Theoretically, although there is a trifling variation in practice, the focal distance of a single convex lens is equal to the diameter of the sphere of which it is a plano-convex section; that of a double convex lens being equal to half the diameter of its sphere. The rest follows naturally. The principle is so simple and well verified that every lad of twelve years old knows it; and I may add that all the optical principles involved in the construction of the compound microscope are perfectly familiar to men but rudimentarily acquainted with science. I have lying by me as I write, Nageli and Schwendener's admira-

ble work, *Der Mikroskop, Theorie und Auwendung Desselben*, a perusal of which will show any one the soundness of my position. As to the experiment he proposes, let me substitute a more conclusive one, that approximately answers the conditions of the problem, in place of the clumsy and inexact boys' play with a glass bulb filled with salt and water. A minute sphere of tinted glass, mounted in balsam, within a deep rubber cell cemented to a slide and covered with an ordinary cover, imitates the conditions of the case with sufficient exactness, while the tint enables the observer to verify the theory I have advanced. On slowly raising the objective, by means of the micrometer adjustment, a tinted ring appears, which is succeeded by a tinted luminous point where the rays cross, and this, again, is succeeded by another ring. Now, measure the distance traversed by the objective in bringing the second ring into view, after the luminous point has been observed at its best, and it will be found to be an equivalent in distance for half the diameter of the pellet. Or, again, view the pellet illuminated by an unprotected gas-jet, and the brilliant point consists of a minute image of the flame.

F. G. FAIRFIELD.

The Phytolacca Electrica, a plant lately discovered in Nicaragua, gives a shock to the hand when one attempts to break off a branch.

Meteorological.—The month of May, this year, was, in some respects, one of the most remarkable in American experience for many years. According to the report of the Chief Signal Officer of the War Department, its most interesting features were:

First. The remarkably high temperature from the 18th to the 24th;

Second. The heavy rain-fall west of the Mississippi and the drought in California; also the light rains in the Lake region, and the forest fires in Michigan and New York;

Third. Injury done to grasshoppers in the West and South-west by cold and rainy weather;

Fourth. The earthquake of Iquique, and the ocean wave resulting therefrom, also similar wave on the 15th on Lake Erie;

Fifth. The aurora of the 28th; and,

Sixth. Tornadoes and hail-storms in New York and New England on the 18th.

Among the more noticeable comments and extracts included in the report are the following:

Wet Bulb Thermometers.—From a series of observations on the accuracy of wet bulb thermometers under different conditions, Messrs. Marriott and Ward deduce the following conclusions as a contribution to hygrometry:

First. The accuracy of the apparatus depends most upon the kind of muslin and the conducting thread leading to the water reservoir; those thermometers having thick muslin read too high and are less sensitive; in calms, all wet bulbs read alike, but when a breeze springs up, thin muslins will drop down a degree in a few seconds, while thick muslins and lamp-wicks require one or two minutes.

Second. The dry and wet bulbs should be of the same make and size—cylindrical bulbs are much preferable to spherical ones; it would be a great advantage if the muslin wrapping could be replaced in any way by a roughening or frosting of the glass bulb.

Third. The open water reservoir should not stand near either bulb, otherwise they would be seriously affected, and the water cup should be covered over, having only a small orifice for the conducting thread; the wet bulb covering should be of very fine muslin or linen and changed once a month or oftener, and during very cold weather the muslin covering should be dispensed with, provided a proper coating of ice can be obtained on the naked bulb.

Fourth. When the muslin covering is to be changed the bulb should be cleaned by washing in dilute sulphuric acid.

An American Substitute for Gum-Arabic.—It is said that the mesquite gum of Western Texas is almost identical with gum-arabic, and, during the past year, has become an article of export, some twelve thousand pounds having been gathered in Bexar county, and as much more between that and the coast. This gum exudes from the stem and branches of the mesquite, a mimosa, several species of which grow in Texas, New Mexico, and Arizona.—*Journal of Microscopy.*

A Tunnel Greater than Hoosac.—Baltimore is constructing the longest tunnel in the country. When completed it will be seven miles long, circular in shape, and twelve feet in diameter. Five miles of the distance is through very hard rock, and the drilling is done by manual labor, powder drills being impracticable in such a small space. The rest of the wall will be bricked. Fifteen shafts have been sunk. The cost is estimated at $3,000,000; about 1,500 men are employed, and the tunnel will probably be completed in three years. The object of the tunnel is to supply the city with water, the present supply having proven inadequate and of wretched quality.

Still Another New Metal.—This metal has been named Lavœsium by its discoverer, M. Prat, in honor of Lavoisier. In color it resembles silver; it is fusible and malleable. Its crystals are colorless, and its distinctive characteristics, according to M. Prat, are—its silver color, the nature of its spectrum, the solubility of its oxide in ammonia, the peculiar color of its combinations with the ferro-cyanide of potassium, and with sulphureted hydrogen. With the spectroscope the metal gives twenty-three lines, several of which coincide with those of copper, whence M. Prat conjectures that copper may contain it.

AGRICULTURAL HINTS.

[The mind is the man. Farming, in the highest sense, is not simply doing the hard work necessary. This can be done by muscle when directed by brains. The true farmer is he who can plan, direct, and control skillfully.]

As this department is one which should contain the most recent gleanings of wisdom and experience, ur readers and friends in the rural districts are invited to send us any items of value to agriculturists in general, and which should have a wide circulation. Due credit will, in every case, be given to the contributor.

More on Hygienic Tilth.—This letter explains itself:

"*Editors Western Rural:*—In your issue of April 14th there is an inquiry from 'J. H. F.,' Hampton, Minn., in reference to green manuring. This is a question of no small importance to the farmers of the West, as green manuring affords a prompt remedy for some of the evils of which our lands complain. I have had some experience in the matter, and will give it for the benefit of others, if it will do any good.

"In this vicinity our soil is a clay loam which packs down pretty hard under the heavy spring rains, when exhausted of its organic matter.

"A neighbor of mine bought a field, a portion of which had been cropped annually until it was pronounced 'worn out.' The ground was hard and lumpy, and had been skinned in sections until no one could undertake to skin it again. He plowed and sowed it, and seeded it to clover. The season proved favorable and he got a little wheat and a good stand of clover.

"I had advised the plowing in of a green crop, but had told him that Western farmers held that 'A bird in the hand was worth two in the bush,' and that none of them would plow under a crop that seemed worth anything, for fear that they could never get it back. He sowed plaster and secured a fine growth, which he cut for hay.

"The second crop was also good and he went to plowing it under. I came along while he was at it, and examining the clover, found it heavily seeded. 'Hold on,' said I, 'you can not afford to plow under all this seed.' Said he: 'You told me that if the crop was good for anything I would take it off, but I made up my mind that it should go under, and here it goes' The result has been that his soil is light and mellow, and he harvested a magnificent crop of corn last fall. His crib is now full."

Value of the Earth-Worm.—The common earth-worm, though apt to be despised and trodden on, is really a useful creature in its way. Mr. Knapp describes it as the natural manurer of the soil, consuming on the surface the softer part of decayed vegetable matters, and conveying downwards the more woody fibers, which there molder and fertilize. They perforate the earth in all directions, thus rendering it permeable by air and water, both indispensable to vegetable life. According to Mr. Darwin's mode of expression, they give a kind of under tillage to the land, performing the same below ground that the spade does above for the garden, and the plow for arable soil. It is, in consequence, chiefly of the natural operations of worms that fields which have been overspread with lime, burnt marl, or cinders, become, in process of time, covered by a finely-divided soil, fitted for the support of vegetation. This result, though usually attributed by farmers to the "working down" of these materials, is really due to the action of earth-worms, as may be seen in the innumerable *casts* of which the initial soil consists. These are obviously produced by the digestive proceedings of the worms, which take into their intestinal canal a large quantity of the soil in which they feed and burrow, and then reject in the form of the so-called casts. "In this manner," says Mr. Darwin, "a field manured with marl has been covered, in the course of eighty years, with a bed of earth averaging thirteen inches in thickness."—*Encyclopedia Britannica.*

Two Good Things.—EDITORS JOURNAL: I have lately learned how to do two things properly, and the knowledge is so valuable that I desire to give the public the benefit of it through the PHRENOLOGICAL JOURNAL. The first is—

How to Build a Cistern.—The main object in building a cistern is to have a plentiful supply of water, and the next is to have that water good. Dig, as for an ordinary cistern, in a round or oval shape, to a depth according to size, of from sixteen to twenty-four feet. Let the sides be trimmed smooth and truly perpendicular, and the bottom hollowed out a foot or fifteen inches, to facilitate cleaning. The sides may be walled either with brick or small flat stones—the latter are preferable—using good mortar, and smoothing well on the inside. The bottom should also be strongly plastered. So far we have a good and durable cistern. But we want the water filtered. Many modes, costly and otherwise, have been practiced; but the best, the easiest, and most economical, is to build a brick wall through the center, laying the bricks flat lengthwise of the wall, one thickness only, and using good lime mortar. This wall must not be plastered, as it is to act as a filter, for which purpose only it is built. The water must be let in on one side and drawn out from the other side. This is an admirable filter, and will keep the water clear and pure for years. If the cistern is a large one, it would be well to build this center wall a little rounding toward the side the water is to come in; as during heavy rains the pressure might be too great for a straight

wall. For a small one, the straight wall is amply strong.

The other good thing is—

How to raise an Osage Fence.—Where our climate is not too severe, the Osage Orange has been proven the best material for a live fence. The great trouble with it, however, as with all live fences, is to get it started with an even thickness along the row—as plants here and there will fail to grow. Hence resort has been had to cutting off at the ground, or to bending down or plashing, to remedy this difficulty. The mode I have lately learned, and which I think is far better than all others—though it may not be new to many—is to allow the new hedge to grow, say three or four years, or until the stems will measure an inch in diameter or more at the ground. Then, early in the spring, cut off all the branches close to the body; clean out the row of all rubbish and all the branches; saw each plant partly off at the ground, and bind it down in the row, and peg it there, following the row until all are cut and neatly pegged to the ground, overlying each other. Many persons have practiced cutting and bending down, but have omitted to trim off the branches, and have had poor success. It is this trimming that insures a growth of new wood all along the line and makes a hedge that a rabbit can not pass through nor a bullock go over. Cultivate well and trim into proper shape annually. P. G.

Stock Water.—How a reserve of stock water may be economically stored up for use during droughts, is an important question for farmers throughout the prairie region of the West. A correspondent of the *Prairie Farmer* offers some suggestions which should enlist attention:

"Two years ago last summer, having, with many others, suffered the inconvenience of a failure of the water supply on my place, in consequence of the long-continued drought, I dug a two-hundred-barrel cistern in my pasture a few feet from a ditch which crossed one corner, cementing on the solid clay, which formed the sides to within two and a half feet of the top, and bricking the balance. I laid a wooden pipe from near the top of the ditch to the cistern, and when the water was running the following spring, by damming the ditch below, it was filled with pure snow water. The same process was repeated last spring, filling up what had been used out the previous summer.

"For the last month my well has been nearly dry, and my house and barn cistern both empty. Without this reserve supply, I should have been in as bad a fix as are a great many other people at this time. The water in this cistern, most of which has been in for two years, is now as pure, bright, and sparkling as when it was first filled. It has been a wonder to me that farmers in sections where reliable wells can not be obtained, have not availed themselves of this method of storing up water. There is no limit to the extent to which such cisterns can be multiplied, furnishing a reserve supply to fall back upon when the ordinary supplies fail."

Cutting Back Young Trees.—We observe that mistakes are still made by some who set out young trees, and who are nevertheless not aware of the importance of reducing the heads to correspond with the unavoidable reduction of the roots in taking up. The trees are set out, and the cutting back is put off till the new leaves are partly out. To do it then will do more harm than good. If not performed before the buds open, it should be entirely omitted. Growth is always checked by pruning when the leaves are opening or expanded. We have seen good trees nearly ruined in this way. If the operation is not already done, let all the leaves and roots remain, and make up for the neglect by keeping the surface of the soil for several feet about the tree constantly mellow, mulching with manure as hot weather approaches, and if the weather should be very hot and dry, daily showering the leaves, branches, and stem. This showering should be regular, not occasional. There is a difference in different kinds of trees as to the amount of injury caused by cutting back too late. Peach trees will withstand the effects of such treatment better than most kinds; apple trees not so well; cherry trees worst of all—we have seen them actually killed by it.—*Country Gentleman.*

Rat-Proof Granary.—The *Inter-Ocean* has the following advice to give: Place posts far enough in the ground to insure the stability of the building without braces, and extending three feet above ground. Reduce the tops of the posts to five inches diameter and place on the top of each a circular piece of inch board twelve inches in diameter, planed on the under side. Now place the sills on the circular pieces, and when the building is completed, tack around each circular piece a strip of tin three and a half inches wide, which will cost in Chicago four or five cents each, and, as will be seen, can be replaced at any time without disturbing the building.

The accounts received of the peach crop in New Jersey are encouraging; and it is estimated that it will reach as high as 18,000,000 or 20,000,000 baskets, and the farmers of the State are highly elated. It is proposed to repeat the experiment of shipping them to Europe this summer.

Reducing the Cost of Washing.—The expense of cleansing the linen of a family is an item which in the course of a year assumes considerable proportions, and in many cases bears heavily upon the income of paterfamilias. Hence any new process which will reduce the cost and produce as good results as the old way, is heartily welcomed by housekeepers. From France, that home of the true *blanchisseur*, comes the good news that the expense of washing may be reduced to an average like this: Five centimes

(one cent) for a pair of drawers, two and a half centimes (half cent) for each shirt, and so on. This is the process: One kilo (two pounds) of soap is reduced with a little water to a sort of pap, which having been slightly warmed, is cooled in forty-five liters (ten gallons) of water, to which is added one spoonful of turpentine oil and two spoonfuls of ammonia; then the mixture is agitated. The water is kept at a temperature which may be borne by the hand. In this solution are introduced the white clothes, and they are left there two hours before washing them in soap, taking care in the meantime to cover the tub. The soapy water may be warmed again and be used once more, but it will be necessary to add half a spoonful of ammonia. Once washed in soap, the clothes are put in warm water and the blue is applied. This process, it is obvious, spares much time, much labor and fuel. On the other hand, it gives to the clothes a whiteness much superior to that obtained by any other method, and the destructive use of the beetle is not necessary to clean the clothes from the impurities which they contain.

MRS. C. FOWLER WELLS, *Proprietor.*
H. S. DRAYTON, A.M., *Editor.* N. SIZER, *Associate.*

NEW YORK,
SEPTEMBER, 1877.

REVIEWERS' PERSISTENCE IN ERROR--No. 2.

IN our last number we endeavored to show how wide of the truth certain critics wandered in their discussion of Phrenology, because of their taking for granted a statement which has little or no anatomical warrant, so far as its relation to the phrenological distribution of organs is concerned. To the reader who has just entered upon the study of the phrenological system, the grave critic who proceeds to demolish it from the text that it places the animal propensities in the posterior lobes, can but appear in a ludicrous light, since a little investigation would have enlightened them, and saved them from expending time and thought in a fruitless argument.

Dr. Carpenter showed, they tell us, some thirty years ago, that "the first rudiments of brain found in ascending the animal scale, were rudiments of the anterior lobes." This is the leading one of the propositions which have so tremendous an effect when applied to the system of Gall and Spurzheim, in the opinion of the antagonistic reviewers, that it "crumbles into dust." Obviously enough the lower organisms have brains, whose chief functions relate to the preservation of individual life and the perpetuation of species. No one acquainted with the nervous anatomy of the lower animals can deny this. The phrenologist certainly has been one of the first to affirm it, but he has not fallen into the error of assigning to the elementary brain of an earth-worm, or a fish, or frog, or mole, the relation which the anterior lobe of the human brain bears to that cerebral mass.

Neither practical investigation in the structure of the brains of the lower animals, nor logic, sustain the view that in the advancing order of nervous development the cerebrum appears by lobes, first the anterior, then the middle, then the posterior. Were this the case, we would not expect to find a cerebellum in so low an animal as the frog, as we do, and that well defined.

Each animal has a complete nervous system, a brain sufficient for the performance of the functions appertaining to its sphere. If we examine the brain of a frog

we find a clearly-outlined cerebral mass, with a central fissure imparting the hemispherical character. So, too, the brain of small fishes show a cerebrum. An eminent French anatomist, M. Serres, records it as an axiom, that "the encephalon of all vertebral animals is constructed after one uniform type, and with the same elements," and M. Cuvier writes: "The brains of the mammalia have the same parts as that of man."

Both savants overstep the bounds of fact in their assertion of a principle which relates rather to form than to distribution, it being plain that the high mental capacity of man and the multiplex variety of his relations and conduct require a great number of cerebral elements, or nervous centers, while the rabbit, pigeon, or guinea-pig, with a life concerned almost entirely in mere subsistence, requires comparatively few.

The earth-worm is a digesting machine, and its cerebrum consists of scarcely more than an olfactory center, or an organ whose function is that of alimentation.

From the worm up, the cerebral mass increases by the addition of nervous centers, with their related functions, and in accordance with the prominence of some characteristic in an animal, we find a marked development of its corresponding nervous center.

The bee, and fly, and other insects remarkable for their complex eyes and coincident power of vision, have a good part of their brain taken up by a ganglionic mass corresponding with what is known in the human cerebrum as the optic thalami, (Fairfield). The squirrel, whose secretive and providential habi s are well known, has a wide brain, with a marked nervous development in the region we would naturally assign to Cautiousness and Secretiveness. The experiments of Ferrier have shown the correspondence of nervous centers in animals of the same species, and go far to show that the lobular theory can not be applied to the smooth-brain classes. The notion that "the first rudiments of the brain were rudiments of the anterior lobes" seems to us to be due mainly to the impression derived by the early physiologists, from the position of the parts of the brain in the crania of animals low in the scale of development. In these the important parts lie in a line; first the olfactory bulb, next the cerebral mass, then the optic bulbs, and last the cerebellum. With the increase of intelligence the nervous development is chiefly shown by the cerebral mass, which extends both anteriorly and posteriorly, until in mammals, like the seal, bear, cat, and others, the olfactory and optic bulbs are covered by it, and finally in man the cerebellum is completely within its posterior border.

A comparison of the human brain with that of the highest quadrumana, like the dog and ape, shows that the difference consists mainly in the development of the anterior and middle surfaces; in the depth and number of the convolutions. The human brain projects forward in a marked manner, and is characterized by a special elevation, thus indicating the possession of nervous and mental qualities unknown to the quadrumana. They who are familiar with different species of dogs, know that the intelligent greyhound and St. Bernard not only possess more brain than the ferocious bull-dog or mongrel, but that it gives to their heads a superior elevation and conspicuous signs of intelligence. The broad head of the bull-dog indicates a cerebrum correspondingly broad, and the large propensitive organs which are salient enough in its disposition. The St. Bernard

may have a brain equally broad, but its greater development in the upper and forward parts supplies qualities which offset, to a degree, the influence of the basilar organs, and contribute to its well-known reputation for sagacity and gentleness.

The writer in the *Church Quarterly Review* thus expresses himself in one place: "For the dependence of memory on the integrity of the material substance of the brain, there is abundant evidence, though but little success has yet attended the efforts of physiologists or physicians to connect it with particular parts of the cerebral mass." Now much of this "abundant evidence" can be found in the recorded cases of the disease known as *aphasia*, wherein the lapse of memory relates to the use of suitable words to express a patient's thought.

The thing in itself is remembered, but its name may not be recalled. The disease or derangement, therefore, affects the organ of verbal memory, and physiologists, not phrenologists, have pretty well agreed on the location of the organ or center which has to do with this verbal memory, viz., in the third frontal convolution of the left cerebral hemisphere. Some are disposed to associate a center with a similar function in the right cerebral lobe.

Furthermore, the experiments of Flourens, Vulpian, Goltz, Hitzig, Ferrier, and others, who have had much to do with supplying this "abundant evidence" the reviewer speaks of, certainly indicate pretty clearly how the loss of a given part of the cerebrum affects the conduct of an animal.

On the whole, the position of these gentlemen who have reviewed Phrenology lately, is very much like that of the "anti-theists" of the day, who reason from the assumption that social morality is an outgrowth of experience, and not due to the impression of religious belief upon human conduct, and has no rule or standard of authority to which the quality of acts may be referred, and yet, in their reasoning, call one way of living mean and hateful, and another way of living noble, blessed, admirable, all the time apparently oblivious of their flagrant inconsistency. (See Mallock in *Contemporary Review* for January, 1877).

The reviewer, for instance, in discussing "unconscious cerebration," is led to say: "Anyhow, the extension to the brain of the principle of reflex action—now well established in regard to the lower centers of the nervous system—implies that the reaction of the cerebral substance from the impression made on it by the organs of sense may become at once the cause of appropriate bodily movements, which will, of course, be the expression of thought and feeling, if there is thought and feeling to express, but which may also occur independently of these, when, by diversion of the attention, the appropriate mental state has not been aroused." And a little further on, "But admitting as a matter of fact that cerebral changes are followed by mental states, there seems to be quite as much evidence for attributing our ideas and memory of words to the working of the cells and fibers in the anterior region of the brain, which represent movements of articulation as in ascribing our notion of the visible picture of nature before us to the molecular changes transmitted to another part of the brain lying farther back from the optical image formed in the eye."

The writer here goes so far in his inferences as to trend upon the borders of the coldest materialism, although in the same connection disclaiming no part in such councils, and apparently forgetful that his admissions embody a practical confirmation of the organic constitution of the brain.

THE CONFLICTS OF LABOR AND CAPITAL.

IS it at all strange that the men whose intelligence and muscle perform the practical labor in the operating of a railroad should combine against the directors and officials thereof, when the latter, in the exercise of arbitrary power, cut down the wages of the former, apparently disdaining an inquiry into the justice of such a measure, and when the asserted occasion for it, financial disability, is really due to directoral mismanagement or official cupidity?

There is certainly some warrant for the protest of the engineers, the firemen, the brakemen, whose vocations are perilous to life and limb, and require them to face every atmospheric condition, however inclement, when they see the clerk or official enjoying a position of leisurely ease in a luxuriously-appointed office, with a salary so large that it enables him to maintain a princely domestic establishment, while they who bear the burden and wear of the railway business must be promptly and regularly at their places day and night, and be contented with the wages assigned them, whether adequate or not to the comfortable maintenance of their families.

Is it at all strange that there should be uprisings—or revolts, if you will—on the part of the workingmen, and menaces which strike terror to the hearts of them who live in luxury, and bear themselves superbly on account of their wealth, when through newspaper and books, by the demagogue and the patriot, the doctrine of equal rights is loudly proclaimed, and the very grandeur of our national prestige is founded on the declaration, "All men are born free and equal?"

When these workingmen see this principle practically ignored by the master-employer in the shop and the factory, on the ship and the railway, and a class strong and imperious, because of its wealth, contemptuously regarding the poor artisan and laborer, their demand for justice can not be deemed unreasonable.

When capital imposes heavy burdens, grievous to be borne, upon the broad shoulders of labor, has not labor a right to remonstrate? Has not labor, in this "glorious free land," a right to question the nature of the work offered for its performance? Can wealth dictate? and must poverty always submit?

The reasonable answers to these questions are obvious enough.

We are not counselors of violence. We have no sympathy for the disorderly acts of an excited mob. We believe in the majesty of the law, and would have it properly and promptly asserted in every lawless movement, for when anarchy prevails, the original motive of the rising is lost in the indiscriminate conduct of a reckless mob, and wholesale violence is committed.

As American society at large is constituted, especially at the present time, the workers in no important branch of industry can organize and put in operation a strike without finding themselves reinforced and embarrassed by an eager throng of the shiftless and idle, who are ever on the watch for an opportunity to fill their stomachs and pockets with the property of others. The late extensive revolt of railroad employés is a marked exemplification of this; the grave complications and terrible disasters to life and property arose from the part taken in the strike by thousands of ruffian vagabonds. This phase of a labor movement against the exactions of capital attaches a special responsibility to the actors in it, and should compel the utmost deliberation for the sake of their own best interests. They may disclaim affiliation with

the rabble, but the law-abiding citizen, seeing the physical and moral support given by the mob passively accepted by the strikers, feels compelled to treat both classes as making common cause.

Treating the matter from the side of right reason, the conduct of those men who demand higher wages is not altogether above reproach, in that they ignore the right of other men to accept the wages which they refuse. They can not plead ignorance of duty, or want of intelligence. They know clearly and certainly that a man can, if he choose, decline to accept the money which provides him with bread, and that he sets at naught the simplest principles of right and duty when he interferes with others who are willing to accept that very money for their labor.

A manly, open protest by those who deem themselves oppressed we can not but admire; but conduct of the dog-in-the-manger sort is only deserving of reprobation. If we stop for a few moments to consider the amount of evil wrought in this last hostile movement of labor, through the stoppage of transportation and the supplies necessary for mines, factories, mercantile houses, and the general population, to say nothing of the tremendous waste of property and the terrible destruction of human life which it has indirectly occasioned, we can not repress a thrill of indignation, that intelligent men should precipitate so rash a measure, particularly when the dire consequences of their act must come home to them eventually.

Let the workingmen who are unjustly treated, counsel together for relief; let them present a clear statement of their grievances to the proper persons, then to the public, whose sentiment and sympathy are usually, if not always, with them, and in most cases such a course would bring about an adjustment of the matter of complaint. Scarcely a railroad or manufacturing corporation exists which would not consider the deliberate and earnest remonstrance of its faithful employés against any condition or measure which the latter have, by general consent, declared unfair or oppressive.

ONE MAN SATISFIED.

ONE bright and beautiful morning in July last, we met with a strange phenomenon—a man who says he is thoroughly satisfied with life in all its phases. And to emphasize this opinion of his, he enthusiastically declares that if he could enter the spirit world as if he never had been born, yet knew precisely what he knows now of earth, having lived upon it fifty-seven years, and were consulted by the Creator on the subject, and if it were proposed to him to be born into life on earth to live sixty years, and the question were left to his choice in all respects, he would say, "I will be born in the nineteenth century, in 1820." If questioned as to what part of the world he would be born in, he would say, "In the United States of America." If asked in what part of the United States, he would instantly reply, "Connecticut." If asked what part of the State, his reply would be, "In New London County."

"No other time since the world began has there been such a time in which to be born and live as the nineteenth century. The civilization of past ages has been working out results to make possible the steamboat, the magnetic telegraph, photography, the power loom, the sewing-machine, shorthand writing, railroads, the lightning printing press, and all the wonderful achievements which have culminated in the United States since this century began. I would not have come into life earlier than I did, because the highest and best conditions of

the country had not been attained. Our fathers had subdued the wilderness of the continent, and made it to be a desirable abode for men; they had established a free government with few blemishes; they had fought the battle against the despotisms of the old world and won the victory; they had achieved for themselves and their children an inheritance which made the civilization and the liberty of the day possible; and during this present century and in this precious country, under these blessed auspices, men have the highest and best opportunities for individual development and culture, for the enjoyment of the largest freedom for the largest number, and the general morality which makes life desirable.

"Whoever is living a hundred years hence will find this country so greatly changed that one might almost as well live in China. The rich will have become richer and the poor poorer; population will have increased so as to make the country crowded. I am entirely satisfied with my life. I have had one aim in it, namely, always to do the best I possibly could; to aim at the right under all circumstances; and, though I occasionally miss it, my aim is honest and my conscience approves my efforts. I hope there is a life to come; I expect it; and if the future life is half as good as this life has been to me, I shall be satisfied. I am satisfied with this; I hope to be satisfied with the future. I would not change, if I had my life to live over again, one phase of it. I might use more wisely some of my opportunities, but the surroundings which I have had have been the best, and I would be willing to go over it, and I would not ask to have any phase of it altered to accommodate me. If my experience would enable me to make better use of my opportunities than I have done in the past, that would enhance my happiness so much the more. Here I am, thanking God for what I have had the opportunity for knowing, and doing, and being; rejoicing in the good which life has yielded to me, and, as I have said, I shall be satisfied if the world to come is half as good as this."

BENEFACTORS AND BENEFACTIONS.

ANY contribution made by wealth for the promotion of an institution which has for its object the improvement of society is deserving of approval, but the measure of our approval is, or should be, graduated by the appropriateness of the contribution. Everything in human conduct has its rational side, says the philosopher, yet in the department of human conduct which relates to benevolence, it seems that society by common consent has waived its right to criticisim, and however irrational may be the bestowment of a gift, praises are accorded the giver on all sides. To be sure, the pæan of adulation is proportioned to the size of the contribution.

Prof. Huxley remarked to an English audience, shortly after his visit to America, that the American people were a nation of benefactors, so many gifts and contributions toward educational and charitable objects had been brought to his notice during his short stay in the United States. The learned physiologist hadn't time, of course, to consider the merits of these several expressions of liberality on the part of wealth; he could only be informed that such a man had endowed this or that college with a certain sum of money, that another had founded this hospital, that another had given of his millions to erect that grand church edifice, etc. Had he inquired carefully with regard to these "monuments," he would probably have found that some of them were quite unnecessary, some unsuitably organized, and some altogether inadequate in their equip-

ment for the practical realization of the object entertained by their founder. Had he taken the time to survey thoroughly the field of American beneficence, he would have found that many of the gifts of wealth proceed from motives largely colored by selfishness, and insufficiently enlightened with respect to the real wants of the community; that some men are chiefly desirous to perpetuate their names, and think that in founding a seat of learning or a church edifice, they will reap an eternal meed of gratitude. Such as these do not consider the wants of institutions already well established, and performing an excellent work, and in most cases they but cause to be started an undertaking which early shows weakness because the money contributed for it has scarcely been more than sufficient to erect the buildings.

We could name several creations of this sort whose beginnings were trumpeted throughout the country, but which are now scarcely alive, and the large expenditure of money and labor on their behalf practically wasted. The Pennikese Island Scientific School, for instance.

If the men and women of wealth who have in the mind the application of some part of their surplus money to an object which, according to their desire, shall be a means of social benefit, would carefully inquire into the wants of the community, they would not, if they make their donations in life, as should be generally the case, be mortified by the spectacle of the waste of their money. Such inquiry would reveal to them the utility of old institutions and their needs. We could name a dozen admirable establishments, educational and eleemosynary, whose several work would be most profitably quickened by an endowment of a quarter of the sum necessary to erect the buildings of a new institution. One's commonsense needs no pricking up to appreciate the propriety of coming to the relief of an old and tried college in a time of embarrassment. At this hour there are several institutions of learning which, like the University of New York, are crippled by the great depression in what, but a short while ago, were deemed the best railway and banking securities, and the suspension of any one of these institutions would be a serious loss to American society.

So, too, there are a dozen missionary and reformatory societies which need the substantial encouragement of money aid for the earnest and thorough promotion of their different enterprises. No past time in our history has witnessed so much activity and effort for the help and education of the masses as are now in exercise notwithstanding the 'hard times.' The Phrenological Institute has been kept in motion for years, affording instruction in the most valuable of human interests altogether by the enterprise and coöperation of a few self-sacrificing persons. Had its trustees the means to adapt its usefulness to the needs of the public, this Institute would at once take an important position among the educational and reformatory movements of the land, and command the respect of all classes. The moneyed class is generous beyond precedent, and it only needs enlightenment with regard to the best methods of exercising its generosity to realize its expectations in the accomplishment of good, and in gratifying its desire for praise by the community and gratitude from the beneficiaries.

NOW FOR OCTOBER. — At the present writing (the last of July) the Summer Session of the Institute is in progress, and though the attendance is not very large, yet the students have intelligence, earnest-

ness, and that talent which means success. Our Autumn Session will be opened on the 6th day of October, and will continue six weeks. All who have a desire for information, whether they contemplate being students in the Course or not, can obtain a circular explaining the work of the Institute, and all the particulars that relate to the courses of instruction. We hope to have a large student-list in the fall; and since many kinds of business are suffering from the dullness of the times, those who have a little money in hand and six weeks of time, may avail themselves of the opportunity to learn a profession by which they may attain success and reputation, or qualify themselves more fully for any business which they may have chosen. For circulars please address S. R. WELLS & Co., 737 Broadway, New York.

Our Mentorial Bureau.

[In this Department will be noticed such matters as are of interest to correspondents and to the general reader. Contributions for "What They Say" should be brief, pointed, and creamy, to secure publication.]

To Our Correspondents.

QUESTIONS OF "GENERAL INTEREST" ONLY *will be answered in this department. But one question at a time, and that clearly stated, must be propounded, if a correspondent shall expect us to give him the benefit of an early consideration.*

IF AN INQUIRY FAIL TO RECEIVE ATTENTION *within two months, the correspondent should repeat it; if not then published, the inquirer may conclude that an answer is withheld, for good reasons, by the editor.*

WE CANNOT UNDERTAKE TO RETURN UNAVAILABLE *contributions unless the necessary postage is provided by the writers. In all cases, persons who communicate with us through the post-office should, if they expect a reply, inclose the return postage—stamps being preferred. Anonymous letters will not be considered.*

PHRENOLOGY AND EVOLUTION.—E. B. W.—There may be little or no conflict between the principles of Phrenology and of Evolution, as you say, but it is certain that the writers on Phrenology have not sought to furnish data in support of the latter. They have aimed to present the doctrine of Phrenology clearly and fairly, so far as their investigations have extended. Phrenology recognizes the orderly development of the nervous system in animal life, which presents an analogy to the doctrines set forth by the evolutionists. We, however, do not entertain the opinion that Phrenology confirms Evolution, the latter being, with all its fascinating probabilities, an undemonstrated theory as yet.

GOITRE AND DIET. — The abnormal growth known as goitre indicates an unhealthy condition of the blood, induced, in most cases, by some irregularity or impropriety in the diet. Dr. Good states that the prevalence of this disorder among the Swiss and Alpine people was "ascribed by some to the use of snow water; by others to the use of water impregnated with calcareous earth; both of which opinions are entirely without foundation." A more plausible theory is that it is induced by dampness in the atmosphere, and the foul and wretched habits of the people. In some cases it is due to transmitted or constitutional taint. We would advise you to render your diet as pure as possible. In other words, free from stimulating or irritating influences. In the treatment of goitre manipulations with water are of service, and the compress might be kept on nearly all the time, with cold changes, if there be heat in the tumor. Your tendency to hungry mania is due to former habits of eating, we think. Old practices can not be thoroughly eradicated in a short space of time; they will, every now and then, assert their presence, to the mortification of the person.

PERSISTENT CHILD.—Educate the boy in the line of his gifts. Of course give him the opportunities necessary for a good English training. Reason with him; show him the necessity of education to enable him to carry out his hopes and wishes. Assist him with advice and direction in the line of his peculiar bent. Gentleness and sympathy will usually win upon a child of that character, and secure his coöperation.

HAIR TURNING GRAY.—X. Y. Z.—Two or three causes might be assigned for this disagreeable appearance, among which constitutional influences and ill-health are the chief. If the

system be well nourished, the hair has a good chance for normal growth. If the body be weak and unduly sustained the hair sympathizes, and may become thin or gray. Dissipation is one of the prominent causes of the premature graying of hair. People who do not take rest enough; who eat stimulating, exciting food, and drink improper beverages, or go to exciting social amusements, waste their energies and lose physical vigor.

A LIGHT MERINO GARMENT is serviceable for summer use next the skin. Linen is also refreshing in very warm weather, but for general wear in the summer we would advise thin merino.

SORE EYES.—Be careful with regard to your diet; avoid sugar, butter, and other highly carbonized articles. Eat plenty of fruit, so as to purify the system. Use a cold water bandage on the eyes—not pressed upon them closely, so as to give annoyance. It would be well for you to submit the case to some good ophthalmic physician. A trouble of this kind should not be treated lightly.

OIL STOVES.—Oil stoves are exceedingly convenient for the use of a family of moderate size; in fact, for the use of any family whose management of the kitchen is economical. To avoid any disagreeable consequences in the way of escaped gas or the products of combustion, it would be well to place such a stove while in use in the chimney opening. We have used oil stoves with no disagreeable effects in that way. If one has not a grate or chimney opening (nowadays too many houses are built improperly, their chimneys being small and furnishing to rooms only a small opening for a stove-pipe), a small pipe can be used to collect the smoke and gas and discharge it through the chimney flue. The oil stove should not be used in the center of a room for cooking or heating purposes.

HUMAN PROGRESS. — *Ques.* Are all races susceptible of the same development?—G. A. *Ans.* No, for the reason that they differ in organization. Development necessarily depends upon organization.

THE ENDLESS SQUIRREL QUESTION.—A correspondent takes us to task for our late answer to the old question of the squirrel and the tree, and says: "The man can not pass around the squirrel as long as they keep on opposite sides of the tree; and if the sun were to move with the earth so that it would always shine on one side of it, I hardly think you would claim that the earth passed around the sun."

Ans. It is precisely what we do claim. Suppose the sun to travel in an orbit say 1,000,000 miles in diameter, and the earth to make its circuit around the orbit of the sun in an orbit of its own 100,000,000 miles in diameter, it would make no difference in what part of his orbit the sun might be, whether it traveled around its orbit in just the same time that the earth required to make the circuit of its orbit, and the sun kept one side turned all the time toward the earth; the earth would have passed quite around every part and parcel of the sun and the orbit in which it moved just as really as if the sun had been in the center of the earth's orbit and also of its own, and had not revolved on its axis at all.

Place a house in the center of a hundred-acre lot and make a road around the lot and drive a horse around the farm, house and all, and it will make no difference whether the owner stand still in the center of his house and keep his face toward the team turning on his center as the team travels, or whether he walks around the outside of the house either on the side next the team or on the opposite side of the house. The road incloses the hundred acres; the house, man, or squirrel occupy the center of the plat, and the team travels around everything within the hundred acres whether it be stationary or moving, and it does not matter in what direction it may move.

What They Say.

"RESPONSIBILITY IN PARENTAGE."—The Science Tract which contains the discourse by the Rev. S. H. Platt, on this topic we have read with much interest, and we deem it so worthy of consideration that we can not refrain from offering a few remarks on the subject. Mr. Platt has struck the right chord and should strike again and again, for we think the responsibilities attending parentage are of such grave import, that not only parents should be called upon to reflect upon their course of action, but those who have not as yet assumed the responsibilities of married life should be made to pause and ask themselves if they are fully prepared, and feel the weight of the responsibilities accompanying the marriage vow.

The argument of Mr. Platt is sound and truthful, and it would be well for fallen and suffering humanity to heed the timely and Christian warning, and profit thereby. We have only to look around us and bring into requisition the reasoning faculties, as we listen to the voice of nature, to be convinced of all the truths that are set forth in that tract. Man, as the noblest of the works of creation, was made to glorify the God who created him, not only in word, but in act and deed, and as he has been endowed with reasoning powers, it is his duty to strive to improve, not only the mental, but also the moral

and physical powers as well, and thus to rise higher and higher in the scale of existence. I hold that each individual is held responsible for the manner in which he uses his faculties, and happy will he be who, knowing his duty, has fully come up to the work. Can any one plead ignorance in this age of the world, ignorance of paternal duty, of the laws of health, etc., when the means of acquiring knowledge are so cheap? Surely not. We argue that parents are not only responsible for the moral and spiritual training of their children, but for the physical as well. Is not the health of children of as much importance, and should it not receive as much attention as their education? Nay, more, for the one has direct influence over the other, and a child's progress and its success in life hang upon the degree of health it enjoys. It is by living in violation of the laws of health that brings upon the human family the sufferings endured; thus are they, to a great extent, self-created, brought about by carelessness as well as transmitted to children that rise up to establish their parents' shame. There is a responsibility in parentage, broader and deeper than the ocean, the great emblem of eternity, and it reaches as high as heaven's dome. We hold there is no sin of deeper dye than that of bringing into the world creatures whose lives are careers of misery and suffering to themselves, as well as a hinderance to others. The car of civilization is impeded in its progress, and groans beneath its load of maimed and halt, and lame, and blind, its lunatics, paupers, and criminals. Asylums, jails, infirmaries, etc., must be built to accommodate these, entailing vast expenditures of time and money. Now, why is all this? What is it but sin? It is true that the sentence of death can not be revoked, but there is much sin, suffering, and expense that may be reduced if the people of this nation would but turn their earnest attention to social reform. We think if parents did their duty toward their children there would be fewer suicides in the world. How many a poor girl is turned out upon this cold world with no means of support save by drudgery; uneducated, she goes forth, or is thrust forth from the parental roof, with little to look forward to, and little to hope for, and to escape their hard lot, many find rest in a suicide's grave. Who is responsible? We think that they who gave her being are, for did not they, in taking the marriage vow, acknowledge their ability to meet all of its responsibilities? Show me a healthy family, and I will show you one that is orderly, well-regulated, and happy, and one whose record will never be stained by crime, and the mother of such a family, you may rest assured, is careful about the food she sets before her children; she has their welfare at heart, feels her responsibility, and well for them it is that she does; and her care is rewarded by raising up cheerful, happy, and useful men and women, who are blessings and ornaments to society.

A. J. MURPHY.

CULTIVATING COMBATIVENESS. — A Philadelphia correspondent speaks of his experience in attempting to apply what he deemed in accordance with phrenological principles to his own nature. He says: "A few years ago I looked upon Phrenology as a sort of fanaticism, but now I regard it as the only system through which the highest intellectual development can be obtained. I feel like uttering George Combe's exclamation, 'Were I this moment offered the wealth of India, on condition of phrenology being blotted out from my mind forever, I would scorn the gift.' About a year ago I had a phrenological examination, and discovered that my weakness was owing mainly to want of development in the organs of Combativeness and Self-esteem, while Cautiousness was excessive. I was very timid, lacked determination, could not defend my own rights, and felt as if I were a stumbling-block in the world. I had, however, a good degree of Firmness, and so I struck out boldly, and endeavored to cultivate my weak organs, and think that I have succeeded very satisfactorily." He adopted a novel method of cultivating Combativeness, as will be seen by the following quotation from his letter: "I studied the phrenological definition of Combativeness, and found that it advised one to face danger rather than shrink from it. I looked around to see whom I should strike first, and not being a pugilist, I did not think it well to operate in that direction. I noticed, however, that in my walking to and from school, I was inclined to turn out for every person I met. Then I called my reasoning organs into play, and they told me that I had as much right on the public thoroughfare as others, and should not turn out any more for them than they for me. So having made up my mind one morning to pursue a direct course, I walked to school, determined not to turn out for anybody. I walked on in a direct line, looking neither to the right nor to the left, but had not walked more than half a square when I came into collision with a man who was walking very rapidly. The result was, I lost my balance. Recovering myself I looked around, but the man disappeared, and I was master of the situation. I again started on my course, but now my Cautiousness being awakened, led me to proceed with some care. From that time I practiced this sort of walking, and people seemed to become familiar with my way or disposition, and turned out pretty freely. I think that my organs of Combativeness and Self-esteem have been developed considerably. I do not altogether advise other people to follow my lead in this matter,

but it really seems to me that my force of character has been much brought out by it." W. S.

PHONOGRAPHY AS AN AID TO IMPROVEMENT.—One of the chief aims of mankind in this enlightened age is, or should be, self-improvement. All the faculties of the mind, as well as the different parts of the physical structure, can be improved and strengthened by judicious training and exercise. We may not derive much benefit from our labors in this direction in a month, or in six months, or perhaps not even in a year, but the process, though slow, is none the less sure.

Our minds will become strengthened by every hour of study, and by and by we shall find that we are fast gaining ascendency over our weaknesses.

Among the different studies necessary in strengthening the faculties of the brain, the study and practice of the art of Phonography stands pre-eminent. Not only does it strengthen the general understanding, filling the mind, if the practice be general, with a variety of useful knowledge, but it has its influence on separate and distinct faculties of the mind. The organ of Form for instance, is strengthened by continual exercise in the endeavor to remember the configuration of the phonographic characters, and the efforts to read them.

The organ of Language is perhaps more affected by this study than by any other. The burning words of eloquence as they fall from the speaker's lips, are mirrored, as it were, on the mind of the reporter as he follows with his brain and hand the words of the orator. Not only may the phonographer in time become a ready talker, but fluent, using the best words and expressions to convey his ideas. He also becomes acquainted with the correct pronunciation of words.

This useful study is also a great aid in cultivating many other faculties, as Eventuality, Imitation, Ideality, Continuity, and others. Indeed, one might write all day concerning the benefits to be derived from a study of this useful art, not only as an aid to self-improvement, but also in the promotion of the happiness of others, in extending the arts and sciences, and in a great saving of time and disseminating general knowledge. W. H. H.

DISCOVERING OLD HYGIENIC TRUTHS.—I have been very much amused by reading a number of articles in relation to water-treatment of fevers, or similar matters, which have, within a short time, appeared in various newspapers and magazines, some of them original productions, and some of them old, but all favorable to the water-cure system, and all treating the subject as if the great natural principles at which they are so much astonished, had been lately discovered. One of these articles was a copy of a letter written by a man in one of the Southern States, explaining his mode of treatment of fevers, and which was published many years ago in the "Hydropathic Encyclopedia," one of the best books published by your house. Another was the article entitled "The Eve of a New Departure," which was copied, in part, from the Cincinnati *Medical News* by the PHRENOLOGICAL JOURNAL, with an appropriate introduction.

The production of such old and established truths, as facts, not before known to the writers, at this late day, is irresistibly suggestive of Rip Van Winkle. But this general waking-up is better late than never, and if it is beginning to occur now, far be it from my purpose to attempt to discourage it. It is the usual fate of reformers, who advance any great and startling truth, to be considered lunatics by the world, and after they die, or are about ready to die, and the increasing intelligence of the people has enabled them to see sound sense in the teachings, which when first promulgated were regarded with distrust and ridicule, then some other person steps in and "discovers" the same wonderful fact, and makes a great flourish. But this is an excellent verification of the saying, "Truth is mighty and will prevail." F. G.

WISDOM.

"Think truly, and thy thought
Shall be a fruitful seed."

HE who multiplieth words will likely come to sin.

THE atmosphere of meekness mellows the unripe fruit of human pride and haughtiness.

ADMIT no guest into your soul that the faithful watch-dog in your bosom barks at.

SACRIFICE thy will for others, that they may be disposed to sacrifice their wills for thee.—*Talmud.*

GO not to your doctor for every ail, nor to your lawyer for every quarrel, nor to your pitcher for every thirst.—*Spanish Proverb.*

THIS span of life was lent for lofty duties, not for selfishness; not to be whiled away for aimless dreams, but to improve ourselves, and serve mankind.

THOUGHTFULNESS for the comfort of those about us, a pleasant smile, a kind word—these are the ingredients of which good manners are chiefly composed.

SOME men are like pyramids—very broad where they touch the ground, but grow narrower as they reach the sky. Observe their heads; they are correspondingly pyramidal.

ALL brave men love; for he only is brave who has affections to fight for, whether in the daily battle of life or in physical contests.—HAWTHORNE.

THEY are poor that have lost nothing; they are poorer far who, losing, have forgotten; they most poor of all, who lose and wish they *might* forget.—JEAN INGELOW.

MANY a man thinks it's virtue that keeps him from turning rascal, when it is only a full stomach. One should be grateful, and not mistake potatoes for principles.

TIME and pains will do anything. This world is given as the prize for the men in earnest, and that which is true of this world is truer still of the world to come.—F. W. ROBERTSON.

PATIENCE is always crowned with success. This rule is without an exception. It may not be a splendid success, but patience never takes anything in hand that it does not succeed with at least in some form.

How many troubles might mankind be spared if they would stop to hear each other's explanations! How many ailments, both of body and soul, would be cured if explanations only came more frequently and freely!

IT requires some talent and some generosity to find out talent and generosity in others, though nothing but self-conceit and malice are needed to discover or to imagine faults. It is much easier for an ill-natured man than for a good-natured man to be smart and witty.—REV. DR. SHARPE.

MIRTH.

"A little nonsense now and then,
Is relished by the wisest men."

THE LATEST.—Blue glass worn in the crown of the hat is said to develop brains in the head beneath.

IT was the shrewd remark of an old Florentine that economy does not consist only in saving and sparing, but also in using everything when there is need for it.

ONE of the Southern papers tells of a man whose life was saved by a plug of tobacco carried in his pocket. A pistol-bullet fired at him lodged in the tobacco, and the man was unharmed. Moral: If you *must* use tobacco, don't take it out of your pocket.

"WHY, Eliza Mary, I aint seen yer for I don't know 'ow long!" "No, Mrs. Jenkins, you aint. I've been that ill I don't seem able to get well at all!" "But 'aven't you taken any remedy?" "No, indeed, Mrs. Jenkins, but I've taken a power of physic."

OLD Dr. Sam Johnson knew what he was talking about when, in his dictionary, he put this definition: "Network—anything reticulated or decussated at equal distances, with interstices between the intersections."

A NEW YORK professional man returning to his office one day, after a substantial lunch, said to his assistant, "Mr. Peetkin, the world looks different to a man when he has three inches of rum in him." "Yes," replied the junior, without a moment's hesitation, "and he looks different to the world."

MAKE sense of this: "Lord Palmerston then entered upon his head, a white hat upon his feet, large and well-polished boots upon his brow, a dark cloud in his hand, his faithful walking-stick in his eye, a menacing glare saying nothing."

"Is there an opening here for an intellectual writer?" said a very red-faced youth with the cork of a bottle sticking out of his breast pocket. The editor, with much dignity, took the young man's intellect in and said: "An opening? yes, sir; a kind and considerate carpenter, foreseeing your visit, left an opening for you. Turn the knob to the right."

"YOU jist ought to have been over to our house last night!" shouted one small boy to another on the Campus Martius, yesterday. "Why—making pictures?" inquired the other. "Naut much! Hump! No, sir; our folks went away, and we had pop corn, two kinds of sweetened water, milk and camphor, drew the dog around in the table cloth, and the hired girl told us eight ghost stories."

FOREWARNED.—"Who in the mischief has ordered such boots as that?" casually asked a young man of his shoemaker, pointing to a colossal pair of No. 9 mud-smashers, with inch-soles, and toes rounded off like the bow of the Brooklyn ferry-boat. "Them? Oh, them 's for Mr. ——; he said as he expected to do some heavy kickin' in a day or two, he had 'em made a purpose." The young man turned pale as he recognized the name of his dulcina's father, who had peremptorily ordered him off the front stoop a few nights before.

AN elderly gentleman, accustomed to indulge, entered the room of a certain inn, where sat a grave friend by the fire. Lifting a pair of green spectacles upon his forehead, rubbing his inflamed eyes, and calling for hot brandy and water, he complained that "his eyes were getting weaker and weaker, and that even spectacles didn't seem to do them any good." "I'll tell thee, friend," replied the Quaker, "what I think. If thee was to wear thy spectacles over *thy mouth* for a few months, thy *eyes* would get round again."

Library.

In this department we give short reviews of such NEW BOOKS *as publishers see fit to send us. In these reviews we seek to treat author and publisher satisfactorily and justly, and also to furnish our readers with such information as shall enable them to form an opinion of the desirability of any particular volume for personal use. It is our wish to notice the better class of books issuing from the press, and we invite publishers to favor us with their recent publications, especially those related in any way to mental or physiological science.*

A MANUAL OF THE ANTIQUITY OF MAN. By J. P. Maclean, A.B. 12mo, cloth, pp. 159. Price $1.00.

As the title indicates, this volume is an attempt to present in synoptical form the evidences geological, archæological, historical, and physiological, bearing on man's existence upon the earth. He adopts the view of a prehistoric rudimentary condition from which man slowly emerged by a process of intellectual and moral development, which view his array of data appears to warrant, although some of them, like the fossil crania of Meanderthal and Mentone, admit of variant opinions. The book is neatly illustrated with portraits of scientists, and views of interesting human relics which investigation has brought to light.

FRUIT AND BREAD. A Scientific Diet. By Gustave Schlickeysen. Translated from the German, by M. L. Holbrook, M D., author of "Eating for Strength," etc., with an Appendix. Illustrated. 12mo, pp. 227. Price $1.25. New York: M. L. Holbrook & Company.

Since the publicatian of Sylvester Graham's powerful treatise on vegetable food, nothing has appeared which can be said to exceed it as an argument against the use of flesh meat. Although many volumes have been produced by hygienists, and some of them are quite admirable as popular expositions of dietetic fact and philosophy, yet they do little more than repeat the teaching which is to be found in "The Science of Human Life."

The hygienic movement, in its progress toward eschewing the flesh of animals as food, has shown no little activity in Germany of late years, and several writers of importance have given their pens to its maintenance. Among these may be mentioned Baltzer, of Nordhausen, Theodore Hahn, and the author of the volume above entitled. Dr. Holbrook has shown a good discretion in selecting this as a fit subject for translation; and while it furnishes in a clear and attractive form a good quantity of desirable information relating to evidence in favor of the farinaceæ and other vegetables as man's proper food, it also gives the reader some clew to the state of dietetic reform among the German people.

The author pursues an orderly course in the discussion of this topic. First, he reviews the "anthropological argument," or zoological side of the question; next he considers the physiological side; next and last the dietetic. In the course of the last subdivision, he says, very truthfully: "The modern kitchen has thus perverted the natural appetite and enfeebled the natural powers. . . . . Only through its aid can the flesh of animals be rendered palatable." Some excellent suggestions are supplied with reference to the care and preparation of vegetable substances—grains, fruits, etc., and a *resumé* of the authorities quoted is appended.

PUBLICATIONS RECEIVED.

BROWNE'S PHONOGRAPHIC MONTHLY for July exhibits enterprise and progress.

DOCUMENTARY FORM for Recording Cases of Disease which endanger the Public Health. Issued by the Michigan State Board of Health.

REPLY TO DR. J. MARION SIMS' PAMPHLET, entitled "The Woman's Hospital in 1874," by his former colleagues, Drs. E. R. Peaslee, T. A. Emmet, and T. G. Thomas.

IDLE HOURS. Vol. I., No. 1. M. T. Richardson, Publisher. Price 10 cts. This is a new venture by our enterprising friend, in which a deal of story and sketch reading is furnished for the price.

LIVING WITNESSES; or, Voices from the Inebriate's Home at Fort Hamilton, N. Y. Let the poor victim of drunkenness be placed in relations where he will be saved from himself under the guidance of skilled and kind physicians.

TOUCH ME GENTLY, FATHER TIME. Price 40 cents. TALLY ONE FOR ME. Base-ball song and chorus. Price 40 cts.

The above are two of the freshest compositions for the use of the vocalist, issued by F. W. Helmick, Cincinnati, O.

THE CONGREGATIONAL QUARTERLY. July, 1877. Contains a fine steel portrait of Selah Burr Treat, with a Biographical Sketch; Ritschе's Critical History of the Doctrine of Justification; Harriet Martineau's Autobiography and Memorials; and other topics.

"CEASE THY WEEPING, SADDENED HEART." A Ballad by M. C. Vandercook; is a composition which will sustain a favorable comparison with the song music of the day. A pretty melody with an easy accompaniment. Price 30 cts.; supplied by the author, whose post-office is Allegan, Mich.

THE COMPLETE PREACHER. Sermons in full, by some of the most prominent clergymen in this and other countries. The number under present consideration contains five sermons by eminent preachers. Rev. I. K. Funk, of New York, is editor. Price, per No., 25 cts.

NOW READY.

THE

Uniform Edition of

[GEORGE COMBE.]

COMBE'S WORKS.

A New Edition of the Works of GEORGE COMBE, *on fine tinted paper, from carefully revised plates, bound uniformly in extra muslin.*

A System of Phrenology.— With upwards of one hundred engravings. $1.50

This work is broad in scope, and profound in treatment, showing clearly the great superiority of Phrenology over other systems of Mental Philosophy. It is recognized generally as the most dignified and exhaustive work on the subject in any language.

Lectures on Phrenology. — With Notes and Illustrations. An Essay on the Phrenological Mode of Investigation, and Historical Sketch. Reported by Andrew Boardman, M.D. $1.50.

Constitution of Man. — Considered in relation to External Objects. The only authorized American Edition. Twenty engravings, and a Portrait of the Author. $1.50.

A work with which every teacher and every pupil should be acquainted. It contains a perfect mine of sound wisdom and enlightened philosophy, and a faithful study of its invaluable lessons would save many a promising youth from a premature grave.—*Jour. of Ed.*

Moral Philosophy: Or, the Duties of Man considered in his Individual, Domestic, and Social Capacities. With the author's latest corrections. $1.50.

This Edition is Sold only in Sets. Price $5.

This Set comprises the four of best works treating on the subject of Phrenology, and it should be found in the library of every Lawyer, Clergyman, Teacher, Student, and Family. For sale by Booksellers, or sent by mail, post-paid, by

S. R. WELLS & CO., Publishers,

737 BROADWAY, NEW YORK.

REDUCTION IN PRICE.

A New Edition

OF THE

FAMILY PHYSICIAN

A ready prescriber and Hygienic adviser, with reference to the Nature, Causes, Prevention, and Hygienic Treatment of Diseases, Accidents and Casualties of every kind. By JOEL SHEW, M.D., author of "Children, their Diseases and Management;" "Diseases of Women," etc. Illustrated with nearly three hundred Engravings. Price, $3.00.

A new edition of this valuable work has been published as a large 12mo, and the price reduced from $4.00 to $3.00, bound in extra muslin. The work has not been abridged, and contains over eight hundred octavo pages, and nearly three hundred pertinent and appropriate illustrations, showing plainly the various subjects treated of, and enabling the unprofessional reader to understand the construction of his physical organization. As will be seen from the table of contents given in the following pages, it covers the whole ground of human existence, from birth to old age, with all the conditions, diseases, and accidents to which the system is subject. The remedies recommended are Hygienic, and directions are given for HOME TREATMENT, which will enable the reader to avoid the necessity of calling a physician in the majority of cases. Besides, the

Laws of Life and Health

are made so plain as to enable one to avoid sickness and infirmities which come from a violation of the conditions of Health. Many testimonials have been received from the press, and those who have been benefited by following its teachings. Below are found a few of these

FAVORABLE NOTICES.

It possesses the most practical utility of any of the author's works, and is well adapted to give the reader an accurate idea of the organization and functions of the human frame.—*New York Tribune.*

The work is admirably simple, clear, and full, and no popular work that we ever saw had half its claims to notice. We hope it may have a wide circulation. Its mission is a most important one. It lies at the foundation of all other missions of reform. Let the world be informed in regard to the laws of health, and every other reform will have its way cleared. Till then, every effort for moral and intellectual improvement can be only partially and feebly effective.—*Boston Ledger.*

Without the fear of our family physician before our eyes, we say that this is a very good book to have in families. It contains much valuable instruction in the art of preserving and restoring health, which every man of common sense, who understands anything about the human frame, will see at once is, and must be, sound and reliable. It might, almost any day, be the means of saving a valuable life. We are honestly of the conviction that every household in the land would lessen its complaints and doctor's bills, if they would read it and follow its suggestions.—*Boston Congregationalist.*

The different cases upon which it treats number over *nine hundred*, in each of which the symptoms, the cause, and the *manner of treatment are given in full.*—*Clinton Tribune*

There is not a subject relating to health but what it treats upon, in an able manner.—*Howard Gazette.*

Its 816 pages abound with thousands of facts and suggestions of the *highest importance to all.*—*Christian Inquirer.*

It is the best work of the kind we have ever seen upon the subject, and ought to *be in every family.*—*Advertiser.*

It is very elaborate, and is one of the very best of medical works. Every family should have a copy.—*Star of the West.*

It is worth its weight in gold.—*Ellsworth Herald.*

It is a very able and excellent work, and one which we can heartily recommend to every family; it is every thing that its name purports to be.—*Scientific American.*

It is a very comprehensive, valuable work, and can not fail to exert a salutary effect upon the public mind.—*Baltimore Sun.*

We have no hesitancy in pronouncing it *a very useful book*, and one which should be in the possession of *every family.*—*Beaver Dam Republican.*

Familiarity with its contents will save many dollars' worth of drugs, and avert many weary days and months of sickness.—*Musical World.*

The work embodies *a vast amount* of information in regard to the structure and diseases of the human frame, which will be read with profit.—*New England Farmer.*

Not only are diseases described, and the appropriate treatment pointed out, but numerous examples are given, which can not fail to interest the reader, and prove a *very acceptable family directory.*—*Boston Traveler.*

It is exceedingly comprehensive, and well illustrated. It contains a great deal of information and sound advice, which every reader, whatever his views on medicine, would consider valuable.—*New York Courier.*

A complete encyclopedia of every disease to which the human family is heir, *with the cure for each disease.*—*Day Book.*

The author has brought together a mass of information in reference to the human structure, its growth and its treatment, which will render his work of great use to readers *of all classes and conditions.*—*Philadelphia Daily Times.*

JUST PUBLISHED.

CHOICE OF PURSUITS;

OR,

WHAT TO DO AND WHY.

Describing seventy-five Trades and Professions, and the talents and temperaments required for each. Also how to Educate, on Phrenological principles, each man for his proper work, together with Portraits and Biographies of many successful thinkers and workers. By NELSON SIZER, author of "How to Teach," etc. 500 pages, extra cloth, price $1.75. S. R. WELLS & CO., Publishers, 737 Broadway, New York.

This book, published originally under the title of "What to Do and Why," is now revised and republished as above, in a handsome volume of more than 500 pages of well-printed matter, with Illustrations. The following, from the Table of Contents, will show something of the nature and scope of the work:

"Choice of Occupation; Cultivation of the Soil; Manufacturing; Trades Requiring Strength; Trades Requiring Activity; Mercantile Pursuits; Professional Avocations: Art, Teaching, Editorship, Reporting, Medicine, Law, Theology, Engineering; Miscellaneous Pursuits; Occupations for Women; How to Obtain a Situation; Food for Thinkers and Workers; How to Educate Each Man for his Proper Work; Faculties of Force, Aspiration, Pride, Prudence, Policy, and Economy; Mechanical Talent and Skill; Moral and Religious Nature; Intellectual Culture; Girls: their Physical Training and Mental Culture; Habit a Law of Mind."

The most important step in life is the selecting of the right pursuit—that pursuit for which one's faculties, temperaments, and education best adapt him. The young man or woman who makes the right selection is guaranteed thereby a happy and successful career: and the man or woman that stumbles into one pursuit after another for which they are not adapted, will give dissatisfaction to all who employ them, and become restless and dispirited, losing hope, courage, aspiration, and ambition, and that sense of independence that lends dignity to the character. What a contrast between one who has selected rightly and one who has not; one is a blessing to himself, his family, and the world; the other, either a machine-like workman, having no interest in what he is doing, or is a load to his friends and a burden on the community. Every one can find living illustrations of these truths. Many people with talents, the exercise of which would place them in the front ranks of some of the higher callings, are living in obscurity, filling some menial place, which they dropped into by chance or accident, ignorant of the talents which God has endowed them with; and many a man that would have made a good farmer is making a poor minister, and *vice versa*. Let every man, woman, and youth read this book and profit by it, and undertake only that which they can do best.

The author was fully qualified for his task, having been engaged wholly and actively as editor and lecturer, and in the practical application of mental science to every-day life for thirty-five years, affording opportunities for making the fullest observations and original investigations on the human mind and its capacity.

The book is handsomely bound in extra muslin, with gilt and ink stamps. Price, by mail, post-paid, $1.75. Agents Wanted. Address

NUMBER 4.] *October, 1877.* [WHOLE No. 466.

REV. JOSEPH COOK.

REV. JOSEPH COOK.

THIS gentleman has a remarkable physical constitution. He is large, weighing something over two hundred pounds, standing about six feet high, and having a head that measures nearly, or quite, twenty-four inches in circumference. He has a strong muscular frame, which sustains him in his labor. His vital temperament is indicated by uncommonly capacious lungs, abundant digestive power, and a free and vigorous circulation. If he were to devote his attention to physical labor, there would not be three in a hundred, as men average, who would be his equal in physical strength and endurance. In conjunction with this gigantic vital and motive power, his great brain and nervous system enable him to do more mental work and live a more intense life—that life being amply sustained by bodily vigor—than one man in many thousands. The impression which he would give a stranger on the street would be, first, of having physical power enough to walk through any crowd, and dominate by mere dynamic force. A second look would impress the beholder with the idea that he possessed intense mental individualism; that he lived in the domain of thought rather than of physical force; that his physical qualities were subordinate to his mental, and that his life was largely interior; and that while he was moving among men and surrounded by them, he was half unconscious of the outer world, like some great factory with all its machinery in rapid revolution, and its windows curtained to the outer world. This apparent abstraction, or preoccupation of thought, indicates in him the student and thinker.

With all his vital and physical strength, and with all his cerebral scope and might, he is still as sensitive as a girl. His skin is thin, and his highly vitalized blood is distributed so freely and abundantly that the color comes and goes on his face as it does on a sensitive youth just merging into manhood. It is not uncommon to find great power coupled with coolness and stately indifference, which enables its possessor to move through a theme without emotion, working out its logical results careless of consequences; but to find such power and breadth of being coupled with such delicate sensitiveness, such intense tenderness of emotion, constitutes the rarity of Mr. Cook's organization. It is this almost inflammable susceptibility which is likely to wear him out or break him down, and we counsel him to be guarded in his efforts, and take abundant rest and recreation. Those who are most interested in the work he is doing should guard against encouraging him to overwork. When his mind becomes interested in a topic he launches every power of his being; and his natural constitution is not one that is conservative, or would spare himself, or guard against excesses of effort. He feels all he thinks, and thinks all he feels, and is terribly in earnest in whatever he regards as true and important, and never does anything in a merely official way.

The reader will observe that the likeness indicates broad shoulders and a deep chest, but they are not fully represented. There is a broad, strong face, with heavy, yet not coarse, features; great length of brain from the opening of the ears forward, showing an immensely intellectual development. The lower part of the forehead being large shows that he takes into account all the facts and particulars; the middle part of the forehead shows that he remembers everything, and its upper portion indicates breadth and comprehensiveness of thought; while the par-

ticular fullness in the center shows analytical and analogical power, which gives him such fertility of illustration of subjects which otherwise would seem dry.

His Benevolence shows a very high development in the front part of the top-head, rendering him generous, sympathetical, liberal, large-hearted. His Veneration is also strong, so is Spirituality and Hope. He has Firmness, Self-esteem, Conscientiousness, and Cautiousness, which give breadth and strength to the head at and forward of the crown. He has a strongly marked social development, which makes him affectionate and companionable; enables him to make friends and draw friends after him, and to be the center of sociality wherever he moves. And lastly, he has wonderful magnetic power. People feel attracted toward him, and are inclined to coöperate with and conform to his thoughts and wishes. Thus, he does not drive people to accept his conclusions, but such an organization induces a willingness on the part of hearers or associates to think, feel, and act in harmony with him. He is not repellant, even toward those who disagree with him, and is therefore calculated to be influential and popular as well as instructive and convincing.

We have known Mr. Cook from the day he started for college; examined his head at that time carefully and predicted his success; and we have watched his career with more than common interest from that day to this.

The reader probably needs no introduction to this gentleman, especially if he be familiar with the current literature of the day, as found in the daily and weekly newspapers. For during the past year the Rev. Joseph Cook's sermons, delivered in Tremont Temple, Boston, have been published far and wide. He was born January 26, 1838, at Ticonderoga, N. Y., of people who make no pretensions to prominence on the score of heritage or social position. He derived from his father, however, certain religious principles, which have colored his course and utterances as a pulpit orator; for the elder Cook may be said to have been in a sense a student of theology, having taken a conspicuous part as a deacon in the small Baptist society of his town. Mr. Cook's mother is of the same belief, and of that upright, conscientious stamp which may be said to represent fairly the Puritan type of religious thought and life.

At nineteen years of age young Cook was graduated from Phillips Academy, and then commenced to teach, utilizing his leisure in study and preparation for college, which he entered the following year. Over-application to books compelled him to withdraw from study in 1861, and take a year of rest. It is deserving of mention, that while he was a student at Yale, the phrenological doctrine of the mind came up for discussion on one occasion, when, taking the part of an advocate, he argued with so much ability and evidence as to win the admiration of the then president of the college.

In 1863 he entered Harvard University, and was graduated in 1865. His course as a student there, as at Yale, being distinguished for superior intellectual excellence. A year later he entered the Theological Seminary at Andover, and remained there four years. He sought for no settlement in the ministry, but gave himself up to the work of an evangelist as opportunity offered. One year he preached in Linn; the next he gave a course of lectures to large audiences in the Music Hall of that place, selecting for his theme the evils of the manufacturing system in the great shoe factories. In 1871 he went to Europe, where he traveled in England, France, and Germany the first year, and then visited Italy, Egypt, and Palestine, returning to America by way of Constantinople, Austria, Switzerland, France, and London. He began to lecture in Boston in 1874. Ere long his extensive acquirements and earnest and powerful logic drew general attention. At first he presided over the noonday prayer-meeting held under the auspices of the Young Men's Christian As-

sociation. His audiences increased so rapidly that the place of meeting was changed to Park Street church, and later, in the fall of 1876, to Tremont Temple.

Giving his attention to those topics which are most conspicuous in that city of liberal theology, Mr. Cook, of course, drew toward himself the opposition and criticism of the leaders of liberal thought. Such opposition and criticism, however, served to develop his strength as a controversialist, and brought him more conspicuously into public notice; his sermons on the Trinity and on the tenets of Parkerism being very extensively published by the religious and secular press. While handling the difficult questions of the day, with regard to morality and religion, his earnestness and impetuosity take possession of the audience. He has a powerful voice, and great muscular endurance. He is a large, heavy man, much above the usual height, with a massive head, a profusion of smooth fair hair, full beard, lacking the mustache, a broad, expansive forehead, a brow strongly ridged, very prominent wide-open blue eyes, complexion fair and fresh, and all the physical constituents of enthusiasm. In social life he is regarded as one of the most interesting companions, being rapid, brilliant, and profound in conversation, ready to talk on nearly all subjects without flagging or dullness. Having traveled so much, he is well supplied with incidents for narrative, and being from the very constitution of his mind a keen observer, he is well furnished with that material which most pleases the average listener. A writer says: "His mind is capable of rapid transitions, and has that quality of suggestiveness which is essentially feminine, rather than masculine, and which he possesses in a singular degree for a man of so distinctively metaphysical turn; thus, though delighting in the most abstruse themes, and in following them out to logical results, his thoughts are swift as a weaver's shuttle, and the illustrations which come so natural and aptly into his conversation remind you of the attractive notes which sometimes brighten the margin of some page whose text is too profound for you to appreciate."

In his discourses Mr. Cook gives liberal rein to his imagination and fancy, thus lighting up what would otherwise be sheer, close argument with effective illustration and striking epigram. From one of his discourses the following is taken:

"The Old Testament Scriptures out of date? Not till the nature of things is. I rode once from a noon on the Dead Sea through a moonlight on the Mar Saba gorges to Bethlehem in the morning light; I passed through the scenes in which many of David's Psalms had their origin, so far as human causes brought them into existence. On horseback I climbed slowly and painfully out of that scorched, ghastly hollow in which the salt lake lies. I found myself, as I ascended, passing a gnarled, smitten, volcanic region, and often at the edge or in the depths of ravines deeper than that eloquent shaft yonder on Bunker Hill is high. At a place where, no doubt, David had often searched for his flocks, I found the famous Convent of Mar Saba clinging to the side of a stupendous ravine; and I lay down there and slept until the same sun arose which David saw. I looked northward from above Mar Saba, and saw Jerusalem above me, yet to the north, for I had been ascending from a spot greatly below the level of the Mediterranean. As I drew near Bethlehem, through brown wheat fields in which a woman called Ruth once gleaned, I opened and read the book which bears her name. Johnson, you remember, once read that book in London, and moved a parlorfull of people to tears by it, who had curiosity enough to ask who was the author of the beautiful pastoral! In my saddle there in Syria I was moved as Johnson's hearers were in London; but when I opened the Psalms, one by one, and looked back over the ravines toward the Dead Sea, and northward toward Jerusalem and upon the hill of Bethlehem, to which all nations, after a gaze of nineteen hundred years in duration, were looking yet, and at that season sending pilgrims; when I remembered how that terraced hill of olive gardens had influenced human history as no other spot on earth had done, and that in God's government of this planet there are no accidents; when I took the astounding harp of Isaiah and turned through the list of the

prophets to find mysterious passage after passage predicting what would come and what has come; and when I thought of those critics under the Western sky who would saw asunder the Old Testament and the New, and put into the shade those Scriptures which Goethe calls a unit in themselves, and which are doubly a unit when united with the New Testament, I remembered him who, on the way to Emmaus, opened the Old Testament Scriptures, and with them made men's hearts burn."

THAT FACE.

I've seen a face to-day
  I have not seen in years;
Strange that so sweet a face
  Should fill mine eyes with tears.

As spirit of one dead
  It beamed upon my sight;
And with it all the past
  Came back in vivid light.

Time had not spared its marks
  Upon that cheek and brow;
But what I saw was not
  What other eyes see now.

A beauty undefined—
  A smile surpassing sweet;
The which to gain I would
  Have fallen at his feet.

Was no good angel near
  To whisper of my need?
To point him where I stood,
  And with his heart to plead?

I could have touched his hand—
  But something at my heart
Told me, although so near,
  We still were worlds apart.

And so, I turned away
  And hushed the old, old pain;
Ah! well I know that face
  I'll never see again.

ANNA CLEAVES.

ASPIRATIONS AND REALIZATIONS.

A LETTER TO WHOM IT MAY CONCERN.

TO MY DEAR FRIEND HOPEFUL:—

When I read your letter last night, with its gush of aspiration, and its glow of enthusiasm, I could not repress a sigh of regret that these were not of themselves sufficient to carry you triumphantly over all the sloughs of despond and the hills of difficulty that lie between you and the fulfillment of you grand, soaring, beautiful ambitions. But, alas! my fond dreamer, too well I know you will find they are like the impulsive, impetuous, tumultuous tides of spring-time that bubble, and sink, and die away in the fierce mid-summer heats, leaving the gaily-glancing sails of Hope, which you had launched upon their treacherous waves, wrecked upon burning rocks, or stranded in sandy deserts. I tell you there must be beneath the froth and foam and noisy rush of impulse, the calm, deep, slow, yet sure-moving undercurrent of purpose that will not be turned once from its aim, although balked a thousand times in its course, or it is vain to set a-sail your fair-weather argosies of Hope with faith that they will ever reach their destined port. I tell you there must be the invincible determination, the unfaltering and inflexible perseverance, the indomitable pluck and intrepid daring that will not yield to repeated disappointments, discouragements, and failures, or you will never pluck the golden fruit which is now but bud and blossom on the beautiful boughs of promise. I tell you there must be the impassionated earnestness, the stern energy, the heroic devotion, the zealous love, that will not be swerved from their mark by any passing wind of fancy or singing tide of pleasure, or you will never grasp with strong, firm, steadfast hand the power which now in fond anticipation you toy with as a child with bubbles that will burst and vanish quickly in thin air.

Do these rude words jar on your dreaming sense like the harsh, discordant croakings of a tired and disappointed speculator

in the prizes of life? Ah, well, if it were so, in God's name take warning, for it is better and infinitely more convincing to preach from the affirmative than the negative side of success.

Of course all this talk sounds to you trite and commonplace; it is well enough, true enough for those who work by ordinary methods, but in your heroic mood you do not expect to plod dully and slowly, but to soar on strong uplifted wing straight to the mark of your high ambition. Of course these admonitions and suggestions seem to you fit enough for those with whom failure is a possibility, but you do not recognize the necessity of laying hold of any such props and stays as might serve and save the weak and stumbling in their uncertain strivings after good. Of course you are ready to acknowledge and celebrate the power of those virtues which have the very ring of victory in their names, but you feel in yourself so strongly the potent elements of success that you scorn to strap on the harness in which less royally confident souls by bit and lash guide and spur themselves to the goal of their aspirations.

God save you, my dear friend! The great ocean of life is littered with the wrecks of just such easy-gliding sails as yours, that floated out trustful and assured of prosperous winds, pleasant voyage, and happy anchorage; but with no strong, resolute, undaunted pilot of purpose at the helm, they dallied and drifted, and dashed at last upon the rocks, or swung lazily, dreamily into becalmed and breathless seas that carried them to no end. And yet, saddest thing of all, these poor dismantled, weather-beaten, aimlessly-drifting, or hopelessly-stranded barques still seem to themselves bound for the shining port of their youthful hopes, and still fondly dream of the golden hour of arrival from which they are as distant as when first they launched upon their idle, wandering voyage.

But you—ah, my brightly confident, securely hopeful mariner on life's high seas, you feel absolutely certain in yourself that you can never be numbered among these, and resent even the insinuation of a possibility so remote from your happy anticipations; yet forgive me for this marring cloud of evil prognostications and unwelcome warning—the danger is more imminent, perhaps, than you realize. You need to mark, as you stand at the wheel which men call Destiny (meaning vaguely, a something turned by invisible powers), you need to mark the action of your hand, whether its habit is lax, wandering, and uncertain, or whether it is firm, tense, true, instant, and unfaltering in the discharge of its office, for by such signs and tokens you may recognize the character—the "invisible power," if you will—which is to shape and determine your course through the trackless seas of time and eternity. As you hold yourself at the helm now, slack or staunch, wavering or resolute, so you will hold yourself forever. The grand, beautiful future to which you are looking with such eager anticipation is but the sum of multiplied to-days. Believe it, there is no better season for the work you have to do than the present hour, which is slipping from your hands like water while you drift with the tide, idly dreaming of pleasures unearned, of triumphs unwon. It is the golden opportunity which you are expecting to arrive, and which is gliding from your grasp, even while you are waiting for the beautiful harbinger of its miraculous dawning. It is the heavenly guide and helper sent to conduct you to the height of your best and purest aspirations; but having no command or leave to tarry, stays not to entreat or warn, but hastens on to eternity with the record of your earnest effort, or of your faithlessness and failure fixed inefficably upon it, and answering letter to letter to the record which the light of judgment shall reveal written in your own soul.

All this talk seems to you the empty repetition of worn-out truths, passing you like the wind which idly flaps your sails, with the impulse of renewed resolution for the morrow. But the morrow, if you mind not, my fond dreamer of dreams, and weaver of promises, will float in and float out as to-day in a panorama of beautiful cloud-pictures, resolving again to the shapeless vapor of unaccomplished purposes. It is so hard to realize that all these brave projects are not leading directly to grand results, that the

intent to do is not in some sort the deed, that the consciousness of power is not in effect potency; it is so difficult to realize these things, my friend, that if you do not have a care, you will find yourself at last on the dreary limits of life with only the dead sheaves of unused opportunities in your hands, and in your soul the awful, unutterable despair that comes with the full sense of irretrievable loss, of irremediable wrong. Could you borrow one agonizing thrill from the torment of that hour, would it not spur you to instant exertion and expansion of the faculties which now, in blissful freedom to will and act, spend themselves in intoxicating dreams of glorious future achievements? For there is nothing so utterly and desolately sad as the slow, sickening realization of a wasted life; and the late desperate effort to rally to the work of redemption the undisciplined powers half paralyzed by long inaction, is even more pitiful because so drearily hopeless.

The penalty which fell irrevocably upon the poor soul that buried his one talent must be met inevitably by all who leave their capabilities for good lying fallow, undeveloped, and unimproved; for power unused, following the unerring law of nature, steadily declines, and slips at last irreclaimably from the hand unfaithful to its charge.

See to it, then, I beseech you, my ardent and enthusiastic builder of cloud-castles, that the fate of such unhappy drivellers does not befall you; and begin to-day, this hour, this moment, to put in execution the heroic plans and purposes of which you dream, lest to-morrow your hand fall more slack, your aim grow more uncertain, and solacing yourself with the siren whisper, "A little delay more or less—what does it matter?" you fail of your mark forever.

ANNIE L. MUZZEY.

SECOND SIGHT IN HISTORY.

SEVERAL years since a newspaper correspondent, giving a subordinate railway officer as his authority, described a phantom train as passing up the New York Central Railroad in April of each year at the period of the anniversary of the death and obsequies of President Lincoln. The time of the phenomenon was about the hour of midnight. Although the night is usually still, the air along the track becomes very keen and cutting. The watchmen on noticing this take their position at a little distance away and wait the coming of the phantom train. Soon afterward the pilot engine arrives in sight, decorated with long, black streamers, and having upon it a band of musicians playing dirges, and skeletons sitting on every side. The air seems to go back, and the music itself to linger as if frozen with horror. The train passes by with flags and streamers hanging from it, the wheels draped and the track covered as with a black carpet. The sarcophagus is seen upon the funeral car; and all about, in the air and on the train behind, appear vast multitudes of blue-coated men, some leaning on their own coffins and others bearing coffins on their backs. The soldiers who died during the war seem to constitute this funeral cortege. While the train is passing, the wind, if blowing, ceases at once; and if the moon has been shining, clouds arise and obscure its light. There is a solemn hush in the air that almost prevents breathing. If another train happens to be going by at this moment, its noise is drowned by the silence, and the phantom train rides over it. Clocks and watches always stop, and when looked at, are found to be from five to eight minutes behind. Everywhere on the road, about the 27th of April, the time of watches and trains is perceived to be thus retarded.

The assassination of President Lincoln in 1865, it will be remembered, created a prodigious sensation over the country. The Confederate armies had just surrendered, and he was devising measures of general pacification when the crime was perpetrated. It was an event without a parallel or precedent in American history. The most elaborate demonstrations took place. A delegation of members of Congress attended the body from Washington to the city of Springfield in Illinois. Legislatures suspend-

ed their sessions. Every city along the route appointed a delegation to meet the sarcophagus and act as a guard of honor. At every place where it rested the people came from all the vicinity by tens of thousands to pay their tribute of respect. The members of the sad embassy were everywhere received as men discharging the highest public trust. The railroad companies provided special trains for the journey. Finally, at Springfield, where Abraham Lincoln four years before had bidden a plaintive farewell to his old neighbors, having a sad premonition of what would befall him, those neighbors now again assembled and received his corpse. The nation till this moment seemed to hold breath; the last offices were performed, and immediately afterward the noise of political movements at the national capital struck on every ear like the sound of clods on a coffin.

The story of the phantom funeral may be an invention; we have heard of no other verification. There have been tales related of analogous spectacles on battle-fields in West Virginia. An impression so profound and general, and so long in subsiding, like that created by the murder of the martyr-President, would be very apt to affect peculiarly, and even abnormally, minds susceptible to preternatural influences.

If there is a world of phantasms, as there is an every-day world, there exists good reason for supposing that the events of our civil war, with the terrible tragedy at its close, would impress themselves there as upon the plate in the camera of the artist, and so be reproduced subsequently in spectral delineations. These might be fair copies of the original scenes, or blended more or less with other occurrences. Perhaps the phenomena are explained by the hypothesis of Gaffarillus, who lived in the earlier part of the seventeenth century, that organic substances, after having been reduced to ashes, still possess the tendency to take again their living form. Spectral apparitions over graves would thus be explained, as well as the array of armies on ground where battles had been fought. In their recurrence at anniversaries or stated periods there is something grotesquely theatrical, which seems to require an explanation. Science, however, is thus far at fault; and scientists, ostrich-like, too generally evade the matter by deriding such accounts as creations of the imagination.

Similar phenomena, however, have been witnessed in other countries and at other periods. Sometimes they preceded the events which they were supposed to represent; at other times they appeared subsequently, but very often they had no apparent connection with any known transaction. Pausanias writes that four hundred years after the battle of Marathon, there were still heard at the place where it was fought the neighing of horses and the shouts of shadowy soldiers. In the Bible we have the story of the prophet Ezekiel in the valley full of bones. He spoke to them, and "there was a noise, and a shaking," and the bones came together in place, were covered with muscles and skin, and finally the new created bodies were resuscitated with air, becoming "an exceeding great army."

Scotland abounds with tales of spectral appearances, armies marching, performing evolutions, and having hostile encounters. In 1750, a few years after the rebellion by Charles Edward Stuart, a farmer and his son, in the neighborhood of Inverness, beheld a large body of troops clothed in red, and accompanied by women and children, carrying utensils for camp use. In 1686, in the months of June and July, there were seen for several days together, near Lanark, companies of men in arms, marching in order by the banks of the Clyde, and other companies meeting them. Many spectators witnessed this exhibition. One person, however, not seeing it began to ridicule, when suddenly, to his great dismay, it also appeared to him.

In the year 1812 two men were at work at Havarah Park, near Ripley in England, and beheld a company of soldiers in white uniform, several hundred in number. They marched in perfect order to the summit of a hill, and were followed thither by another more numerous body of troops in dark clothing. After they had all disappeared on the opposite side of the hill, a volume of smoke arose as from the discharge of artillery, which darkened the air so that objects could

not be distinguished for several minutes. The whole spectacle occupied about a quarter of an hour.

A similar phenomenon was observed over forty years ago at Paderborn, in Westphalia, which was seen by about thirty persons. Several horses and dogs also indicated a consciousness of the apparition. A year or two after, in October, 1836, there was held on the very same spot a review of twenty thousand men. It was generally supposed that this was the event prefigured.

In the second book of Maccabees, fifth chapter, it is recorded that Antiochus Epiphanes prepared for the invasion of Egypt. About the same time there were seen at Jerusalem for the space almost of forty days "horsemen running in the air, in cloth of gold and armed with lances like an army of soldiers; also troops of horsemen in array encountering and running one against another, with shaking of shields and multitude of pikes and drawing of swords and casting of darts and glittering of golden ornaments and harness of all sorts." The expedition was at first successful, and Egypt fell into the hands of the invader; but the Romans interposing, he made a treaty with Philometor and turned his arms against Judea. Capturing Jerusalem, he massacred forty thousand people, sold as many more into slavery, and established the Bacchic rites at the temple.

Like apparitions are elsewhere mentioned in the Old Testament. The Prophet Daniel saw a vision, chronicled about the same time, which is described as closely connected with events taking place simultaneously in the world beyond our earthly vision. The prophet had fasted three entire weeks, and was standing on the bank of the River Tigris or Dikla, when a celestial visitant appeared. A peculiar quaking or shuddering drove away his companions, while Daniel himself fell to the ground in a deep sleep and paralyzed. His visitor aroused him and explained why *three weeks* had been consumed in coming to him. "The first day that thou didst set thine heart to understand and to chasten thyself before thy God, thy words were heard, and I came forth in response to thy words. But the prince of the kingdom of Persia withstood me one-and-twenty days; till lo! Michael, one of the chief princes, came to help me; and I remained [was thus detained] with the kings of Persia. . . . . Wouldst thou know why I have come to thee? I am about to go forth to fight with the prince of Persia; and when I have gone forth, lo! the prince of Grecia shall come."

This would seem to indicate that all things of note in this exterior world have their counterparts in the other. Exaltation of the mental powers brings these interior facts of the inner world to human consciousness by the clairvoyance of the seer, or the peculiar insight of the clear-seeing mind. In this way Cabanis frequently, in dreams, described the bearings of political events that baffled him while awake; and even Dr. Franklin ascertained in the same way the issues to political problems. Oberlin, the celebrated pastor of Steinthal, in Alsace, received information from his deceased wife in regard to the nature and life of the other world, and the wisest counsels in relation to his undertakings in this. She declared to him that everything on earth was but a copy of the things of the spiritual world.

It is asserted by Stilling that the overthrow of the monarchy of France was to have occurred when the young Dauphin, afterward Louis XVI., married the princess Marie Antoinette of Austria, but was delayed by that event. We have supposed that this was an example of events laid out in the other world, and postponed in this; perhaps as the destruction of Nineveh is said to have been deferred when the people repented at the preaching of Jonah. Others, however, have stated that there existed in Europe at that time a secret confederation that had planned the overturning of the various despotic governments. Among the persons said to be implicated, the Prince de Rohan, Caspar Lavater, and even the celebrated Swedenborg, have been mentioned, and Dr. Franklin, it is intimated, was cognizant of the matter. Secret agents, it is known, traversed the American colonies to disseminate a sentiment in favor of their separation from the mother country. France, enslaved and degraded to very

abjectness, under the reign of Louis XV., it was easy to perceive, would be likely first to be overwhelmed by the deluge. Perhaps Stilling was acquainted with participators in these movements. Lavater, we know, was his friend and fellow-student. But Stilling had inherited from his grandfather the clairvoyant faculty, and knew of the impending catastrope in that country by witnesses of the same character. In one of his works he speaks of a clear-seeing German woman who predicted the revolution and its numerous executions several years before they occurred. In her visions she associated these events with illustrious victims of the atrocious massacre of St. Bartholomew. Especially she remarked, as active in every direction, the celebrated Admiral Coligny, the great Huguenot statesman and leader, who had been assassinated on that occasion. She saw him going hither and thither, his clothing stained with blood.

In that singular book, the Apocalypse, the writer, John the Theologist, describes a person resembling the visitant of Daniel, androgynous, before whom he also "fell as dead." He was aroused to life and directed to write the things which he saw, those that had been, and would be thereafter. Then appeared a long series of hieroglyphical and scenic representations; at the end of which, the angel instructing him, refused his homage, saying: "I am thy fellow-servant and of thy brethren, the prophets." The events and personages of the Apocalypse are shadowed after the Oriental style of the book of Daniel: a lamb-lion, a woman in the sky—or *Virgo Paritura*, a Bacchic seven-headed fiery dragon* seeking to devour her son just born, a hydra-beast from the Mediterranean Sea, accompanied by another monster, and finally, a woman, regally clad and styled the Great Mother, Mylitta of Babylon, on a scarlet beast, also a mounted chief with an army, etc. To each of the seven churches of Asia Minor is assigned an angel of the interior world, as if to represent the elders that presided in this. In like manner it will be remembered that Moses is said to have announced to the Israelites that an angel would attend them to the promised land, to whom they should carefully adhere, and he would drive out the nations before them. Jesus also, when asked who would be the greatest in the kingdom of heaven, answered, that those would be who received His word like little children, adding: "In heaven their angels do always behold the face of my Father in heaven." Thus declaring that men in this life were represented and cared for in that world. Not only groups of men and individuals have each their double, representative, or guardian in that sphere of existence, but the princes of nations are also there, having controversies, triumphs, and catastrophes analogous to and foreshadowing like events in this world. Hence Isaiah celebrates the greatness and pride of the king of Babylon, styling him Lucifer the morning star, who aspired to pre-eminence over the other stars and to be like the Most High. But he is brought down to Hell, the Under-world, where all the dead, the chief ones of the earth, all the kings of the nations, appear before him to exult over his downfall. Ezekiel in like manner chants the greatness of the prince of Tyre, calling him wiser than Daniel, a cherub, one who had been in Eden, the garden of God; and predicts his destruction. The kings of Egypt, Assyria, Elam or Susiana, Meshech, Tubal, etc., are also mentioned as having been cast into Sheol. All these countries are thus described beforehand with their overthrow in the person of their representatives.

The Apostle Paul also alludes in the Epistle to the Ephesians to "principalities and powers in heavenly places," also "spiritual wickedness" or wicked spiritual potencies in high or empyrean regions, and an

*EURIPIDES: *Bacchae*. "Appear in form as a bull, as a many-headed serpent, or a flaming lion."

The many-headed serpent was a favorite symbol in the old-world religions, which existed from the Euphrates to the remote West, and are set forth in "The Great Dionysiak Myth." It represented Bacchus, as we have seen, who was the Baal of the East; it was identical with the Hydra, the symbol at the mysteries of Ceres and Proserpina at Lerna; Persian story has preserved the memory of Assyrian, or "Turanian," rule under the figure of Zohak; and in India the many-headed Naga is still a favorite emblem; and in the world of the dead, Takshak, King of the serpents, is the arbiter of the destiny of souls. It would seem, therefore, that the fiery dragon of the Apocalypse represented the genius of Oriental worship.

archon or "prince of the power of the air," the counterparts of powers and dominions on the earth.

From these examples we perceive that the faculty denominated prophecy, or more correctly the power of prediction, is an acuter perception of events mapped out in a medium peculiar to the other world of existence. Thus the visitant of John introduced him to a variety of scenic representations in order to show him what had been and was about to occur; and the messenger to Daniel in an analogous manner indicated to him the contests going on respecting the affairs of priests, Syria, Upper Asia, Egypt, and the Holy Land, as "noted in the Scripture of truth." In like manner seers of the last century were able to predict the impending French Revolution, its overturns and slaughters, and the new face put upon the history of Europe; and the wars in this country, in Italy, India, and China, were known to clear-seeing persons a long time in advance.

Everybody is familiar with "Mother Shipton's Prophecy" of the Crimean War, and danger to Turkey averted by the interference of the Western nations; and likewise of her prediction that the Turk, a generation later, will be expelled from Europe. The writer heard William Fishbough, in 1857, predict the Civil War and its results, among them the abolition of slavery, and a total revolution of our social and financial affairs. Joseph Hoag described in 1803 religious schisms, extraordinary movements among Freemasons, the American Civil War, and announced the subsequent subversion of republican institutions. Miss Bremer, when in Rome, in 1858, heard a nun at the Convent of the Sacred Heart, when in ecstasy, foretell the fall of the temporal power of the Pope, war and great revolutions, out of which the Catholic Church would come renovated, victorious, poor, but at the same time holy and powerful.

Wraiths, doubles, and other apparitions of individuals still living, or just deceased, are marvels of kindred character. We abound with examples too numerous to mention. Shelley, the poet, was seen a few days before his tragic death, by Lord Byron and others, walking into a wood, they knowing at the time that he was several miles away. Lord Byron himself was seen by several persons in London, when lying ill of a fever at Patras, in Greece. Dante once beheld a man who announced himself as *Dominus Tuus*, holding in his arms the lady Beatrice Portinari. He had in his hand a burning substance and compelled her to eat it; the two then departed into the sky, and shortly after Beatrice died. After Dante's own death the thirteen last cantos of the Divine Comedy were missing, and his sons were importuned to supply the deficiency by their own pens, but about eight months after that event, Jacopo, the elder, saw his father in a dream, clothed in shining garments, who assured him that he was now living the real life. The young man inquired whether the poem had been finished. The spirit conducted him to the chamber where Dante used to sleep, and touching a partition, said: "What you have sought for is here." The place was examined and the missing manuscript found. It had been almost ruined by mildew, but fortunately the letters were not obliterated. Professor De Wette, the celebrated theological writer at Halle, once beheld his own simulacrum through a window sitting in his apartment. Goethe also met himself riding on horseback, dressed in an embroidered gray suit; and eight years afterward found himself at the same place in proper person, thus actually attired.

It has been declared that by a potency existing in nature, the form of a plant, though invisible, is retained in its ashes, and has been reproduced by suffering water to freeze in which the ashes had been placed to lixiviate. Chemists have in this way obtained the form of roses and other flowers. Kircher was familiar with the art; and at a meeting of naturalists at Stuttgart, in 1834, the subject was revived and a recipe given for the experiment which was taken from a work by Oetinger. This author also discovered that the oil of balm shaped itself into the form of the leaves of the plant.

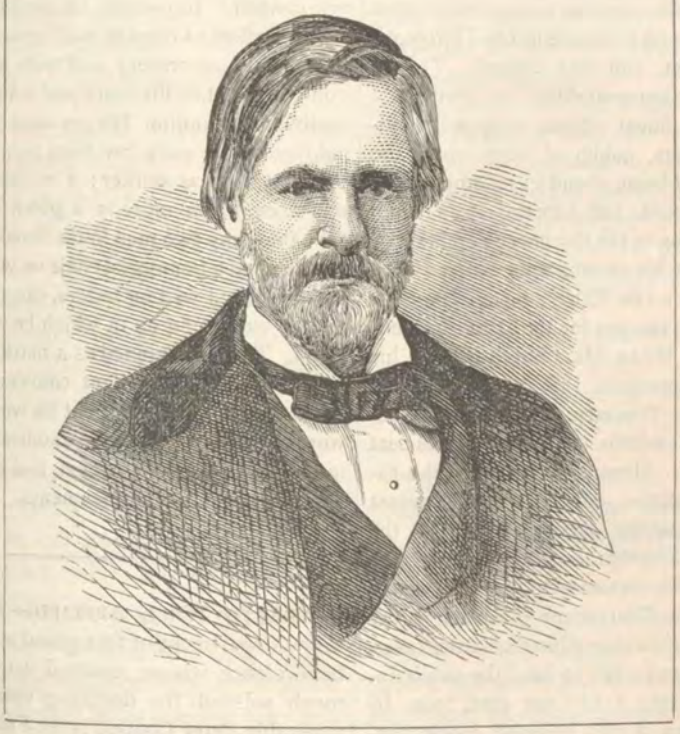
Does not this phenomenon account for apparitions also? They seem to be associated with the ideal form of a person, or

with his dead body, the earth when it lies, or with individuals to whom he was allied or akin.

As man gets older he is likely to take on new relations with nature. The germs of faculties doubtless exist in him, the presence of which are, perhaps, hardly suspected. Sometime they are certain to be developed. Perhaps much which we have instanced is abnormal or precocious, but we do not believe it to he supernatural. There is an instinct, a fortune-telling proclivity, the outcrop or rudiment of some faculty the evolving of which will be as the creation of a sixth sense. "Where there is nature," Aristotle has remarked, "there is *nous*," or divine mind. Nature is the evolving potency. It exists because of divinity, and will never be perfected till it has evolved divinity. There are, and will be, intrusions into this world's history from the realms beyond; and there will be eventually, if there has not been already developed, a sensibility to occult forces which will enable the key to be used by which to understand the whole matter. ALEXANDER WILDER.

JOHN SHERMAN,

SECRETARY OF THE UNITED STATES TREASURY.



THIS portrait, although derived from an excellent source, does not, in our opinion, present fairly the features of the Secretary. Taken as it is, however, it indicates the descendant of a family whose stature exceeds the average. The face is long from the hair to the chin, and the contours in general give the idea of physical length and slimness. The thoracial region is evidently full, impressing one with a sense of vital power and endurance. It is in his excellent breathing capacity that Mr. Sherman finds his reservoir of physical strength. He may appear slight in body to the ordinary observer because of his tallness and lack of adipose roundness, but that broad chest reveals the secret of his well-known activity and industry.

Those eyes are small, but keen and penetrating. That nose is long, emphatic, and persistent. The brain is not very large, but of fine quality and peculiarly organized. Perhaps not over twenty-two and a half inches in circumference, it is built up mainly in the forehead and crown, its unusual height giving it an appearance of narrowness. Yet there is a good base for the supply of physical energy and executiveness, and a marked prominence in the organs of perception, Individuality and Locality being specially large. The organs on the median line from the inner angles of the eyes upward appear to be large generally, and should characterize him for ability in discerning and estimating the quality and value of facts, for excellent judgment of character, for appreciating conditions and determining results. He should be well stocked with information upon all the subjects relating to his chosen line of pursuit and be ready in its application.

His Language does not appear to be large, and we would not regard him as a fluent speaker, but rather as one who uses words for a purpose; to express his meaning with precision and clearness, avoiding unnecessary verbiage. His Constructiveness does not appear to be large, and hence we would infer that he is not given to the formulation of ingenius plans or expedients, but takes and works upon the results of his intellectual consideration. Given a certain line of duty, he takes the material furnished in its connection and applies it directly, without wasting valuable time in the elaboration of grand schemes or in the contrivance of new machinery.

He has, however, much individualism, strong intuitions, which furnish the key-note

to his thought and acts, a broad sympathy, and no small amount of moral integrity. His opinions are held with great tenacity, particularly those relating to moral subjects; but he is inclined to be reticent on matters of personal morality. He has a good degree of prudence as well as of the sense of duty, so that he is not the man to bear himself lightly in the assumption of responsibility. His temperament conducing to great nervous activity, enables him to accomplish much, but he is not offhand, showy, or brilliant in his manner of working.

John Sherman was born in Lancaster, Ohio, May 10, 1823. He is descended from a family of Connecticut Shermans founded by one of the Roundhead refugees, and his ancestors bequeathed to him a good degree of courage, sterling integrity, and good sense. His father, Charles Robert Sherman, was a lawyer, and afterward Judge of the Supreme Court. He had a family of eleven children, who, at his death, became scattered. William Tecumseh, now the distinguished General, became, by adoption, a member of the family of Hon. Thomas Ewing. John attended school at Mount Vernon until he was fourteen years of age, when he was sent to the Muskingum Improvement to earn his livelihood and to learn engineering. At sixteen years of age a political change gave the

Democrats control of the Muskingum Improvement and deprived John Sherman of his home. He began the study of law with his brother, Charles T. Sherman, at Mansfield, Ohio. After a four years' novitiate he obtained a license, and entered upon practice. He formed a partnership with his brother John, attending to the court duties, and Charles doing business in the office. This partnership lasted eleven years. In politics John Sherman was an ultra Whig. He attended the Whig National Conventions of 1848 and 1852, and in the latter year was chosen a Presidential Elector. In 1854, when the Nebraska issue arose, he accepted a nomination for Congress in the Thirteenth Ohio District, and was elected. To the House of Representatives he brought a capacity for fluent debate, a large knowledge of affairs, habits of hard work, the reputation of being sound in judgment, sincere in purpose, and superior to personal considerations in the discharge of his duty. So well were his constituents pleased with his record in the Thirty-fourth Congress, that he was returned for the three succeeding terms. When Mr. Chase resigned his seat in the Senate in 1861, to become Secretary of the Treasury, Mr. Sherman succeeded him, and has since retained his seat in that body. He was placed upon the Finance Committee; and his speeches against the State banking system, slavery in the District of Columbia, and finance and taxation generally, commanded universal attention. In the Thirty-ninth Congress he devoted himself to the reduction of the taxes, and introduced a bill to fund the public indebtedness into a five per cent. loan, by which means it was believed specie payments could have been reached in 1867; but the bill was mutilated in the Senate and defeated in the House. In the Fortieth Congress Mr. Sherman became chairman of the Finance Committee, and reported a new bill for funding the national debt. This bill he supported in a speech February 27, 1868. It authorized the sale of 10-40 five per cent. bonds to redeem all outstanding debts; exempted these bonds from State taxation; provided for the payment of one per cent. annually of the public debt; offered to the holders of the 5-20s the option to exchange them for 10-40s at par; authorized the conversion of legal tenders into bonds and bonds into legal tenders; and authorized contracts payable in gold. By a large portion of the people this was looked upon as a just and necessary measure, while it was attacked by others as a violation of the pledged faith of the Government, and a step toward repudiation. In appearance Mr. Sherman is tall, straight, and exceedingly spare, with brown hair, small, gray eyes, a large head, high, square forehead, and a countenance indicating the possession of decision, firmness, and self-control. In debate, he speaks rapidly, without effort at display, with great freedom from tricks of oratory, and with animation going straight at his mark and commanding undivided attention. His personal and political history are alike free from reproach.

He is a great worker; it is said that he can accomplish more in a given length of time than any two men in the Senate. When he occupied a Senatorial chair he was generally employed writing letters, except when a debate was going on in which he was interested. Then he listened as a matter of business. He is an excellent conversationalist when he chooses to be, but he won't waste words on an idler. He is methodical, scrupulously neat about his person, and equally so about his papers and documents.

WEALTH WELL APPLIED.—The most useful department of that grand scheme of benevolence whose practical work has so much solaced the declining years of the venerable Peter Cooper, is the Free Library and Reading-room, which have been in operation about eighteen years. The reading-room is open from half-past eight in the morning until ten in the evening. There are at present 310 papers and periodicals on file, and the popularity of this resort is demonstrated by the librarian's report that 609,000 persons have visited it during the past year. These visitors have also in a single month called for 14,400 books and 2,922 magazines. In October, 1872, the Cooper Union Library was opened for the

first time on Sunday, from 12 M. to 9 P.M. This experiment, tried after much deliberation, has proved successful. The order and decorum in the reading-room have been unexceptionable, and the large attendance shows that a real want is thus supplied.

LIGHT IN DARK PLACES.

"This mournful truth is everywhere confessed,
Slow rises worth by poverty depressed."—SAMUEL JOHNSON.

CHAPTER VI.

DOUBLY ASSAILED.

MR. GAFF did not approach "Sal"—as we shall entitle her in her character as book-binder—for several days after the talk between Betty and her, which we have reported. The foreman, therefore, having the field clear, had shown her many little kindnesses, for which she thanked him modestly. The discreet Betty had assured her that Briggs, though a rather rough man, as a director of work wasn't given to making very pointed advances in his relations with the girls, unless they encouraged him by their effusive expressions of gratitude for the little favors which the ordinary routine of the shop afforded him many an opportunity to confer, in the way of assistance in the execution of difficult parts of their work. Sal's modesty and superior intelligence to the other girls commanded Briggs' respect in a way that he couldn't quite understand. He couldn't assume the "boss" over her as with the others, and this fact piqued him somewhat. He had learned of her fatherless state, and had even visited her mother, and thought to establish an intimacy which would give him a kind of masculine guardianship of her out of home-life. He saw that Betty and she were very confidential, and supposed that she would welcome the proffer of a grown man like him, and so much better related than Betty to give her advice and protection when she needed them. But when the overtures he made were delicately declined, he could not discern the motive of such declination. His intelligence and moral sense were not of that cultured order which perceives the impropriety of the gratuitous offering by a comparative stranger of attentions which belong only to the province of intimate friendship.

He was piqued by her maidenly reserve, attributing it to an assumption of superiority, which he inwardly acknowledged, and he hoped for some contingency which would compel her to seek his protection; and he was annoyed by any interference like that of his employer, Mr. Gaff, which might completely forestall his hope. He really did not care much for the moral happiness of the girls under his charge, but his nature craved domination, and he wanted to feel that he could control, if he chose, the movements of those whose earnings mainly depended upon his good-will.

"Closely occupied, as usual, I see."

"Sal" looked up quickly, and a flush mounted her cheek as she met the gaze of the junior partner bent admiringly upon her.

"Such skillful fingers as those," he continued, "should have encouragement. Hasn't Briggs made a raise in your wages lately?"

"No, sir."

"Well, I suppose he thinks we can't afford it. Prices dropping constantly, I'm sorry to say, don't give much prospect for doing what we employers would like to for our girls."

"I think, sir, that you try to do for us what is fair," said "Sal," quietly continuing her work.

"Yes, of course; but most of them complain because of our cutting them down. Competition and hard times are bad for book-binding. But we who live in good society, you know, must keep up with our neighbors. By the way (in a lower tone), Miss Sallie, this is a lovely day; say the word, and you shall have a glimpse of the Park behind my new trotter this afternoon."

"Thank you, sir, but I'd rather not."

"Oh, you needn't fear that you'll lose any part of your day. I'll make up your time. You need the fresh air. Your cheeks aren't as rosy as they were. Come now, where shall I meet you?"

"You must excuse me," half-tearfully the girl replied, "for I can not accept your kindness."

"Well, you're about the strangest girl I ever met. You're certainly not afraid of me?" persisted Mr. Gaff.

"Not exactly, sir; but I feel that it would not be right."

"Cho! Conscientious scruples! Well, I guess you'll get over some of them before many years."

Sal's cheeks flushed crimson deep at this, but she bent lower toward the sheets she was stitching, and plied her needle with nervous rapidity. As she made no response to his ejaculations, Gaff continued:

"Any other girl would be glad enough for some pleasant relief from such work as this; but if you're determined to wear yourself out, why, I've nothing more to say today besides good-morning," on which he strode off, apparently much vexed, toward the foreman's little office.

Gaff had spoken in so low a tone that Betty could catch only a word or two; but when he walked away she half-muttered to herself, "I guess he found his match that time;" and glancing over to Sal, gave her a sympathetic look, and whispered: "Don't feel bad about it, I know you've done jest right."

Mr. Gaff accosted Briggs with—"Strange girl that Sal over there. Hey, Briggs?"

"Yes, rather," replied the foreman.

"Can't quite make her out. What a figure she has! Guess Jarrett would give something to have her in his ballet."

"But you couldn't do anything like that with her," rejoined Briggs; "she's one of your *moral* sort."

"So it seems; but it's a pity she must be shut up here. It aint her place."

"She doesn't complain," said the foreman; "and never a word about short wages like the most of 'em."

"It's the bringing up, man," burst out the employer. "You can see the difference between her and the other girls in an instant. She's worth a dozen of 'em. If I wasn't married, I don't know but I'd look after her interests pretty seriously."

"I guess you'd have to court the mother too," grunted Briggs.

"You know all about her then;" and the two men eyed each other for a moment suspiciously and then changed the subject.

The two girls discussed the conduct of Mr. Gaff on their way homeward that evening, in the course of which the troubled maiden said:

"I don't know what to think of that man; whenever he comes near me, I feel a singular thrill, like a shock of electricity."

"I've felt such-like myself," said Betty, "and something tells me, 'Look out now; somebody's tryin' to git the best of yer.'"

"Mother says that we are influenced by people according to their moral disposition and motive," rejoined Sal, "and that it is well for us to note the kind of influence or impression that is made by a stranger upon us, for by it we may be warned against danger."

"How does Mr. Gaff inflooence ye?"

"I feel a sense of repulsion when he is near, and of relief when he goes away."

"I guess ye're not fur wrong in what ye think about him. I'm told that his marri'ge was made up by his father and his wife's father, they bein' old friends, and thet he was putty young when they married him; but there aint no more sympathy 'tween him and her than 'tween a duck and a rooster. I feel kinder sorry for him on that account, as he's a fine, smart man; but 'taint no excuse for going round where he's no bizness to, and coming 'mong us girls in the shop besides."

They were nearing their customary point of separation when two young men, much in liquor, lounged out of an alley immediately in front of them.

"Hello! me fine gals," said one of them, who grasped Sal by the shoulder, and leered into her startled face; "by the holy whisky bar'l you're a sweet one, and must go with me."

"Let go of her, you rowdy," cried Betty,

who, inured to scenes of vice, had the courage of a lioness when aroused.

"What d'yer say, you —. Jim, take care of the ugly old hag, will yer."

Jim, who was so much intoxicated that he staggered, aimed a blow with his clinched hand at Betty's face, but the adroit and quick woman sprang back and escaped it.

"For shame, young man! for shame!" exclaimed a rich and powerful voice; and its owner, a tall, thick-bearded man, stepped up.

Both the roisterers were startled. He who had addressed himself to Sal let go her shoulder and turned toward the new-comer, and, recognizing him, mumbled:

"Excuse me, Mr. Stanley; didn't mean any harm; only a little joke, I'll take my oath on't."

"Fine joking certainly, thus assaulting defenseless women, and your condition only aggravates the offense. I shall see you again about this."

Turning to Betty and Sal, who had drawn to one side, and were regarding the crest-fallen demeanor of their assailants with evident surprise, their unexpected champion remarked:

"Shall I accompany you home, young ladies?"

"Oh, thank you, no, sir," replied Sal. We reside but a few steps farther. But, indeed, sir, we are greatly obliged for your aid;" and taking Betty's arm, she started on a quick walk homeward.

Stanley gazed after them for a moment and then resumed his way down the avenue. Scarcely had he measured a hundred yards when he suddenly halted, and glancing back in the direction the girls had taken, spoke half aloud:

"How much alike! Brother and sister surely; and Camp's eyes and forehead, as I would know among a million."

CHAPTER VII.

A CONVERSATION ON SUBJECTS OF GENERAL INTEREST.

Mrs. Camp listened with a mother's anxious interest to Sadie's recital of the street attack. She knew full well the perils of the working girl in a great city, and although she trusted much to her daughter's intelligence and carefully educated moral sentiment to save her from the ordinary dangers of her vocation, yet she could not help feeling apprehensive lest Sadie should become the victim to unexpected violence. She therefore took such precautions as were in her power to shield her beautiful child from harm, and she found in the people of her immediate neighborhood, many of whom were indebted to her for services, seemingly little to her, but important to them, very warm coadjutors. Her co-occupants of the tenement in which were her apartments, were nearly all very kindly disposed to "Mrs. Camp's gal" and ready to do anything within their poor capabilities in her behalf. So, if after nightfall the lady found it necessary to send Sadie out, and she could not accompany her in person, a half-dozen of the women, young and old, among the fifteen in the building, could be relied upon as ready to go with the girl.

Among the poor it is that we find the best expressions of intimate and zealous friendship and self-sacrifice, and Mrs. Camp, in the course of her six months' residence in those humble quarters, had found among the poor and ignorant who surrounded her gems of manhood and womanhood, for whom she entertained a deep respect. The outward appearance might be rough and unattractive to the ordinary observer, but beneath the coarse garments beat a warm and sympathetic heart, and from the deep-set eye beamed a soul whose native intelligence and dignity needed but the word of kindness to reveal. Thus Mrs. Camp did not lack associations which were edifying even to her cultured mind, and illustrations of high character to which she might point her children when instructing them in things pertaining to human nature.

But to return to the conversation at the supper-table that evening. Sadie had described the appearance of the gentleman who so opportunely took her part, when Norton exclaimed, "Why, mother, that's very much like Mr. Stanley, who gives me the waste over in Perry Street."

"Yes, mother dear, that's the gentleman's name. I didn't quite catch it when the

drunken fellow spoke to him. I hadn't quite got over my fright then."

"He's a regular 'brick,' I can tell you, Sadie. I mean that he's just one of the nicest men."

"Judging by the tone of his voice, Nortie, I should think so too. You know, mother, how some people show just what they are by the way they speak. This gentleman has a steady, sure way, which seems to tell you, 'I mean what I say;' but it isn't that peremptory sort of tone which most men put on when they want to be emphatic; it's strong and yet gentle."

NORTON WATCHING THE CARPENTERS.

"You mean, Sadie, that it carries power with it. Men of unequal or unbalanced mind indicate their irregularity in their voice and speech. Controlled by passion or caprice, they talk in a precipitate, headlong fashion, in a high key, or else in a jerky, spasmodic style, which is wearisome to the listener. Steady, self-reliant natures are measured in their tone and language, and if they possess a high degree of benevolence, show a tenderness in their expression. A well-balanced character indicates anger by an unusual emphasis rather than by harsh, reproachful words; the manner is stronger than the language. I am very thankful, my dear child, that you escaped so easily from the drunken men. Although I think that they had in view—as that one said who tried to excuse himself to Mr. Stanley—scarcely more than making what in their maudlin state they considered fun. Then the hour, with so many people in the street, would have prevented any but those out of their head from attempting anything very rude and insulting."

"Isn't it strange, mother," remarked Norton, "that men will spend their money for that nasty stuff they drink, and then make such big fools of themselves? Last Sunday afternoon, when I went to the Mission, I stopped at Bumpy's, for he'd promised to go with me. But his father'd sent him out for some beer. I waited five minutes and he didn't come; then I started down-stairs, as I couldn't wait any longer, and on my way out I saw a man lying on the floor in one of the rooms, while a woman was sitting at a table near him with her head bent down in her hands, and two or three little children, most naked, were running about from one to the other, screaming. I asked Bumpy about it and he said the man got drunk every Sunday, and spent nearly all the money he'd made the week before, and most of the time the children didn't have anything to eat except what the neighbors gave 'em. Why don't the good men shut up the rum-shops, mother, when they know that drinking makes so many poor and hungry and sick?"

"My dear boy, I can not fully answer your question. I am sure that all good people are grieved because of the liquor-selling and liquor-drinking which they see around them, and which are maintained by people who call themselves respectable in spite of the great misery and crime which are the direct product of intemperance. It must be that the men who sell liquor and the men who drink it are numerous and strong enough to control the law-makers, otherwise the good sense and benevolence of the community would put a check upon the trade. The money, far worse than thrown away by those who drink, amounts in this city alone in the course of a year to several hundreds of millions of dollars."

"Millions—hundreds of millions!" cried Sadie; "why, mother, if this money was given to the poor families in New York every one would be made comfortable. The superintendent said in the Mission last Sunday that Mr. Vanderbilt, who died lately, you know, had a great fortune, fifty millions of dollars, and could have supported over a thousand families with his income from it alone. But to think of several hundreds of millions of dollars being spent in what poisons people and makes them crazy!"

"It's wicked," said Norton, "and I see every day where a good deal of the money the poor spend for drink goes to. There's O'Callum, down on the corner, he keeps two horses and two or three wagons, and nearly every day his big fat wife goes a riding in the Park, all dressed up, with gold rings and chains, and a black man to drive. Then you'll see O'Callum himself always dressed up in nice clothes. Why, mother, don't the poor people know that rum isn't good for them?"

"Many of them know it, Nortie, but their companions get them into the habit of drinking by inviting them to take a glass now and then. Some have such poor homes that they go to the saloons for what they consider cheerful society, and on winter nights for warmth and comfort, and so get into their bad ways. Far too many are born with a fondness for liquor because their father or mother was a drunkard, and as they are not restrained by some kind hand, they go naturally to destruction. Oh, my dear children, the lessons of intemperance are dreadful beyond expression!"

"I'll never touch the stuff, mother, never."

"May God help you, my child, to keep that resolution!" said the widow solemnly, and with an expression upon her face so full of grief that Dell's intuition half caught the truth, for the little girl exclaimed:

"Mamma, mamma, dear papa didn't drink rum, did he?"

"No, my precious one, but mamma had a darling brother once who learned to drink when he was at a boarding-school, and he could not give it up, and oh, he went on and on, in spite of all grandfather and grandmother could do, until he died. So noble in spirit, too, he was! 'Dear sister,' he said to me, not long before he died, 'if it would only put a check on this horrible rum traffic I would submit to being chopped into inch pieces.' And my poor father often said that Clarence's death was a judgment upon him, for he used to let brother, when only a little boy, drink wine from his glass when there were callers at our house, and that he had a fondness for it when he went away to school."

"You have said that I looked like uncle Clarence, mother."

"Very much, my boy. Just such hair as he had, and such a chin, and nose, and all but the more prominent eyebrows, which are like your father's. And your head is broader than Clarence's, which gives you the industrious spirit of your dear father. Industry, Nortie, will save you from many temptations to evil. Clarence was sweet-tempered and amiable, but he wasn't fond of work; he liked to lounge about and talk with young men, and it was this disposition, which father permitted to grow, which really brought him to ruin."

"I like to work. Wouldn't I be a good carpenter, mother?"

"I think that you could become a very good one, Nortie."

"Don't I itch to have a saw, and a plane, and a chisel, when I see the men working on buildings with 'em? I just do. Oh, yesterday Mr. Stanley asked me if I liked to be running around doing odds and ends of

work, and I told him I'd rather have something steady to do, though I liked to be out of doors. Then he asked me if I'd like to be a carpenter, and I said, Yes, but if I was 'prenticed to anybody I wouldn't get any wages at first, and I couldn't afford to do that, as I made sometimes two whole dollars a week. Then he laughed, and said, 'I'll have to see what can be done about it.' Wasn't that good?"

"Very encouraging and kind of the gentleman, but don't be troublesome, Norton."

"Oh, no, mother, I shall not; I only go there twice a week, and I really think that the clerks save the waste stuff for me."

"Dearest mother," said the tender Sadie, "you know what the Bible says about the righteous never being forsaken? I think God takes care of us because we try to do what is right."

"My darling," replied the widow, warmly embracing the maiden, "I know that our Father takes care of us, and all who strive to live in accordance with His precepts. We need not fear if we do the best we can."

"Mamma, I'm so sl-e-e-e-e-py," yawned Dell. "Ye sand man's got into my eyes"—and Mrs. Camp, observing that it was past the time when the youngest was usually put to bed, ordered preparations for retiring. She believed in the virtue of going to bed early, and as might be expected, the Camp family rose much earlier than their neighbors, midsummer's sunrise often finding the mother busy with her needle.

(To be continued.)

WILLIAM BLAKE.

SEVENTY-FIVE years ago, "more or less," a man living in the smoke and roar of restless London, spent a holiday in the country. It was early summer. The air was sweet with hawthorns blossoming; along the grassy banks the wild flowers showed "their little fairy faces," the sunshine, clear and warm, yet tender, baptized their delicate beauty. He saw, in the green fields, young lambs frisking beside their sober, steady-headed mothers, and this was the song that flowed through his heart, and that he, in turn, sang to the unconscious creature who inspired it:

"Little lamb, who made thee?
Dost thou know who made thee?
Gave thee life and bade thee feed
By the stream and o'er the mead;
Gave thee clothing of delight;
Softest clothing, woolly, bright.
Gave thee such a tender voice,
Making all the vales rejoice.
Little lamb, who made thee;
Dost thou know who made thee?

"Little lamb, I'll tell thee,
Little lamb, I'll tell thee.
He was callèd by thy name,
For He calls Himself a lamb.
He was meek and He was mild,
He became a little child;
I a child and thou a lamb.
We are callèd by His name.
Little lamb, God bless thee;
Little lamb, God bless thee!"

He who wrote so sweetly of Divine Love and its meek earthly emblem, wrote many other beautiful poems. He was a man of strange fancies.

Poets are apt to be very sensitive. The gift that makes them poets inclines them to be very unhappy over trifles, and a little neglect, often imaginary at that, is to them a keen pain.

But Blake had what Charles Lamb called "a poetical *clairvoyance*." Perhaps, had he lived in later years, he would have been called "a spiritualist," for he believed that whatever he wrote was revealed to him; and when people failed to appreciate his poems or pictures, he met indifference with indifference, saying that the commendation of his invisible audience satisfied him.

He was born in London; one authority says in Ireland, in 1757, and before he was ten years old, showed his gifts as poet and painter. His father was a hosier and not able to give his son an art education, though he encouraged his tastes. He haunted the places where engravings and paintings were exhibited, feasting his eyes on line and color. He was apprenticed to an engraver, and he also painted in water-colors and drew fantastic illustrations for his writings.

He died in 1828; and, for half a century,

the busy world has had scarcely a thought to bestow upon him.

In the last winter the story of his peculiar life was re-written, and his strange pic reproduced in heliotype.

H. E. G. PARDEE.

MY DREAM.

My dream! Oh, would it were a dream!
At midnight deep, o'ercast,
My frail, rude raft on ocean waves,
'Midst angry billows, tossed;
When, suddenly, at rudder-beam
A demon fierce appears,
With hideous grin and raging yell,
To multiply my fears.

I stand appalled! then rush to thrust
The demon from his hold;
But, fired with fury, he resists,
And I lie stunned and cold.
My raft is glazed with ice—I slip,
Yet struggle wild to catch,
And hold, at length, by finger-tip,
And weary—waiting—watch.

For days, and weeks, and months, and years
I wait, and still he holds;
Prostrate, I clutch, and cry: "God save
My raft from ruin's folds!"

The ice melts off—my hold grows firm;
My hopes rise up amain;
But ere I know, the demon's breath
Out-pours—I slip again.

Again I catch, and waiting, watch;
Again I hope to save;
But now the sea rolls over me
Its all-devouring wave;
And still I cling, and still I strive—
Naught can my soul o'erwhelm;
I know the end must bring me peace,
For Jesu guides the helm.

At length, worn out, my hold I loose—
In Jesu's arms I waft;
I feel that I've no power, and cease
To struggle for my raft.
When lo! the demon disappears!
My raft floats back to me;
In casting all my care on Him
I and my raft are free.

MRS. E. P. MILLER.

RECOLLECTIONS OF A PHRENOLOGIST.

No. II.

ABOUT the year 1850 a gentleman called for a full written description of character, and at the close of the description this statement was added as a kind of summing up:

"I judge that you are a self-made man; that you have had little help; you have worked your own way, and began early in life to do it. We suppose that from fourteen to sixteen years of age you left the hills of Western Connecticut and went to your nearest market-town—not New York—and walked three times up and down the main street to see which was the best store in the place; and having come to a conclusion, you entered, asked for employment, obtained a situation, and were thoroughly faithful in all your duties, keeping your eye on the desk and office of the proprietor, anxious to please him and serve his interests, and rise to distinction in his confidence; you attended to your business and did not skylark and frolic with the rest of the clerks, who disliked you because you would not join with them in their amusements. When you were twenty-one years of age you went into partnership with the proprietor, married his daughter, continued the business and got rich."

This being taken down in short-hand with the rest, was written out word for word. The gentleman agreed to call the next day for his description, but declined to give his name. We asked him for some initial, or any designation, and he said "W" would be sufficient; and paying the bill, he left, being informed that he could come in the next day at a given hour and it would be ready. Accordingly, he came in and read the document about twice or three times through in silence, folded it, put it into his pocket, buttoned up his coat and overcoat and put on his gloves. Of course, I

was anxious to know what he would say about it, whether I had made a mistake or otherwise. He walked up and down the office four or five times, and stopping short, said:

"I left the hills of Western Connecticut, as you say, when I was fifteen years old; I went to Newburgh, and, as I remember, walked just three times up and down the main street for the reason you stated, to see which was the best store; I went in and made application for a situation. They said they did not want any help; but after a few minutes' conversation they said I could come; and I never knew till now why the young men seemed to be down on me, but I now understand it; it was because I would not frolic, but would work and attend to business. When I was twenty-one I went into partnership with the proprietor, and he had no daughter, but had an adopted daughter. I married her, stayed with him in the business about fifteen years, and retired with thirty-six thousand dollars, and am now auditor of accounts on the Erie Railway, and doing most of the work of a bank, and have a nice farm that I conduct besides, and am thirty-six years old."

Of course, my description was an inference from his organic constitution, and the man had followed out his natural bent so thoroughly that the statement and the history corresponded literally.

In 1859 the ship *Dreadnaught*, bound from Liverpool to New York, under the command of Captain Samuel Samuels, had on board a terrible mutiny. There were thirty men, besides six boys and five officers, and two hundred and fifty-three passengers. The captain observed that his crew was made up of the basest materials. They had planned to disobey and do as they pleased on the voyage, and finally refused to work. He stopped their food, and said:

"Now, boys, I have determined that you shall have no more food in this ship unless you return to your duty; and I can give you for this each five years in the State prison and a fine of one thousand dollars. Now, I call upon any of you to return to duty and to come to me, and I will promise to protect all such, and if any man attempts to prevent such persons, I will positively blow out his brains."

They replied, "No, captain; we have all put our foot in it, and we will hold together and have it out."

Captain: "You will be hungry by and by, and will think differently."

Crew: "No, captain; if there is provisions in the ship we will take them."

Captain: "Men, I have hired you to work; I have paid you; I have fed you well and treated you kindly; you have refused duty; you rise in open mutiny, and I have stopped your food. Now, if any man dares touch anything on board this ship now under my command, I swear that I will shoot him."

Crew: "Oh, but, captain, pistols sometimes miss fire, and our knives miss never. We would have your heart's blood."

Captain: "I don't fear you. I might shoot you any time. If the ship were in peril, I would certainly do so."

He then went forward alone upon the other side, having his pistols concealed beneath his jacket. One of the men seeing him alone, and as he supposed defenseless, sprang forward with marline-spike in hand, exclaiming, "Come on, boys, we have got the bloody ——!"

But the captain was too quick for him; drawing the pistol he presented it to the man's head, saying, "One foot farther and you are a dead man!" The sailor beat a retreat. The men then came rushing, with loud shouts, upon deck. The captain stood firmly with up-raised pistol. "Death to the first man who advances," said he. Then commenced a scene that beggars all description; the men uttering language the most obscene and profane—all swearing and shouting together, all urging each other forward, but each unwilling to be the first to meet the fatal pistol. The captain still stood unmoved, and quietly awaited the moment when he could be heard. He again demanded of them that they should return to their duty. This they refused, with one consent, to do. He then promised to defend and protect any one who would come over to him; but no one moved. "Now, men, what have you to expect? I shall raise my signal of '*Mutiny on Board*,' and how long will it

be, think you, before I shall have help, and how will you escape the consequences? I am master of this ship, and while I live will be here obeyed. I demand of you, in the first place, that you all throw overboard those knives, and then go to your duty."

Crew: "But what guarantee have we, captain, when we shall have done so, that you will not fire upon us?"

Captain: "This—that I do not fear you with knives in your hands; I certainly should not dread you when unarmed. But to satisfy you, I will give my pistols into the hands of any of the passengers, to be held by him until we arrive in New York."

"Well, shipmates," said one burly fellow, "there goes my knife;" and one after another the knives were all tossed overboard. "Now, captain, our knives are overboard, will you give us watch-and-watch?"

"No, men! there is where we started. You shall not dictate terms to me. I am here to order, and you to obey. I will be obeyed; you shall not have watch-and-watch again on board this ship."

The captain then walked aft and called out for all hands to "Haul taut." The men did not come creeping along, but they came on the run and pulled with a will, so that the captain had to call out, "Easy, my men, or you will carry away that rope." After this the work went smoothly on, but it was evident that the men were very nervous, and fearful as to what the captain intended to do on his arrival. The men soon after came, one at a time, and begged the captain's pardon, promising to behave themselves; and they did behave themselves. An account of this mutiny had appeared in the morning papers, and I had read the account, which was filling the city with wonder and admiration. A stranger came into the office quietly and asked for a full examination. It was dictated to a short-hand writer to be written out extendedly. The closing paragraph of which, as a kind of summing up, was as follows: "You are known for social power, for bravery and thoroughness, for independence and will power, for respect, for criticism, for practical judgment, and for an independent, frank cast of mind and character. You are distinguished for your courage and self-reliance, and had you been commander of the ship *Dreadnaught*, which has just arrived in port, you would have pursued much the same course with the mutineers as Captain Samuels did."

He looked up and remarked, "I am Captain Samuels himself."

This whole matter was published in the PHRENOLOGICAL JOURNAL for November, 1859.

The late Honorable Nicholas P. Trist was sitting for an examination to be written out in 1851. During the examination he looked up three times and insisted on knowing if we recognized him, or if we had any idea who he was. Finally we said, "You have the love of justice so strongly marked that it is almost a mania with you. You are firm and unflinching; you are systematic and careful, and these traits combine to make you exceedingly tenacious in respect to that which you have occasion to do or to be responsible for. And if you were a diplomatist, you would be considered, perhaps, captious by those who were negotiating treaties with you, or discussing any subject, because you would want to have the phraseology just exactly as you understood the meaning of the convention to be, and your patriotism is so strong that you would even go against the instructions of your Government, and risk its censure, if the circumstances, in your judgment, warranted it, and trust to the future for your vindication."

He looked up with his sparkling eyes and slapped his hand on his knee and said, "Tell me, sir, honestly, do you know me?"

"No, sir; I have not the faintest idea of who or what you are."

After the examination was completed, and after he had got the written statement in his hands, finished, he gave his name and related something of his history. He was the United States Minister Plenipotentiary to Mexico, and made the treaty of peace with that country at Guadalupe Hidalgo, which closed the war with Mexico, and ceded to the United States the large territory embraced in California and New Mexico. But for political reasons Mr. Polk had made up his mind that he did not care to have the treaty of peace concluded just

then, and had sent on an order recalling Mr. Trist. But the Mexican Ministry having the treaty nearly completed, begged Mr. Trist, since he knew the circumstances better than his Government could know it, to finish and sign the treaty, and leave it for the Government of the United States to accept or reject. Mr. Trist did so, and though he was practically a prisoner on the way home, under the fiction of the guard of honor, or military escort, he was censured by the administration, but the Senate of the United States ratified the treaty of peace, and Mr. Polk signed it, and for twenty long years Mr. Trist was tabooed by the party who sent him there. But when he died in 1875 he was postmaster of Alexandria, Va., and a more faithful, honest, thoroughly reliable and good man never bore office in the United States. He married Mr. Jefferson's granddaughter, Miss Randolph.

In 1875 I was describing a man, making a full report of it to be written, and said to him that he had "such an exact sense of size, form, and quality that he would learn to judge of the height of trees, or estimate the weight of cattle by their size, with a kind of intuitiveness which would enable him, with memorandum book in hand, to go through a drove of a hundred oxen, and in less than a hundred minutes put down their weight, and not vary on an average ten pounds on each."

The man looked up, smiling, and remarked, "Oh, I can do better than that. That is my business. I bought a hundred and seven oxen last week and varied only four hundred and fifty pounds from the weight afterward ascertained by the scales."

When I asked him whether the oxen weighed more or less by four hundred and fifty pounds than he estimated them, he remarked, with a proud shake of the head, "Oh, they weighed more, *of course*."

Another case of a similar nature. In May, 1877, a gentleman was being examined, and his character written out, and I stated that he had remarkable development of the organs which combine to give a man intuition, ready judgment of truth, practical talent, and that if he were engaged in cattle buying he would be very accurate in his estimative judgment; or if he were in the insurance business he would become an expert in adjusting losses, and that he would also make a good hand to go into a burnt district to buy the damaged goods to be renovated and put on the market. He looked up and said, "Do you know who I am?"

"I don't, as the saying is, know you from a side of sole leather, except I know you are not the sole leather."

When the examination was completed he inquired if we would have all that written out word for word as it had been uttered. We replied, "Yes." "Very well," said he, showing his card. "I am the president of one of the fire insurance companies in the city of New York, and I have acted for many years as adjuster of losses where our company and perhaps a dozen others were interested. And this very day several companies insist that I shall leave my office and go all the way to Chicago to adjust the loss by a large fire, and to-night I expect to start, but having a little leisure to-day I dropped in to see what you would say about my organization." NELSON SIZER.

HOW REAL LIFE TESTS THEM.—A Burlington paper thus half humorously tells some square truths: "Of twenty-three young men who recently stepped across the threshold of life from an Eastern college, and went forth upon the trackless ocean of life to battle with relentless fate, and win renown or a glorious death in the arena, eleven are clerking in auction stores at $14 a month, one is running a fish-boat, two are learning the house-painting trade, one starved to death before he had been out of college a week, one is driving team on a street contract, two are tramps, and the others are living with widowed mothers, who are their only support. Fact is, brethren, when old Life grapples its hooks into a man's collar, it shakes all his arena and ocean and battle business out of him so quick that in six weeks, if he is alive, he knows more in a minute about the price of pork and flour than he can tell you about a Greek root in six months."

PEACEMAKER GRANGE.

"The age culls simples;
With a broad clown's back turned broadly to the
Glory of the stars."—*Mrs. Browning.*

CHAPTER XVIII.

THE ANGEL IN THE HOUSE—THE FIRST-BORN.

THIS series of Peacemaker Grange sketches draws to a close. We pass now over an entire year and into the following spring. Again the Rev. Edgar Anthony is at Mid Haven. It is April. There is a fine development of vegetation in that South-land. The hour is eight in the morning. Edgar has breakfasted, and wonders that his friend Herman does not appear—not knowing that he was called away late at night to the iron-works at West Haven, to attend to a matter wherein his practical business talent was available. Edgar tarries awhile in the chapel, and dwells fondly upon the tastefully-painted mottoes on cards that adorn it. Everywhere in these buildings one meets pithy sayings of the wise and good in quaint, medieval, illuminated letters. Here are some of these utterances: "Whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report." "O Liberty, what crimes are committed in thy name."—*Madame Roland.* "The great vices of our time are simply lying, cheating, and stealing."—*Nation.* "And they hearkened not unto Moses for anguish of spirit and for cruel bondage." "Charity never faileth." "Honor all men."—*Paul.* "Freely Religious: not freely Irreligious." "I am among you as him who serveth."—*Christ.* "He who has God, has all things."—*Molinos.* "Strive to be in the spirit and power of those who gave forth the Scriptures."—*Geo. Fox.* "What neither passion, nor grief, nor genius can discover, reveals itself to you in prayer."—*De Staël.* "In my Father's house are many mansions. I go to prepare a place for you." "The 'Peace of God' and the 'Rest of Brahm' the same, yet not the same." "Try the spirits—whether they be of God." "Be ye holy, for I am holy."—*Jehovah.* "Thou wilt not leave us in the dust; Thou madest man and Thou art just."—*Tennyson.* "Naught is there under heaven's wide hollownesse that moves more deare compassion of the mynd, than WOMAN brought t' unworthie wrechednesse, thro' envie's snares or fortune's freaks unkynd."—*Spenser.* "Unspotted from the World." "Come unto me all ye who labor and are heavy laden."—*Christ.* "They were strangers and pilgrims in the earth." "The prayer of Confucius is unceasing."—*Confucius.* "The fruits of the Spirit are Love, Joy, Peace, Long-suffering, Gentleness, Goodness, Faith, Meekness, and Temperance. Against such there is no law."—*Paul.*

Impatient to talk with his friend, whom he only saw for a few moments the day before, he goes to Herman's sitting-room or parlor.

Who greets him there?

Why, the blooming Alice, of course, looking rosy and happy, and just a litle matronly. She smiles very sweetly and shows her fine double row of pearly teeth as she says: "He has waked at last, but vows that he is having such a good time with the baby in bed that he will not get up. Why, he is only just a bigger boy than the other one. They understand one another perfectly, are full of hearty sympathy and mutual appreciation. Come in and see them."

As Edgar entered the neat bedroom, with its substantial cottage furniture and a prevailing tint of blue in the colors, the four-months' baby was in the act of tugging his father's head from the pillow by one ear and one side-whisker; while pater was pretending to be asleep.

"Ha! ha! your reverence has caught me. I tell you no one knows anything about life until he has been through this. The small Edgar Anthony here has taught me more of what you call the arcana of the universe than the big one ever did; in fact, more than any one has taught me, except that big girl Alice, who stands there looking so jealous and unhappy. I tell you, her 'nose

has been broken,' as they say of children, ever since this youngster came around. She has no chance at all at her other boy."

Hereupon big girl Alice, radiant as the morning star, had, of course, to make a rush for her biggest boy. She rolled the chubby little Edgar away from Herman, saying, "Go away, naughty baby—this is my boy."

Baby was "old enough to take notice," and entered fully into the spirit of the scene. He had met only smiles and kisses so far in life, and saw in every rebuff only a rougher caress. So he was soon "right on deck" again, venting his crows and little shrieks in a perfect gale of excitement.

Meanwhile the young minister looked on, both delighted and saddened; for as yet he and Miss Edith had not come to terms. He had been called back to his pastorate soon after the date of the previous chapter, and been confined to church duties and routine quite steadily ever since, on account of the increasing infirmities of the rector, whose assistant he was. It was evident that the elder pastor was in a decline. Edgar knew that he was a favorite with the congregation, and that the chief pastorate, with its ten-thousand-dollar salary and perquisites would soon be offered to him. His prospects were bright in the direction of conservatism; but his growing doubts of some of the "Thirty-nine Articles," and his long visit at the Grange had spoiled him for a conscientious fulfillment of the duties of the office. He and Edith had maintained a dignified correspondence; but they had not yet exchanged any vows.

As Edgar sat there looking at that "holy family," he muttered in the Greek of the old tragedian, "*Annumina, innupta, electra!*" and had visions of similar possibilities for himself. Presently Alice was called away to household duties; and sitting by the bedside, Edgar entered into serious converse with his friend.

"So you find your brightest hopes quite realized?"

"More, more than realized! Oh, what a series of joys! You know that you lent me those books, 'The Angel in the House—the Betrothal;' 'The Angel in the House—the Espousals.' After going personally through those sweet experiences, here comes now 'The Angel in the House—the First-born,' to cap the climax."

"And you think this thing is to continue right along; and that 'blessed is the man who hath his quiver full of them?'"

"Yes; here, if anywhere on the earth, can a man realize the full joys of conjugality and paternity. You know I have some property; and in the ordinary course of things I would have married a society girl, full of all the absurd notions of the proprieties that infest such brains. I should have had a brown-stone front in New York, just inside the sacred precincts of Murray Hill. I might have managed to hire and pay for three servants, and live through what you call their moods and tenses, mutations and mutinies. I should have had to pay for ten times the house-room, etc., I needed, and go a round of society routine, the most of which would have been quite disagreeable to me. Half my life would have been artificial. My wife as well as myself would have been burdened with all sorts of unnatural cares and ceremonies. Here all is natural. There is no waste of time, effort, or money. We have all of good that ordinary civilization can show, with not a quarter of its drawbacks."

"And there is no dread of raising children?" said Edgar.

"No, indeed. Of course, when the society was young and comparatively poor, there was need of caution in this respect. But now, with abundant capital and more demand for our products than we can supply, and varied industries that insure constant employment, we do not hesitate to follow the natural course in this respect."

"You talk like a veteran Peacemaker."

"I feel like one. I am thoroughly identified with this Society, and feel already as if I had never lived elsewhere."

Just here the infant Edgar sat up on the bed and began to clap his hands "patty-cake" fashion. "See that little image sitting there laughing for joy, with the blue eyes of his mother," said Herman. "I remember you used to say that the hardest passage in the Bible for you to understand was the injunction of Paul—'Rejoice evermore.' It seemed to you quite impossible

to understand the frame of mind that could comport with such perpetual joy. And I must say that I have experienced the same difficulty. But since this embodied joy has come into my heart and home, and he is only a little more cheerful than his mother, I see plainly that these two clearly voice the prevailing tone of the natural and still more of the spiritual world; and 'Rejoice evermore' seems written all over the face of creation."

"Yes; I must admit that nothing has so nullified my pessimistic tendencies as the perpetual jocundity of good women and good children. Truly their angels must always behold the face of their Father in Heaven. They are perpetually bathed with celestial sunshine. There is no night in their souls, even as it is in Heaven. You remember the popular picture of Dante and Beatrice. I think it well illustrates the different attitudes of the two sexes with reference to this matter. Dante is walking and talking with Beatrice in the spiritual world. He is moving on a lower plane than that on which she glides, though they are side by side. He is in the shadow. The continual gloom of his atrabilious temperament appears in his face. The attitude shows that he is reasoning with her, perhaps of fate, free-will, etc. She is serene and beautiful, bathed in light, 'clothed in white Samite.' Heaven's sunshine is on her. She may be supposed to be replying to him in the language of Tennyson."

Just at this time baby Edgar has crawled through under the bolster, and is peering mischievously at his father, as if to say, "Now for another round." Herman caught him in his arms and kissed him repeatedly, while the little creature chuckled and frolicked and struggled and kicked, like a canary taking its morning bath.

"They talk about little fishes living on water," said the happy father. "Why, I believe this youngster gets half his fat from kisses and other caresses that impart magnetism. Herein we find an everlasting negative to the horrid doctrine that babies should be taken from their parents in a great measure and raised as the children of the community. The palatial, excellently-kept foundling asylums sufficiently disprove that theory."

"As I see it," said Edgar, gravely, "the most important influence of this new angel in the house is to dissipate any lingering inclination you may have had to believe in free-love doctrines. I remember you were at one time somewhat impressed by the specious arguments of those who say that we need variety in love—need, as we change, to change our companions; or else there is an inharmony of temperament. Whatever may be necessary and right in rare, exceptional cases, I can find no such general rule in human nature; and your experience during the past year and a half must have inclined you to shun more and more 'the sensual feast, the reeling faun,' and to let the ape and tiger in you die a natural death."

"Yes, indeed, Edgar. Even the white purity and innocence of a sweet young girl—who gives herself wholly to you as a wife, and seems incapable of any but right and noble thoughts or actions in this connection—needs to be supplemented by the innocent gambols and winning, artless, and endearing ways of the little prattler who soon comes to her arms, before the true-hearted man can see all the pros and cons of that question—can realize the length and breadth and depth and height of true conjugality. That clear-eyed boy in the arms of his clear-eyed mother rises up in vision to rebuke me when my thoughts incline to stray toward the forbidden fruit of unlawful pleasure."

CHAPTER XIX.

Edgar Anthony found Peacemaker Grange without any important change. It had passed unharmed through the first year of the hard times. Its wise leaders were not among the number of those who expected that the waves of financial trouble would soon subside. They had foreseen and predicted the panic, and trimmed their sails to meet the gale. Knowing that the policy of contraction, initiated by Hugh McCullough, as a means of carrying out his selfish personal aims, would result in a great depreciation of real estate and personal property, they had sold everything in the shape of

such assets that was not needed for carrying on business; and had passed the word to members and friends to do likewise. The consequence was that few rural regions could be found in the country where the people were so well prepared for the storm. Feeling that it was their high mission to help demonstrate the feasibility of the associative life, and that all legal means of substantiating their financial position were lawful to them under the circumstances, they acted as shrewdly as the wisest of the capitalist class who had precipitated the crisis. They invested in Government bonds, knowing that those securities would appreciate, as was intended. They also kept on hand all the greenbacks that they could conveniently carry. Knowing that the New York city banks would be among the last to allow their stock to depreciate, and that they would keep paying dividends out of their surplus, the Judge had taken care to give the Society a good allowance of that sort of stock. He felt that it was exceedingly necessary to keep the Peacemakers on their feet as to money, and that they should imitate the old Jews during their first efforts toward freedom, by "spoiling the Egyptians," and even taking usury from "the nations round about," while refusing interest from each other, except at a very low rate.

So the Society was scudding under rather "bare poles," but in perfect safety. Continued effort was made at a quick turning over of money. No new enterprises were undertaken that would not be speedily remunerative. Everything manufactured was gotten up in such a thorough manner that their wares were already spoken of with the same commendation as are those of the Shakers. With regard to the private currency of the Association, as the process of contraction went on, they began to be alarmed at the distance at which it circulated, the amount that never came back, and the constant need of new issues for their own use.

After Herman finally got himself dressed and breakfasted, the two friends walked out over a portion of the estate; the young father insisting on taking that inevitable baby along in his little carriage, in spite of the half delighted, half angry protests of the fond mother. There were not many new buildings to be seen. Two more wealthy sympathizers had built villas on eligible sites; but they were not allowed in any way to encroach upon the rights or privileges of the poorest members.

The spring morning was fresh and clear. The roar of the falls and the hum of the factories were heard. The plowing and early planting were in progress by various happy, sportive groups. Everywhere life and zest were given even to the rougher work by the presence of robust women and girls in tasteful "bloomers."

"Would you rather work here than in the factories?" said Edgar to a girl in whose cheek the rose was not half concealed by the nut-brown hue.

"I like it well for a change; but I work in the factories and shops also, and teach a writing-class in the afternoon."

To a thoughtful man who was guiding a gang-plow, he said, having had a previous acquaintance, "Are none of you frightened here? The gloom deepens over the land; wages are falling; and men and women are everywhere being thrown out of employment. Tramps abound."

"We have small fear here. Look at this broad domain—twenty thousand acres. See how snug we are. We owe nothing. For years we have fed our people mostly on the products of the soil. We can raise what wool we want for clothing, beside what little cotton is needed, which we certainly can obtain in exchange for other products. But oh, sir, it is love and wisdom we rely most on—love and wisdom in the leaders to lead us wisely and unselfishly—love and wisdom in the led to follow peaceably and quietly in right ways.

Meeting Judge Templeton, Edgar said: "Judge, if this sort of living becomes common in the earth, the Malthusian theory will have to be revived. Such peace and plenty and ease and comfort for the many will soon cause the earth to be overstocked."

"Never fear. You should already be aware that people who enjoy all the amenities of life, such as abundant entertainment

and diversion for the mind, are not so fecund as the poor and oppressed, whose range of enjoyment is so very narrow. But the over-population of the earth is still far off. Portions of China appear to be the only places yet overstocked. Why, it is estimated that the fertile valley of the Orinoco could furnish food for the whole population of the globe. But come now, here is a vision that sometimes rises before me. The earth is full of happy, enlightened, noble people, quite full, and this thing has been long threatened and provided for. The isles of the sea are full; the mountain tops; the deserts have been made to blossom, and they are full. The poles are populated clear across by a hardy people, who find life enjoyable even there. Untold millions swarm upon the rivers and seas, living upon fish. All swamps have long ago been drained. All jungles turned to gardens. No spot upon the earth is unpeopled or unproductive. And at last the telegraphic dispatches from all quarters concur in the statement that the turning-point has come; that henceforth, unless population is decreased, general short rations and then general famine will ensue.

"And now a strange thing happens. The whole earth has been divided into townships, each containing and owned by one or more coöperative societies. Representatives from each township hasten to the county seat. For what purpose? To draw lots for a great sacrifice of and for humanity. Two centuries before the sages had given warning that about this time the famine must begin. And what had the people done? They had met everywhere in convention and listened to plans and propositions. Mind you, all sorts of reasonable stirpiculture had already been practiced, and there was the average number of children in each family. But in the absence of war, pestilence, and disease, the inevitable three-times-one-is-three had at last threatened doom. Many had advocated celibacy. Indeed, the crisis had been postponed a whole century by the voluntary celibacy of young people who could not endure the thought of being a party to the plan upon which the majority settled. It was this: As no life is complete without conjugality and paternity, it was concluded that all should have a chance to enjoy them, even if it was necessary that the average span of life should be curtailed. So it was decreed finally, in the great Areopagus of the nation, that it should be made optional with the young people of that generation which came into maturity thirty years ahead of the crisis, to individually choose whether they would remain unmarried or drown themselves at the age of fifty.

"Now I saw in my vision that the vast majority of them had agreed to the drowning, which would last but a minute, rather than forego the normal life for thirty years with a true mate. Well, the time came to draw lots in every county, for the word had passed that a thousand millions—a small part of the population—must go at once to the spirit world, or else a great check must be put upon population. So the thousand millions were chosen out of all the earth. Then I saw them cheerfully trooping toward the seaports, where steamers had been prepared with barges alongside that could be sunk beneath the waves and brought up again. They went even with song and gladness, went like the periodical sacrifice of maidens in the Greek fable. They uttered themselves thus: 'Adorable Creator, we had hoped that Thou wouldst have interposed to prevent this: but we know that Thou hast more room for us in the celestial country. We go now gladly into Hades, to make room for other happy husbands and wives—fathers and mothers.' So I saw them bidding adieu to children and friends at the wharves, and that there was no excess of grief over this long-expected event. Then they went down into the sea, and afterward they were brought back dead, and the mated ones were clasped in each other's arms. They were buried at the public cost with great pomp, and monuments reared over them as martyrs. And their children continued to 'increase and multiply and replenish the earth' on the same terms until a new sacrifice was called for."

"Judge," said Edgar, with a little irony in his tone, "I appreciate the drift of your vision; but I feel like asking you to 'take my hat,' as they used to say. That vision is a little ahead of anything of that sort I

have met. I really feel ashamed of not being a husband and father during the present lack of people in the earth."

In another chapter what remains to be said about Peacemaker Grange will be presented. S. LEAVITT.

(To be continued.)

MADAME BRINKERHOFF AND PHRENOLOGY.

IN our June number a short account of Madame Brinkerhoff, the eminent vocalist, was published. Since that time some interesting data concerning the lady have come into our hands, and as they have a peculiar relation to Phrenology, we have reserved space in our pages for them.

Madame Brinkerhoff ascribes to Phrenology the power she has possessed from girlhood to fill out her life according to its teachings, to be worthy of herself. Years ago Mr. Fowler was lecturing on Phrenology in a pleasant hall on one occasion, and looking over the audience, he asked as a favor that some would kindly come forward and permit him to examine their heads publicly. Such as had friends present he would prefer, for their testimony's sake. No one offered for some moments. At length a little girl, with two plaits of golden hair tied with blue ribbon, rose up from her seat, took off her bonnet and quietly, seriously went up to the platform. He smiled upon her kindly and complimented her courage. He turned her profile to the audience and then began moving his hands gently over the head. The little girl's blue eyes looked firmly into his as he drew away for a moment and then placed his hand upon her head again, saying: "I do not know this child; have never seen her before, to my knowledge; therefore some one here may be astonished when I say deliberately that I hold my hand on the head of a child remarkable for force of character and mental development. Her mental curiosity is insatiable. She is a great reader—a passionate reader. Lighted paper and matches have served to keep a little more light for her as the flickering candle, if she had one, would wane. Even the moon, I dare say, has served my little subject here to satisfy her cravings for reading. She can go without eating for many hours, and even hide away for her loved books. This feeling must be taken charge of and rightly directed.

"Her nature is frank and truthful. She hates lies; if she ever has told any she hates herself. She is a critic by nature, having judgment and high standards even now. She is not religious; that is to say, she abhors form. I feel sure that if taught the Lord's Prayer, by this time she has left off saying it, unless she is conscious of desiring to pray, but not for form sake. She is probably the most attentive listener to the minister in church; but that is because she intends to find out whether the minister can take up the threads of his discourse and win her to his way of thinking. It is an intellectual game for her; she is willing to be beaten if he can do it. Reverence, therefore, is small, and should be cultivated. She loves the sublime. Benevolence is large; she does not like to look upon suffering of any kind; wants to help every one. This needs watchfulness, or she will be imposed upon. She will give the impression of being an energetic person. It is not her nature; that is her will power. She can make herself do whatever she thinks she ought to do; but I will draw you a true picture of her if I place her in a rocking-chair, her feet on a stool, and a book in her hand. Yet her executive powers are immense, and her endurance great."

Here Mr. Fowler rested for a moment, and then said: "I do not know what the little lady's pecuniary position may be, but she will be a fortune to any man she may live to marry. She has more soul than most girls, as well as a warm heart and pure nature. Her musical powers should be good. Tune is very largely developed; also a great capability for languages;* in fact, I am so interested in this subject that I shall beg of her to give me a fuller opportunity for examining this highly developed organization at my office."

This opportunity was afforded Mr. Fowler by Clara Rolph, for she it was. Later, or when Madame Brinkerhoff, Mr. Wells testified to the growth and filling out of her brain, as predicted by Mr. Fowler. Madame Brinkerhoff has literary talent; and musical art, in all its branches, is her debtor.

* The lady sings in six languages.

Department of Literature, Science, Education.

True philosophy is a revelation of the Divine will manifested in creation: it harmonizes with all truth, and can not with impunity be neglected.

THE FALL OF THE TROUBADOURS.

THE sun was rising in an unclouded sky. The lofty towers of ancient Beziéres, situate upon the southern slope of France, just shut in from the Mediterranean by a narrow coast-line, were tinged with a pale red; and then all the city grew radiant in the early light. Thus it had appeared on other mornings until it came to be said in all the country round, "If God dwelt upon earth, He would wish to dwell in Beziéres." But that day nature was at variance with herself. The vanguard of the greatest army that had assembled in Europe since the subjugation of the Roman empire, and more ferocious than the savage hordes that fell upon Rome and sacked the eternal city, was before her gates. Within all was commotion. The leader of the besieging army had called upon the beleaguered inhabitants to renounce their religion or be put to the sword, and they had hurled back the soul-stirring defiance, "Death is nothing; faith is everything." There were some in the city who, like the invaders, were of Romish faith. These had begged for mercy. But the ferocious commander, exasperated at the stubbornness of the town, declared that if the whole city did not acknowledge their fault, they should *taste* of one curse, without distinction of religion, sex, or age. There were pale faces and sickening hearts in that city then; but faces were doomed to grow paler and hearts to be torn with agonies never known before, ere that terrible storm should pass. The courage of despair, which sometimes blesses mortals, fell upon the environed city. They hurled wide the gates and rushed upon their enemies; but the battle is not always to the brave. Scattered, torn, and bleeding, they were driven back and into the city, while mingled with them in terrible confusion the fanatic army entered the gates. "Kill them all," shrieked the legate as he brandished his bloody sword on high; "kill Catholic; kill heretic; God will know His own;" and above all the clang of armor and the groans of the dying the terrible death sentence was heard echoing along the destroying host. There were thirty thousand people in that city—all doomed to die that day. It was a terrible time. Why did not the God of the eternities darken the face of the sun?—for He heard the screams of those women as the swords of the soldiers hacked them in pieces; the wailings of those infants as they were caught upon the points of the swords and hurled bleeding at the mothers who bore them; the agonized shrieks of the children as they were crushed beneath the feet of horses and men; and the great bell in the church of St. Nazaire tolling, tolling, in mockery of the Christian's death. All day long the reeking swords kept swinging; all day gory hands kept striking, but as the sun sank low in the west the work was done—the prophecy of the morning was fulfilled; the curse had been visited. When day faded into twilight, the bell tolled less loudly, and finally died away upon the wind; and when twilight darkened into night, the towers that glowed in the morning sunbeams grew bright once more, for through the darkness the flames were rising higher and higher until the whole city was one vast sea of flame—a mighty funeral pyre for the heroic dead. When the sun rose the next day there were no towers to greet him and reflect his light; neither was there any blood. There was only a heap of burning, smouldering ruins—the city and the people lay dead together.

This scene of horror in the complicated drama of French history was the opening of that memorable crusade against the homes of the Troubadours at the beginning of the thirteenth century. The opening scene of a tragedy which extended through four centuries of time, in which the actors were nations uttering the decrees of fate. A tragedy which comprehended the destruction of a language, a literature, and a people; which united one nation upon the ashes of another; which witnessed the partial decay of the most powerful despotism ever held upon earth; and which ended, as it had begun, in the pitiless destruction of human life. The scene of this terrific movement is comprehended in the present provinces of Languedoc and Provence.

By a mystic chain of cause and effect, each found itself an independent province in the latter half of the eleventh century—Languedoc governed by a native count at Toulouse; Provence falling under the dominion of the Count of Barcelona. For a century or more previous to this, while other nations were being overrun by invaders, and Northern France was in constant turmoil, this portion of the continent, buying the privilege at the expense of a brilliant historical record, was quietly developing a language and a commerce—the one to form a literature, gay, beautiful; the other to generate wealth, luxury, and refinement. But with the elevation of the Count of Barcelona to the throne of Provence, a new element was introduced into Provençal life. Years before a Saracenic flood had swept westward, and in its ebb had left traces of its presence upon the heights of Granada. The poetry and imagination of the East found congenial soil in the valleys of sunny Spain. A new political and social fabric was reared in emulation of the great Eastern nation. Cities of wealth and refinement, with palaces whose ruins excite the admiration of every nation, grand by day in the symmetry and massive structure of their buildings, and brilliant at night with lighted streets, gave evidence of a refined and cultured people when London was the center of an incipient civilization, and when the visitor "sank ankle deep in the mire of Paris." Granada, Seville, Toledo, Cordova—this was the brilliant galaxy of wealth and learning. Poetry, history, philosophy, science—all these were familiar studies. The mercantile portion of the populace had control of the Mediterranean, and their vessels there rode at anchor in every harbor. Great freedom of thought was tolerated; and religion was regarded of less moment than knowledge. Woman was recognized as a tender creature, created for pleasure, and not to be disturbed by the cares of life. A class arose who wandered from court to court relating their tales of magic; and the love for poetic disputation grew strong in society. Beyond the Pyrenees they bore a different character. They were of Gothic descent, rude and untainted with the vices of luxury. They belonged to a race who lived in tents and whose king traveled in an ox-cart. A people, unimaginative, bold, and warlike, reverencing woman as a nobler being. Between these two classes of society adventurers were passing through many decades. The people of the North were modified. They possessed a musical language. The imagination of the South passed above the Pyrenees and ultimately crystallized into the poetry of the Troubadours. The union of Northern sentiment with Southern opinion gave birth to the principle of chivalry. The wandering story-teller of the South became the minstrel of the North. Freedom of thought and speech passed over the line. A commercial taste was developed. Every city became a seat of learning, wealth, and gallantry. The presence of the Count of Barcelona with his Spanish retainers in Provence gave a new impetus to the movement. With a genial sky and fertile soil, the country grew in wealth till every court reveled in luxury, and poverty was unknown. The court of Toulouse became the wealthiest on the continent. Then the search for refined pleasure began. With no religious anchor, laxity of morals began to prevail. This was the period when the Troubadours were in the zenith of their fame. Every castle echoed to their songs; and days were made merry by gay tourneys. The infection spread. The king of England caught the spirit of song; Italian knights reflected the gayeties of Provençal life; and

Germany lighted up with a faint glow of chivalrous imagination. The name of the Troubadour was heard over Europe; and the language of Southern France became suddenly famous. Thus was the foundation of modern literature laid throughout the continent.

Rhyme had been invented below the Pyrenees. Like everything else it traveled northward. Would it not have been well if it could have stopped there and died with the people whose life it resembled? It was a mechanical art, designed to please the ear and tickle the fancy. The Troubadours were in search of pleasure; they found it in the beautiful and musical sound of the rhythm. Like music it appealed to the sensibilities. Sismondi must have caught its spirit when he said: "It was not the ideas alone which gave delight when the Troubadour adapted his beautiful language to the melodious tunes of his harp; when inspired by valor he uttered his bold, nervous, and resounding rhymes; or in tender and voluptuous strains expressed the vehemence of his love."

The Troubadours cultivated no acquaintance with the classic poets. This fact is easily referable to the prejudice of the Arabians against them. Hence we find in Provençal literature no reference to the myths of ancient story—a source of beauty and sublimity to poets of later days. They relied wholly upon themselves; and while this was favorable to the development of individuality, it was narrowing in its tendencies. Their themes were of love and war, though frequently made a vehicle for satirical reflections upon the clergy and Church. Owing to this peculiar restriction, their poems abound in repetitions and strange conceits. They treated of love as they understood it; therefore their poems frequently inculcated principles of disgusting immorality.

There is no towering genius in Provençal literature. Some wrote more voluminously than others; but this does not make a poet great. Amand de Marveil sang his love for the Countess of Bezières in the easy flow of Troubadour sentiment. "They tell me that the heart is only touched by the intervention of the eyes. But I, though I see not the object of my passion, am but the more deeply sensible of the loss I have sustained. They may bear her from my presence, but they can never untie the knot which attaches my heart to hers—that heart so tender and so constant. God alone divides with her, and the portion which God possesses, He holds as a part of her domain, *if God could be a vassal and hold a fief*. Happy scenes in which she dwells; when shall I be permitted to revisit you? A herdsman from thence would be noble in my eyes! Oh that I inhabited a desert, were she but with me! That desert should then be my paradise!"

This was a day when the ladies could reply to the verses addressed them by their lovers. Beatrix of Savoy courted the muse in other than amorous strains, and her poem, from which the following extract is taken, is classed among the war songs of the Troubadours:

"I tell you that nothing my soul can cheer,
Or banqueting or reposing,
Like the onset cry of 'Charge them,' rung
From each side as in battle closing.
When the horses neigh,
And the call to aid is echoing loud,
And there on the earth, the lowly and proud
In the pass together lie;
And yonder is piled the mingled heap
Of the brave that scaled the trench's steep."

Of all the varieties of Provençal song, the satirical poems possess the greatest historical interest. Among this class of writers Pierre Cardinal, who flourished near the beginning of the Albigensian crusade, holds important rank. Speaking of the priesthood he said: "Indulgencies and pardons, God and the devil, are all put in requisition. Upon these they bestow paradise by their pardons; others they condemn to perdition by their excommunications. They inflict blows which can not be parried; and no one is so skillful in imposition that they can not impose on him. There are no crimes for which the monks can not give absolution. For money they grant to renegades and usurers that sepulture which they deny to the poor, because they are unable to pay for it. To live pleasantly, to buy good fish, the whitest bread, and the finest wine—this is their object the whole year round. God willing, I would be of this order, if I could purchase my salvation at this

price." This literature was gay and careless, doomed to decay because of its conceited self-reliance, unless some commanding intellect—some Tasso or Milton—who, by the superiority of his genius, should burst the narrow limitations of Provençal verse, create a new mythology, copy the sublimity of nature, and immortalize the superstitions and impulses of men as he observed them.

Their religion was intimately connected with their social life, as seen in their literature. They were a careless people, caring more for poetry and pleasure than for any particular creed; but they hated Romanism with a radical hatred. They were disgusted with its jugglery and trickery. Their faith, if they had any, was a modification of Manicheism. This belief had prevailed in Armenia in early times, and with the Saracens had been introduced into Spain. Whatever it may have been in principle, it was infinitely less demoralizing than the precepts of the dominant Church. Michelet, the French historian, believes that in Toulouse there was a church of the new faith with its council, priests, and pope. Be it true or false, the understanding was evidently beginning to assert itself and the domain of Romanism to be threatened. When Pope Innocent III. was seated in the pontifical chair, he found himself wielding a scepter over Europe, with the sovereigns of the nations holding their domains in feudal tenure to him. This was a legitimate result of the crusades. When he cast a complacent glance over the continent, and rested his eye upon this happy people of Southern France, enjoying wealth and freedom, ridiculing the Church of Rome in their national songs, and worshiping the Deity in their own way, the jealous pang which went to his heart was abundant reason for passing death-sentence upon them. Inquisitors were dispatched thither. They excommunicated to no effect. One missionary made himself so obnoxious that he was killed. The pope was exasperated. The faint glow of intellect, reflected from the midst of nations submerged in Romish darkness, must be extinguished in blood. One effect of the crusades had been to reveal Southern Europe to the North. The northern portion of the continent blindly followed the pope. They hated the East and everything which bore an Eastern impress; therefore they hated the South. They were aroused by the impiety of the Troubadours. They despised commerce and looked upon the South as an emasculated people. When, therefore, Innocent preached a crusade against Southern Manicheism, the fanaticism of the North, yielding to no mercy, but thirsting for the blood of heretics, rushed from every quarter to a common center; and when he proclaimed universal indulgence and pardon to every crusader, there swarmed from every city, from every nation, the vilest portion of humanity. They came with hands reeking in the blood of murdered victims, with minds disordered by the remembrance of inhuman atrocities and defiled with the most disgusting crimes which the foul imagination of fallen humanity could suggest, and swelled the fanatic host to hundreds of thousands. Thus they swept down upon the peaceful Languedocians, rendered effeminate by refinement and culture, but possessed of courage greatly disproportionate to their prowess. Then followed scenes of slaughter and inhumanity which sickened the heart in imagination. "For twenty years nothing was known but massacres and tortures. Religion was overthrown, knowledge extinguished, and humanity trodden under foot."* The crusades were led by a man who must remain an object of detestation throughout all ages—Simon de Montfort. A man with no courage, no judgment, no self-reliance. Ferocious, brutal, perfidious, despicable in every respect. This inhuman wretch, styled by the pope "The active and dexterous soldier of Jesus Christ, and the invincible defender of the faith," who could stand composedly by while heroes were dying under the most excruciating agonies in defense of their faith—this man could so far forget his invincibility and dexterity as to jump from a two-story window and sneak out of the city, like a booted dog, because a mob was railing against him. This crusade, though nominally terminating when the "foul heresy,"

* Sismondi.

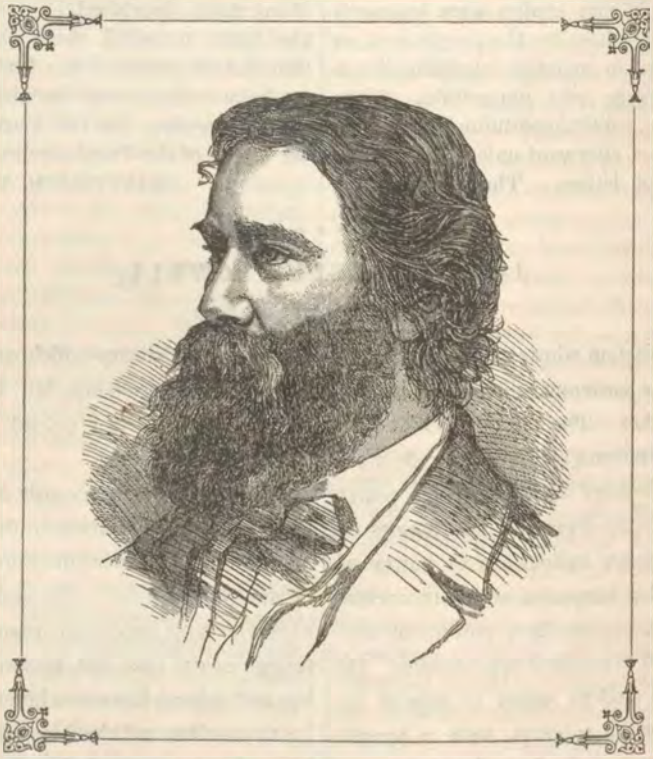
as an organization, was broken up, and its defenders scattered or put to the sword, still lived in principle and burst forth in occasional persecutions until the beginning of the seventeenth century, when the Camisards were destroyed — an event which marks the death grapple of that principle first manifested on the morning of the storming of Bezières with the progress of free thought in France. The effects of this war were manifold. That which impresses us most is the destruction of the Provençal language and literature. While the war was raging, literary studies were impracticable; and at a later day the people were so scattered that to maintain anything like a perfect language was impossible. More than that, the political condition of that part of France was afterward unfavorable to the cultivation of letters. The language of Provence had spread over Europe, it is true, and had acquired the reputation of the most perfect and musical on the continent; but when it ceased to be cultivated on its native soil, and, as Sismondi observes, became the language of funeral lamentation, it would have been unwise to expect it to be long retained at foreign courts. There was but one exception. Many of the Troubadours found refuge with the king of Arragon, who had been their ally against the Church. In that kingdom the Provençal language was retained and its literature cultivated. Many poets flourished, but never achieved the fame accorded their elder brothers. Still their poems possess a fascinating interest because they recall the memory of happier days—they are the inscriptions upon the tombs of the Troubadours.

GRANVILLE M. TEMPLETON.

JAMES RUSSELL LOWELL,

POET AND AMBASSADOR.

AN organization whose salient characteristic is harmony, distinguishes this eminent author. The face, in its outline, evinces the student given to calm reflection, the earnest inquirer who pursues his course quietly and apart from the busy haunts of men. There are indications of power of memory and of language, ability to analyze and criticise, and excellent powers of construction and of æsthetic appreciation. He is a natural student, eager to acquire information on all subjects, with a special inclination, as we infer from the contour of the forehead, for those which embody philosophical ideas.



The nose indicates symmetry of development and a high order of refinement; at the same time it shows no little force and spirit as an element underlying or supplementing his quiet routine. He appreciates reputation and the favor of society highly, but is not the man to subordinate himself to others for the sake of their approbation. He has that delicacy which avoids conflict and open disagreements, but, when conflict is necessary, he can defend himself with vigor and good effect.

The appointment recently of Mr. Lowell as United States Minister to Spain is generally deemed a discreet measure on the part of our Government. The eminent literary men who have heretofore represented us in foreign courts (like Mr. Bancroft, Mr. Motley, and others) have won honor and esteem for themselves and the American name, and have shown that scholarship was by no means inconsistent with diplomatic capability.

James Russell Lowell was born at Cambridge, Massachusetts, on the 22d of February, 1819. His ancestor, Percival Lowell, was among the early colonists of New England, having emigrated from Bristol, England, in 1639, and settled in Newbury, Massachusetts.

Among the descendants of Percival were

many who held important relations, political and social, to the State. Charles Lowell, father of the poet, was an eminent clergyman. For fifty-six years he was pastor of one of the principal churches in Boston. James, the youngest of several children, was named for a great-grandfather, eminent as a judge. His boyhood was passed amid pleasant home and school associations. Cambridge fifty years ago was a rural village, embowered in trees and surrounded by flowery pastures, orchards, and woods. Now it is a city with upward of 50,000 inhabitants, in which the old simplicity is wanting. Lowell graduated in Harvard in 1838, then commenced the study of law, entered the Cambridge Law School, and was promoted to the bar of Boston in 1840.

In college he was noted for his wit and excellent conversational talent more than for a disposition to close study. He was a poet while a student, and was appointed to recite the class-poem in his last college year. After admission to the bar he opened a law office in Boston, not because he entertained any special fondness for the profession, but rather to please his father. A brief experience convinced him that he was ill-adapted to that vocation, and he abandoned it, devoting himself to literature. He wrote for the *Boston Miscellany*, a monthly magazine of high character.

In 1841 he published his first volume of poems, entitled "A Year's Life." In January, 1843, he commenced, in association with Robert Carter, the publication of *The Pioneer*, at Boston. Three numbers were issued, when it was discontinued, owing to the pecuniary failure of the project. Mr. Lowell ventured another volume of poems in 1844, through Mr. John Owen, the University bookseller of Cambridge. This volume contained a "Legend of Brittany," "Prometheus," "Rhaecus," and other pieces. This met with good success, and was reprinted in London.

The next year he issued a volume of prose, entitled "Conversations on Some of the

Old Poets." In 1848 he published a new collection of poems, together with "The Vision of Sir Launfal," which is, perhaps, one of the best, as it has been the most popular of his productions. During the Mexican war, 1847, he contributed a series of satirical poems, in the Yankee dialect, to the *Boston Courier*. They were fathered by one "Hosea Biglow." Subsequently, these and other like contributions were collected in one volume under the title of "The Biglow Papers." In 1848 the "Fable for Critics," an ingenious rhymed essay upon principal living American authors, appeared anonymously.

In 1852–'53 he visited Europe and resided some time in Italy. In 1855, on the resignation of Mr. Longfellow, he was appointed Professor of Modern Languages and Belles-Lettres in Harvard College. He then went again to Europe to perfect himself in his studies, which were prosecuted chiefly in Dresden, and returned and assumed his duties in the following year.

When the *Atlantic Monthly* was started in 1857, Mr. Lowell was selected as editor-in-chief, a position which he held for some years. Afterward he was, for several years, editor of the *North American Review*. His "Fireside Travels" was published in 1864; "Among My Books," 1870, and "My Study Windows," 1871, were made up of essays written for periodicals. In 1869 a volume of his poems, with the title "Under the Willows," appeared. In the same year was published "The Cathedral." After a second residence of two years in Europe, he returned home in 1874 to resume literary work with his wonted industry and enthusiasm.

During this visit, the degree of LL.D. was conferred upon him by the English University of Cambridge. Toward the close of 1874, President Grant tendered him the Mission to Russia, but it was declined, and George H. Boker, of Philadelphia, was appointed.

Mr. Lowell is a man of middle stature, of impressive and handsome appearance, with an organization which is marked for its special adaptation to literary pursuits. As a writer of verse no American poet has surpassed him in elevated and philosophic thought, or in accurate delineations of nature. As a prose writer he is vigorous, eloquent, clear, and critical, exhibiting a very broad range of peculiar and curious reading.

Upon receiving his recent appointment, Mr. Lowell resigned his Harvard professorship; but the Faculty decided to fill the chair temporarily, and refused to accept his resignation.

On his departure from Boston on the 16th of July, the poet was accompanied down the harbor by a party of 200 ladies and gentlemen, including many of Mr. Lowell's friends and associates in Cambridge, among them the well-known Emerson, Longfellow, Dr. Holmes, President Elliot, and Professors Lovering, Dunbar, and Pierce, of Harvard. There were also on board Hon. osiah Quincy, Colonels Hutchings, Rice, and Campbell, Rev. Mr. Savage, and others.

The friends gathered in the captain's cabin, where Dr. Holmes read a poem he had prepared for the occasion; and brief remarks, expressive of warm esteem for the new ambassador, were made by others.

In speaking of his characteristics, a writer says: "He does not write at a table, but seating himself midway between it and the fire-place in a broad easy-chair, he uses a stiff piece of pasteboard, resting it conveniently on his knee. His 'copy' is unpopular with printers for its many changes, erasures, and interlineations, though the writing itself is fair and uniform. He is a hard reader and student, and his classical knowledge is not excelled by that of any of the Harvard professors. He is quite a pedestrian, an angler, and a worker among his flowers, and, though not a rich man, has an income sufficient to enable him to be independent in authorship."

No one can follow the good who does not love it; no one can successfully avoid evil who does not hate it. The heart will overmaster mere resolutions and will betray one. If a citadel is to be kept it will not do to have inside one whose fingers are constantly itching to undo the gate and let the enemy in. Therefore, "hate the evil and love the good."

THE NEZ PERCÉS.

THE Indian troubles in Idaho have developed results which are almost parallel to the painful incidents of the Black Hills operations a year or so ago. The newspapers have given voluminous reports of certain operations on the part of the American forces against a redoubtable tribe, or a part of it, known by the name Nez Percés. The leader of the belligerent savages, generally known by the name of Joseph, has exhibited a wonderful degree of skill in avoiding and offsetting the maneuvers of our most experienced officers. In the early part of July a conflict occurred near the mouth of the Cotton Wood in

which Captain Joseph, at the head of less than a hundred braves, made a determined stand against a large force of regular troops, and impressed the American officers that they had another Captain Jack to deal with. A week later the Indians' camp was destroyed and the subjects driven across the river toward the mountains. But later, after we had been informed that Joseph and his band were pent up and disposed to make terms, a battle took place, in which the Government forces were sadly worsted. Terrible massacres of white settlers near Salmon River by these Nez Percés and other serious occasions are assigned as the immediate causes of the efforts of the Government to inflict a thorough castigation on the Indians who have been guilty of such outrages.

The fact is too much lost sight of in these Indian troubles that their rights are disregarded by settlers and frontiersmen; that solemn treaties or promises are neglected or ignored by the whites almost as soon as made. The Indian leader who has become familiar to us is not the real chief of the Nez Percés, but a strong, energetic fellow, who has gathered a band of warriors. They insist that their country has been invaded and occupied contrary to every principle of justice and law. It is claimed, however, on the part of the Government that Joseph's father, in connection with other Indian chiefs, released their rights upon the lands which are the theater of conflict, and that, therefore, his persistent occupation of them is against the rightful claims of the whites. The field of hostilities lies west of the Rocky Mountains near where the Salmon River joins the Snake. A part of it is a high plateau stretching between the Bitter Root Mountains and the Cascade range, a region in great part a desert, and not inviting, one would think, for white settlement.

The Nez Percés Indians possess features of special interest, from the fact that they are recognized as superior to most of the other Indian tribes of the Pacific coast. The name Nez Percés, which signifies pierced noses, was given them by the French of Canada, probably from an ancient custom of piercing or cutting the septum of the nose, which they do not now practice. The Indians call themselves Numepos, and belong to the Sahaptin family, which in its turn is related to the Chinooks, who live in their neighborhood.

The custom of head-flattening has been more or less practiced in some of the tribes of the Sahaptins as with the Chinooks. It is said, however, that the Sahaptins have not carried the practice of compressing the head so far as the tribes near the coast, they merely aiming to make the forehead more retreating, and this with the aquiline nose common to the natives gives them occasionally a physiognomy similar to that represented in the

hieroglyphic paintings of Central America. ("Pale's Ethnology.")

The observer finds that the inland tribes west of the Rocky Mountains possess a higher order of face than the coast tribes. The cheek bones are still high, the forehead is rather low, the face long, the eyes black, rarely oblique; nose prominent, frequently aquiline; lips thin, the teeth white and regular, the general expression of the features stern, often melancholy, but not, as a rule, harsh or repulsive; and dignified, fine-looking men, handsome young women are found among them; the complexion is not darker than on the coast, but is more of a copper hue; the hair is black, coarse, and worn long; the beard is very thin, its growth carefully prevented by plucking. Townsend in his Narrative states that the Nez Percés "are almost universally fine-looking, robust men, with strong aquiline features; a much more cheerful cast of countenance than is general among the race of the Sahaptins. Some of their women might also be called beautiful. None that I have seen are homely. While the Chinooks are generally of low stature, the Nez Percés are generally tall, athletic men, bordering on six feet in height." The engraving is a portrait of Quak-hum, the real Chief of these people.

The inland tribes appear to have less propensity to adorn themselves with painting than the Indians east of the mountains; but they not unfrequently mix red clay with vermilion, which is applied, as a rule, only to the face and hair. In their domestic arrangement, the style of dwelling and dress, they show decided superiority over both the Indians east of the mountains and those of the Pacific coast.

Although known as "rovers," the Numepos build themselves comfortable log shanties, and have fenced cornfields. After the planting season, they start off with their tepes, or skin tents, and lead a roving life until winter drives them back into their huts.

In contrast with the habits of the Chinooks, the Sahaptin house is kept free from vermin and filth. In his allusions to the Columbian and other tribes of the far northwest, Mr. Bancroft distinguishes between flat-heads and Nez Percés as if the latter were not to be properly reckoned among flat-head tribes. That the Nez Percés have lately shown a good degree of military ability is only too well known to our regulars, but authorities are generally agreed in ascribing to this tribe peaceful habits. Ross in his "Fur Hunters" states that they do not follow war as a profession, and can not be called a warlike race. They show skill in preserving and cooking their food, and while most of the Indian tribes surrender to the women the duties of digging for roots, picking berries, and other labors of the household, the Nez Percés men divide, to some extent, those labors. It is worth mentioning that their marital relations are rigid, and immorality, as it prevails to so unhappy an extent among the civilized, is almost unknown.

At Fort Wal-lu-la is the station where twenty years ago these people defended the Presbyterian missionaries from the attacks of other Indians.

AN IMPROMPTU.

It happened once, in Nature's wildest nook,
A little birdling fluttered from its nest
With thought intent to fly o'er vale and brook,
And give its love of life a better test.

It raised its timid wings for higher flight;
Then soon a swift, uncertain, canny note
(That strangely trembled on the breezy height),
Poured forth from that uncultured little throat.

The song then floated out and reached the ears
Of greater birds, who answered, on the wing:
"Oh, foolish birdling, hush; your youthful years
Should shame your bold attempt to fly and sing!"

It heard, abashed, then looking sadly grave,
As if its tiny heart were sorely tried,
One other feeble little note it gave,
Then slowly fluttered down, and quickly died.

. . . . . .

Oh, blame it not, nor call it foolish thing;
Nor say it never should have left the nest.
God knows why it was led to fly and sing,
And He'll reward it up among the blest.

E. MILES.

INSTINCT.

" Brutes find out where their talents lie ;
A bear will not attempt to fly;
A founder'd horse will oft debate,
Before he tries a five-barr'd gate."

THERE is, in the instructions we derive from examining the three great kingdoms of Nature, a trilogy which answers to the three-fold expression of life, and is largely realized when we turn our attention to the contemplation of reason, a true idea of whose forces is impossible until that instruction be listened to and applied. Mr. Griddon, that distinguished writer, gives three expressions of life, and, consequently, three great classes of vital phenomena. Those of the lowest degree of life, or the life of inorganic nature, are the domain of Chemistry and Physics ; those of the physiological, or organic expression, constitute the Instincts ; those of the spiritual degree, disclose Reason. The first, then, are identified with the mineral world ; the second with plants and animals, including the material body of man, and his temporal and terrestrial nature ; the third pertain peculiarly to himself, since he alone is concerned with the immortal and celestial. Each degree of life prefigures the next above ; chemical phenomena prefigure instinct, and instinct beautifully prefigures reason ; but like minerals, plants, and animals, which are their pictures, they are totally, absolutely, and persistently distinct, because between each there is a barrier of a discreet degree. Never, therefore, was there a greater mistake than that of Helvetius, Condillac, Smillie, and those other distinguished writers who contend that reason is no more than the *maximum* development of instinct ; in plain English, that reason means more instinct and instinct less reason. This is virtually to deny that there is any difference between man and brute, and thus to pronounce them both imperfect. There is not the least shadow of doubt but that the doctrine arose from the false notion of a continuous chain of being.

The full meaning of instinct is more than the performance of certain ingenious works, cognizable by our senses. Neither does it consist simply in those actions and trains of actions to which books on the subject of instinct ordinarily confine themselves—such as the nest-building of birds, and the hunting, by the new-born infant, for the mother's breast. For technical purposes, it may be policy to so restrict the term ; but, reviewed philosophically, instinct is co-ordinate and co-extensive with life itself. The actions, commonly called instinctive, are exhibitions, in a wider form, of the very same formative energy which previously molds the various organs of the body and maintains them in their functional activity. This is strikingly illustrated in the constructive instincts, such as impel the fabrications of coverings, clothing, and dwellings, all of which are a kind of ultimated and externalized organization. This instinct of which we speak is the general faculty of the entire living fabric, underlying and determining all activities which transpire, either invisibly in the organs themselves or as played forth to observation ; thus bearing exactly the same relation to the general structure which the constructive chemical forces bear to the crystal.

As a final summing up, instinct may be defined as the operation of Life ; it matters not whether promoting the health, the preservation, or the reproduction of an organized frame, or any part of such frame, and whether animal or vegetable. "The law of instinct," says the illustrious Mason Good, "is the law of living principle ; instinctive actions are the actions of the living principle, pervading and regulating organized matter, as gravitation pervades and regulates *un*organized matter, and uniformly operating, by definite means, to the general welfare of the human system, or the separate organs thereof, advancing them to perfection, preserving them in it, or laying a foundation for their reproduction, as the nature of the case may require. Its application is general, and is the same as regards plants as animals, and to every part of one as to every part of the other, so long as such part continues alive." *

* See " Book of Nature," Vol. II., page 80.

Virey uses similar terms: "Internal impulses of life constitute acts of instinct in plants the same as in animals."

We distinguish, therefore, two degrees of instinct: First, that of the interior functions, or of the mechanism or organization; secondly, that of the spontaneous outward impulses. Carus, also, when he calls upon us to observe how a plant "through internal instinct, and under external relations, unfolds itself from an obscure and insignificant end." Dr. Laycock, too, the eminent physiologist, writes to the same effect when he says: "Inherent in the primordial cell of every organism, whether it be animal or vegetable, and in all the tissues which are developed out of it, there is an intelligent power or agent, which, acting in all cases independently of the conscioùsness of the organism, and whether the latter be endowed with consciousness or not, forms matter into machines and machinery of the most singular complexity, with the most exquisite skill, and of wondrous beauty, for a fixed, manifest, and predetermined object: namely, the preservation and welfare of the individual, and the continuance of the species. This *quasi*-intelligent agent works with an apparently perfect knowledge of number, geometry, mathematics, and of the properties of matter as known to the human intellect under the term 'natural philosophy' or physics—that is to say, with a perfect knowledge of chemistry, electricity, magnetism, mechanics, hydraulics, optics, acoustics—but as far transcending the limited knowledge of the human intellect as the structure and adaptations of living organisms exceed in beauty and fitness the most finished works of man."

Between the work of simple vitality, or vital power, as it is customary to call it, and the externalized operations popularly understood by the term "Instinctive," there is thus no real difference but that of method and proximate object. It is the same force which first clothes the bird with plumage and then impels it to build its nest and line it with feathers.

J. F. ELSOM.

FACTS AND A REASON.—The newspapers say: "In that part of the Black Forest belonging to the grand duchy of Baden lies the petty district of Koenigsfeld, containing 410 inhabitants. During fifty years there have been in it no crimes or misdemeanors of any sort—neither transgressions of the police regulations, nor sheriff's sales, nor illegitimate births, nor divorces, nor lawsuits of any kind. Moreover, in these last fifty years at Koenigsfeld no one has ever got drunk or stretched out a hand to beg."

Does not the last sentence account for what is stated previously?

RELATIVE GROWTH OF BOYS AND GIRLS.—The following is a summary of results obtained by Dr. H. P. Bowditch, who examined 24,500 pupils in the Boston schools, public and private: He finds that up to the age of eleven or twelve, boys (of several races) are taller and heavier than girls, while for the next two or three years the tables are turned, the girls nearly completing their full growth, and after that the boys regain their ascendency; that at heights below 58 inches the boys are heavier than girls in proportion to their stature, while at heights above, the reverse is the case; that the children of American-born parents are taller and heavier than the children of foreign-born parents; that the pupils of American parentage, of certain private schools, surpass in these particulars the public school pupils, as well as English boys of about the same social grade. "It will thus be seen," says Dr. Bowditch, "that the theory of the gradual physical degeneration of the Anglo-Saxon race in America derives no support from this investigation." Our friend Dr. Nathan Allen's studies of vital statistics, based on the annual reports of births, deaths, and marriages in Massachusetts and Rhode Island, have established the fact that the fecundity of American women in these States is relatively much less than that of the foreign-born women in the same localities. We must thank Dr. Bowditch for showing that our Anglo-Saxon children are superior in quality, though relatively inferior in numbers, to the children born of foreign parents.

It is only by training all together—the physical, intellectual, and spiritual elements—that the complete man can be formed.

TEMPERANCE.

DR. B. FRANKLIN'S definition of temperance is: "Drink not to elevation; eat not to dullness." Properly speaking, temperance means moderation, not abstinence. Formerly in respect to alcoholic liquors this was considered the true idea of temperance. Modern temperance means abstinence from alcoholic drinks as a beverage. But there is a class of persons who maintain that the old idea of temperance is the correct one, and others claim that alcohol has no remedial or dietetic properties. Which of these have the truth? No two of them can be true. If one is true, the other two are false. They are incompatible with each other.

If the temperate use of alcoholic drinks as a beverage is good, then its abuse is no argument against its use. If it is an evil as a beverage, and a good as a medicine, then its use is limited to sick persons. If as a beverage and as a medicine it is an evil, then all use is abuse. Admitting the premises, no one can gainsay the conclusion in any one of the above cases. Now let us examine these incompatible positions and endeavor to ascertain which is the true one.

I. It has been urged that the moderate use of alcohol is "the golden mean between the two extremes," and that the major part of the intemperance of modern times is due to the immoderate use of these beverages. It is also said that in former times these liquors were of better quality than the ones now so generally used, and that much of the evil that is attributed to the use of these beverages is really due to their adulteration and not to the alcohol they contain. These arguments are apparently plausible. Immoderation is no argument against moderation. The ill effects of adulterated articles are not arguments against the use of the genuine. But prior to the acceptance of this view of the subject as conclusive, the primary question should be considered and decided.

This question is: Is alcohol an aliment or a poison? If reliance is to be placed on the authorities, there is no hope of obtaining a conclusive decision upon this subject. Many high authorities are found on both sides of this question. There is some weight and force in arguments drawn from the opinions of men of distinction, but they can never be regarded as conclusive.

But if we look to Science—the interpreter of Nature—there will be no great difficulty in obtaining a correct solution of this vexed question. Science teaches, and that truly, that plants are the sole producers of nourishment, and this by the processes of growth and development. Alcohol is not produced in this way; hence alcohol is not an aliment. Alcohol is a product of decomposition or decay, which is not a food-forming, but a food-destroying process.

Again, What are the effects of alcohol when taken into the body? Dr. B. W. Richardson, a distinguished observer, says: "The well-proven fact that alcohol, when taken into the body, reduces the animal temperature, is full of the most important suggestions. It shows that alcohol does not in any sense act as a supplier of vital heat, as is commonly supposed, and that it does not prevent the loss of heat as those imagine 'who take just a drop to keep out the cold.' It shows, on the contrary, that cold and alcohol in their effects on the body run closely together, an opinion most fully

confirmed by the experience of those who live or travel in cold regions of the earth.

"On the muscular force the very slightest excess of alcoholic influence is injurious. I find, by measuring the power of muscle for contraction in the natural state and under alcohol, that so soon as there is a distinct indication of muscular disturbance, there is also indication of muscular failure; and if I wished by scientific experiment to spoil for work the most perfect specimen of a working animal, say a horse, without inflicting mechanical injury, I could choose no better agent for the purpose of the experiment than alcohol. But, alas! the readiness with which strong, well-built men slip into general paralysis under the continued influence of this false support, attests how unnecessary it were to put a lower animal to the proof of an experiment. The experiment is a custom and man is the subject."

Any substance taken into the primæ viæ, or digestive apparatus, that reduces the animal temperature and produces muscular failure, as has been well-proven that alcohol does, is surely not beneficial, but only injurious to the healthy organism in which it is introduced. Truly, poisons are those materials that are rejected from the vital domain, and foods are those substances that are usable in the construction and replenishment of the bodily organs. Alcohol is a non-usable thing, as has been proven; a substance which the living system is obliged to resist and expel. The depression, want of muscular power, and disordered condition of the living system, as results of the use of alcohol, are the signs of overworked organs engaged in the disposition of this poison.

Dr. Markham, of the *British Medical Journal*, says: "None of it (alcohol) so far as we know, is assimilated or serves the purposes of nutrition. It is therefore not food in the eye of science."

According to my judgment the above facts conclusively prove that alcohol is neither an aliment nor a wholesome drink, and that its relation to animated life is an abnormal one. Hence moderation in that which is injurious, *per se*, is not good, but is an evil. With this view of the subject there can be no utility in the temperate or moderate use of alcoholic beverages. It is all evil; the good consists in abstinence. Instead of temperance societies let us have abstinence societies.

II. The modern view of temperance indorses alcoholic medication. This brings us to the consideration of the subject of stimulation. Most medical authors and teachers define stimulation to be an exaltation of organic action; an elevation of the powers of the economy to the normal standard. Stimulants do surely produce an exaltation of vital action; and also an elevation or augmentation of the action of the organs of the economy; but how such exaltation and elevation tend to establish a normal condition of things, is not so easy to perceive. If life is a forced state, as was claimed by Dr. Brown long ago, then this view is correct. But no one in these days claims or believes life to be a forced state. It is a conditional state dependent upon fixed relations or laws. This definition is too apparent to need any illustration or demonstration. All stimulation is a goading or whipping of the vital organs into action. Alcohol is a poison—a non-usable thing. Hence vital action produced by alcohol is one of resistance.

It is asserted that alcohol is an antidote to the poison in the system in typhoid and typhus fevers. Surely no one knows the exact character of "typhoid" poison as it is called, therefore upon what grounds is its use predicated? It is merely tentative or experimental. There is ample testimony that has been given to the public by honest and candid observers that favors the non-utility of alcohol as an antidote or in any form as an adjuvant in the treatment of said maladies. Several physicians have told me that their typhoid patients did better without these stimulants. I recall several cases that came under my own observation that were treated without alcohol in any form, and their recovery was not followed by any of the sequels that so generally follow this disorder, while some others in the same vicinity who were treated in the ordinary way, did not survive and the remnant that received like treatment had a linger-

ing convalesence. If our view of stimulation is correct, where is the philosophy and reason that indicates the use of alcohol in diseased and debilitated conditions of body?

On this point Dr. B. W. Richardson says: "When it is physiologically understood that what is called stimulation or excitement is, in absolute fact, a relaxation, I had nearly said a paralysis of one of the most important mechanisms in the animal body, the minute resisting, compensating circulation—we grasp the error in respect to the action of stimulants, in which we have been educated, and obtain a clear solution of the well-known experience that all excitement, all passion, leaves, after its departure, lowness of heart, depression of mind, and sadness of spirit.

"It is assumed by most persons that alcohol gives strength, and we hear feeble persons saying daily that they are being kept up by stimulants. This means actually that they are being kept down; but the sensation they derive from the immediate action of the stimulant deceives them and leads them to attribute lasting good to what, in a large majority of cases, is a persistent evil. The evidence is perfect that alcohol gives no potential power to brain or muscle. During the first stage of its action it may enable a wearied or feeble organism to do brisk work for a short time; it may make the mind briefly brilliant; it may excite muscle to quick action, but it does nothing at its own cost, fills up nothing it has destroyed as it leads to destruction."

Dr. Richardson further says: "There are times in the life of man when the heart is oppressed, when the resistance to its motion is excessive, and when blood flows languidly to the centers of life, nervous and muscular. In these moments alcohol cheers. It lets loose the heart from its oppression, it lets flow a brisker current of blood into the failing organs, it aids nutritive changes, and altogether is of temporary service to man. So far alcohol is good, and if its use could be limited to this action, this one purpose, it would be among the most excellent of the gifts of nature to mankind."

"Consistency, thou art a jewel." But where is the consistency of this writer? He favors the use of alcohol for lowness of heart, failing action of organs, and depression—the very conditions he demonstrated that alcohol produces. Can anything cure or heal that which it causes? Such is the philosophy of the Homeopathic sect. *Similia similibus curantur.* This compromise position has the same foundation in science as the above medical *dictum.*

On this subject Prof. Miller, of Edinburgh, Scotland, says: "Alcohol cures nothing; it covers up a great deal."

Dr. Guthrie, of the same city, said: "If you want to keep a dead man, put him in whisky; if you want to kill a living man, put the whisky into him."

Dr. Beaumont, of Bradford, England, says: "That its (alcohol's) apparent 'support' is nothing more nor less than fever produced by the poison, which, instead of sustaining the patient, only prostrates him the more."

These quotations show that a portion of the medical fraternity appreciate this absurdity of trying to discriminate between alcohol as a beverage and alcohol as a medicine. In the face of these admissions and facts it is reasonable to infer that alcohol is not good for the well nor for the sick. Alcohol as an antiseptic and in the chemist's laboratory is surely a substance of much value. Its use is outside of the living organism.

III. Lastly, the ultra or radical view is the truly scientific position of alcohol.

This subject has several legal positions, that have their respective supporters as well as those we have cursorily considered. Much has been said in regard to license and prohibition laws. One faction argue that prohibition is the proper legal position. Another claims that the liquor business should be allowed or prohibited in any community as the majority of the citizens of said community may direct. Still another claims that this business should be allowed to exist upon the same foundation as any other business, subject to the laws of supply and demand.

Now it is not so very difficult to perceive which is the proper method of procedure in respect to the liquor traffic, from a legal

stand-point, so long as we keep in view the cardinal principles of our Republic. In our government the will of the majority is the law. It matters not whether said will is true or false in the eye of science, it is the law of the land and should be obeyed. Any other course of procedure is subversive of all law and order so long as the present form of government exists. Hence the regulation of the liquor trade depends upon the will of the people. If they say prohibition, then prohibition is the law. If they say this business may exist, provided it complies with certain conditions, such is the law. There is no other mode of procedure to adopt that is compatible with the spirit of our institutions and the principles of our government. If the law is on the false side, then the majority of the people are in the same condition. To change the law we must first change the people—the indirect makers and direct supporters of the law. Old laws remain in force until set aside or superseded by new. Truly, the legal position of alcohol depends upon the will of the people. If their decision is not in harmony with science, it is nevertheless the correct legal position of the liquor business. Legislative enactments have little force or utility when they are not supported by the people.

What is generally taught is generally practiced; so, much of what is true or false in any age is in a great part a mere matter of education. So difficult is it for any one to unlearn what they have at one time learned, or disbelieve what they at one time believed, that few persons depart from the path of their training and education. Hence this notion that alcohol does not give strength and does not support vital heat is so opposed to established usages and in direct antagonism with the general habits, customs, education, and prejudices of the people, that most persons will demand reasons the most profound, and evidences the most conclusive before they can be induced to renounce the teachings of education and the habits of long established customs. All that is necessary or is proper to be done now is to commend these great truths to the thoughts and feelings of our fellow-men in such a manner that they will consider and understand them and then exemplify them in their lives.

In view of all the facts in regard to the alcoholic controversy, both scientific and legal, it is evident that the truth in respect to this subject as well as all other subjects, will be discovered and accepted in proportion to the degree of the intelligence that humanity attains in any age or period of time.

JOHN G. STAIR.

THE TEETH--GROWTH AND PRESERVATION.

THE notion of beauty differs under the different zones and among different nations. The European lady pities the Chinese one for her crippled feet, on which she is only able to walk imperfectly; whereas the Chinese lady of fashion would be amazed at the crippling which our fashionable ladies effect by the use of the corsets. On the banks of the Ganges one colors the nail of the fingers, and a fashion of the Botocudos demands the piercing of the lower lip, as we pierce the ear-lap. Why should we wonder that wild nations consider white teeth ugly, and that they therefore stain them brown or black so as to harmonize them with the color of their body. The Javanese go so far as to cut with a file the incisors and eye-teeth of their youth of fourteen or sixteen years down to the root. Not before this very painful operation has been performed in front of the assembled family, is the Javanese boy considered independent, can appear as witness before the court, or make contracts — in short, by the loss of his teeth he gains in his tribe the citizenship.

"I had," says Dr. Friedman, "a handsome Javanese boy as a servant, who once asked me for a few days leave of absence, as his teeth had to be filed off. I tried to persuade him to save his very nice and white teeth, but in vain; he seemed to rejoice in the idea of the operation just as a young lady rejoices at the prospect of her first entering a *salon* A few days afterward he

returned disfigured, with great gaps, inflamed gums, and an appearance of age."

The teeth among civilized nations are esteemed for the aid which they give in speaking, in the forming of the face, and in

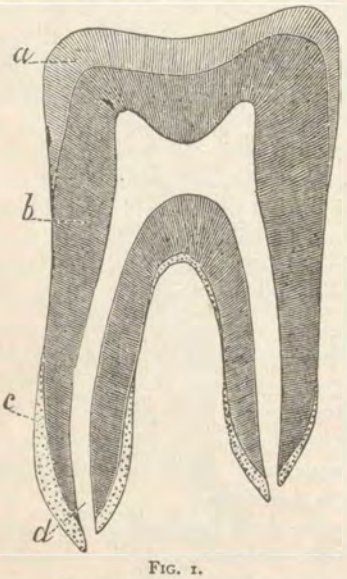


FIG. 1.

the mastication of food; but wild and uncivilized nations use their teeth like animals, as well for weapons as for tools, for defense as well as agents for mechanical labor. When, therefore, a nation relinquishes their brutal uses voluntarily, it steps up to a higher degree of civilization. Perhaps some Javanese Moses or Solon, as a wise lawgiver introduced the heroic custom to which we have referred to civilize his nation; so, what we consider a barbarism may be indeed an expedient of civilization.

The necessity of any part of our body may be measured by the time it takes for development. The more necessary certain limbs are for a child's existence, the quicker they grow themselves. Therefore the brain and the spinal marrow rank first of all parts of the human and animal body in importance of development, just as it is the most important in relation to existence. Next in order of development comes the heart. The first bone which is formed on the skeleton of the child is the lower jaw, because the child needs it for suckling as soon as it is born. The lower jaw contains almost all the teeth, after the birth, which the future man needs. In the cavity of the mouth of a full-grown man we find thirty-two teeth; in the upper as well as in the lower jaw there are four incisors, two corner or canine teeth, and ten molar teeth, of which five are on each side. The incisors have a wide and chisel-like crown; one can easily see that they are for the cutting of the food; their roots are simple, of medium size and of the form of a turnip. The corner or canine teeth have a pyramidal crown; their roots are also simple, but much longer than those of the incisors; from this fact the superstition originated that their roots are in connection with the eye, and that all disease of these teeth is very dangerous for children. Of the molar teeth a distinction is made between the first two on each side with two roots, and the three behind ones with tricloven roots. The last molar tooth, which

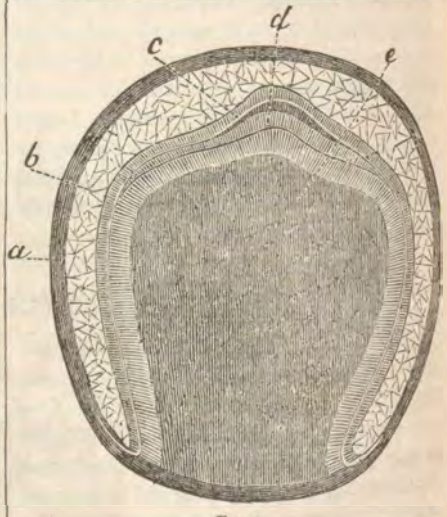

FIG. 2.

Tooth pouch of the second cutting tooth, a month before the birth of the child (magnified 15 times); *a*, the external tooth pouch or sac; *b*, the germ for the enamel; *c*, the already formed enamel; *d*, the already formed toothbone or ivory substance; *e*, the germ for the toothbone.

usually breaks out about the twentieth year, is called the "wisdom" tooth; all molar teeth have a broad, stamp-like crown.

The tooth is composed of different parts. If we cut an incisor or molar tooth horizon-

tally, we find the following form: *a*, uppermost there is a kind of a capping of a hard yellowish white substance—the enamel; *b*, the mass of the tooth, which consists of a white silky-looking substance—the real tooth

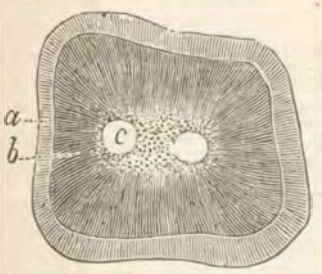

FIG. 3.

substance, or the ivory; in its cavity (wherein the germ of the tooth is located), and externally thereon, is, *c*, a white transparent mass, of a bony-like substance, which is called the cement. All these parts have a different construction. If we examine the enamel through the microscope, we will see that it consists of four, five, and six-sided long threads; these threads are twisted around each other in manifold windings, are broad, and show besides cross-lines. The tooth substance consists of thin, but little twisted, often straight, running tubes, which are round and transparent, and have in a good light a silky brightness. But there is a difference in its chemical construction; the enamel consists of 88 parts of phosphate of lime, 8 parts of carbonate of lime, and 4 parts of animal substance; the tooth substance, on the other hand, has 28 parts of animal matter, only 64 parts of phosphate of lime, and but 5 parts of carbonate of lime. The cement, the bony substance of the tooth, has in part a homogeneous mass, and in part consists of what are called bone corpuscles; this substance contains the most animal matter, namely, 42 parts; phosphate of lime, 53 parts; and only 3 parts carbonate of lime. In the interior of the full-grown tooth lies the remainder of the former tooth germ, the tooth pulp; this is the most sensitive part of the tooth.

Man has at the time of his birth twenty rudimentary teeth; these are called the milk teeth, which in course of time are loosened and drop out, to make room for the permanent ones. In the third month of the embryonic life the tooth germ commences to develop itself. In a horizontal section of the lower jaw we find small sacs of two or three lines measurement only; these are the first rudiments of the future teeth. In the fifth month the ossification commences; and if at the time of the birth the jaw be examined, the sacs will be found considerably enlarged, and divided by partitions, each containing two sacs; the upper one forms the enamel, and the lower one contains the tooth germ, in which the real tooth substance is secreted. At the bottom of the sac rises the future tooth germ, like a bud; it grows and secretes the tooth substance outwardly and toward the top. Above this

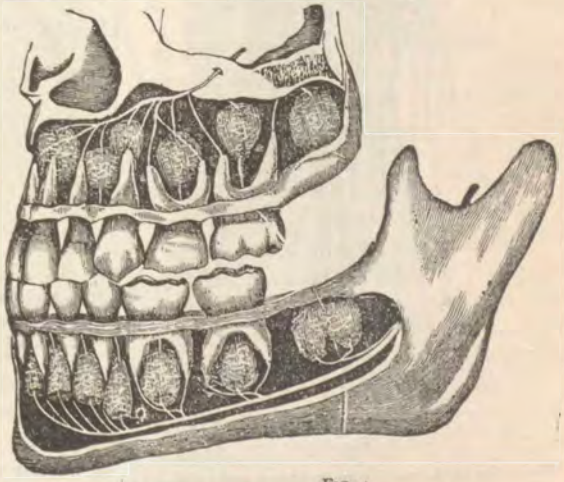

FIG. 4.

Upper and lower jaw of a child, showing the relative position of first and second teeth.

lies a second sac; the little tooth grows into this second sac, which forms a kind of a cover, and this develops itself as the enamel. As the tooth germ with the secreted tooth

substance adjoins the enamel, they combine, and the tooth presents itself in its first formation. The tooth germ increases in all directions, and ossifies on the surface. While it secretes bone substance outward, it diminishes continually; and finally the bone substance of the tooth has compressed the tooth germ into a very small place; it has outwardly secreted more and more tooth substance, and there is finally only a small space left for it in the middle. When now the tooth is pretty well developed, it gradually breaks through the jaw. The upper edge of the jaw in children is usually covered with "tooth flesh."

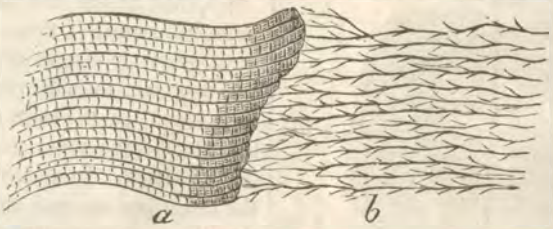

FIG. 5.

Toothbone and enamel in their respective connection (magnified 350 times); *a*, enamel fibers; *b*, tooth tubes with many branches.

FIG. 6.

The tubes of the tooth germ, prepared and isolated by application of acids (magnified 350 times); *a*, piece of the wall of the tooth-germ cavity; and *b*, the free tubes.

In the lower jaw of the new-born child the *tooth germs* and *tooth sacs* lie in cavities. Below those teeth which first break out are yet the germs for the second teeth. The lower incisors are the first in breaking out; then follow the upper ones; and then the other teeth. The shedding of the milk teeth sets in at the seventh year, and, with the exception of the wisdom tooth, generally terminates with the fourteenth year. During this shedding the milk teeth drop out, because the germ of the same is pressed and absorbed by the advancing second tooth. This pressure makes the shedding of teeth sometimes painful.

The incisors need for their perfect development seven years; the eye-teeth eight; and the first molars ten; and the second molars twelve years. When the milk teeth first commence to break through, their pressure on the gum causes an inflammatory state, therefore more saliva is secreted, and the child puts his fingers into the mouth. It is too much the practice, especially in England, to facilitate the breaking through of the teeth by lancing the gum. The old custom of giving to teething children hard things, as orris (florentina), cocoanut, rubber rings, etc., for biting or rubbing the gum, is wrong; it may relieve the irritation momentarily, afterward the pain increases greatly. The natural and most effective

FIG. 7.

Surface of the enamel, with the free ends of the enamel fibers, so as to show their sexangular sectional plan (magnified 350 times).

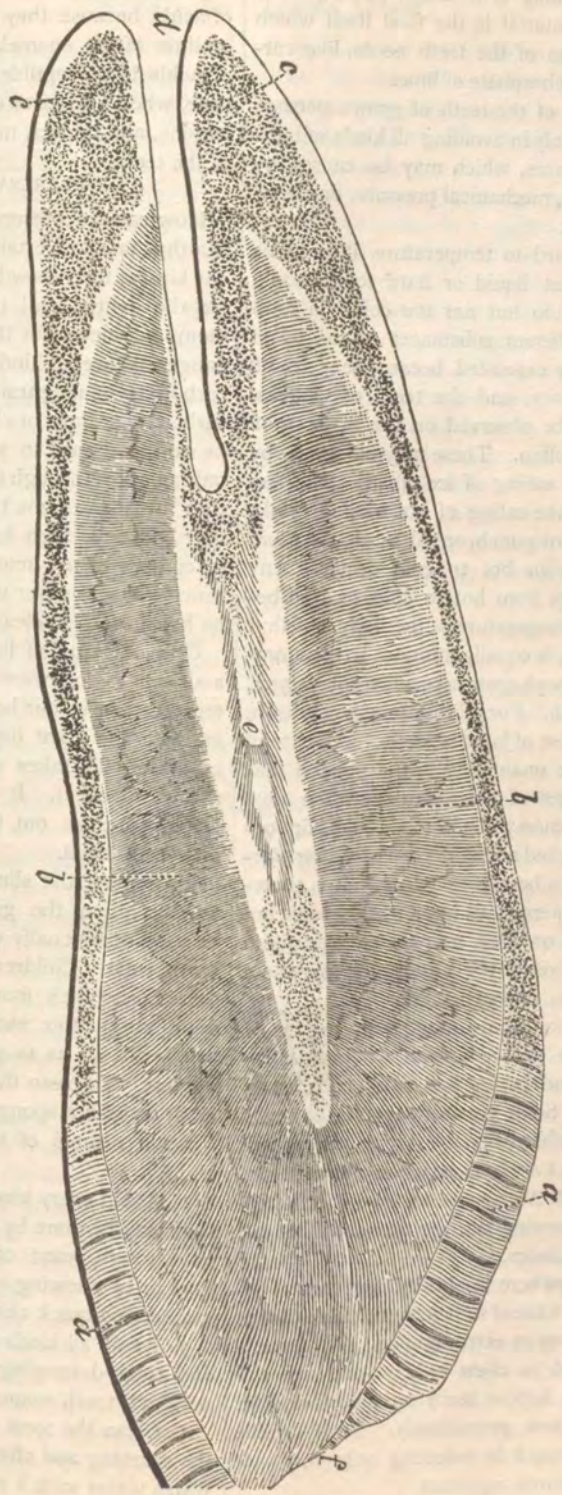

FIG. 8.

Vertical section of an incisor (magnified 15 times); *a*, *b*, *c*, and *d*, as in Fig. 1; the cavity of the tooth germ is already greatly diminished, by the growth of the tooth, as is always the case in advanced age; the masticating surface is also much worn off, the enamel thereupon is gone.

help in teething is to assist the organism with such material in the food itself which the formation of the teeth needs, like carbonate and phosphate of lime.

The care of the teeth of grown persons consists mainly in avoiding all kinds of injurious influences, which may be caused by temperature, mechanical pressure, or chemical matters.

1. In regard to temperature, it is to be observed that liquid or hard food should neither be too hot nor too cold; in both cases the different substances of the tooth are unevenly expanded, because they are of uneven density, and the teeth get cracks, which can be observed on the incisors of ladies very often. These may be caused by the careless eating of ice cream. Not less injurious is the eating of hot soup or drinking coffee, hot punch, or still more, the rapid changing from hot to cold drinks. Any quick change from hot to cold, or even between the temperature of the body and that of the drink, is equally injurious to the stomach, the œsophagus, especially the larynx, and the teeth. For all the three it is poison, and the cause of later sickness. All careful dentists are unanimous in the opinion that rapid changes of temperature are the most dangerous enemy of the teeth, and Hippocrates remarked: *Frigidum inimicum dentibus* (cold is hostile to teeth). It is therefore a very pernicious habit to take after hot tea, coffee, or soup, something cold; more dangerous yet is the incautious enjoyment of ice cream, of sherbet, etc.

2. Another disadvantage to the organs of mastication proceeds from *mechanical influences*, and indeed just as much from *too little use*. Some persons demand too much of their teeth, when, for example, they crack the stones of apricots, peaches, cherries, etc., with their teeth, or extract corks from bottles, or in sewing bite the thread off instead of using scissors.

As everywhere in physical and mental respects, the want of sufficient exertion is about as pernicious as extravagance. Whoever is accustomed to chew only on one side will soon have hollow teeth on the other side, and lose them prematurely. To spare the teeth too much by selecting only very soft food, is likewise injurious.

3. Most dangerous especially are all kinds of acids, because they affect the carbonate of lime of the enamel. The bad influence of acids is perceptible in summer and fall time, when a too free use of grapes, apples, lemons, and berries, may injure the enamel of the teeth.

PRESERVATION.

How can we preserve now our teeth in a healthy state? Certainly not by the use of any kind of tooth-powder, which is only good for the dentist and the druggist who sell them, but never for the patient. Likewise dangerous are all kinds of alkaline earth, as carbonate of magnesia, carbonate of soda, carbonate of lime, or chalk. The same is to be said in regard to soaps, which will have only an effect through their alkaline reaction; they are at the same time disgusting; whoever has once seen how most of the soaps of commerce are manufactured out of old rancid fat will never use them any more, if he has an idea of cleanliness left.

Only one kind of liquid is useful to teeth, and this is lukewarm water, of the same temperature as our body; one will perceive at once the right degree of warmth, as a mouthful of it taken will cause neither cold nor warm effect. It should never be neglected to clean out the mouth thoroughly after each meal.

To remove the slime from the teeth, and to strengthen the gum, burnt alum may be used occasionally with water and a good toothbrush. Children ought to be accustomed from their fourth year to brush their teeth daily after each meal with a small soft brush, so as to get used to it for their lifetime. To clean the teeth with a piece of cloth or with a sponge is useless.

As a resumé of the foregoing, we will add:

1. Avoid every kind of mechanical injury that may be done by biting on hard objects, as through want of exertion in chewing food or by chewing on one side only.

2. Avoid quick changes of temperature.

3. Avoid all kinds of chemical substances and teeth-destroying acids, as the alkaline powders, tooth soaps, and tooth pastes.

4. Clean the teeth daily and thoroughly in the morning and after every meal with lukewarm water with a moderately stiff brush.

OPPOSED TO FLESH-EATING.

WE find that the discussion of the propriety of using flesh as human food is growing, and much attention is given it in the press at large. Some articles which have appeared in *The Household* recently have taken strong ground against the carnivorous habit, and must please the strict hygienists. One of these articles, by Mr. G. J. Colby, we copy in part:

"There was no violence in Eden! Gridirons and slaughter-houses were not among its furniture! And even after the sad disobedience and fall of our first parents, when, driven out from the beautiful garden, they were not allowed to kill and eat the flesh of animals, but commanded to till the soil and eat the 'bread' raised therefrom by their own labor. Nor does the history of the race, for near two thousand years, give any intimation that flesh was used for food. But it does indicate good health, long life, robust sons and fair daughters, as the result of proper food.

"After the flood, flesh-eating was allowed. And, as a natural consequence, the age of man reduced to one hundred and twenty years. Diseases of various kinds multiplied. Doctors of medicine were in demand, but, in spite of all they could do, as mankind became more and more addicted to the savage custom of flesh-eating, their average term of life grew less, until it was little more than twenty years. Then commenced a reform, which has, already, doubled the average length of human life. And which, if continued, may double it again in a few generations.

"The Bible mentions three worlds, as the abiding-places of the human race: past, present, and future; the world that was before the flood; 'this present evil world;' and 'the world to come.' All Bible religionists will agree that flesh-eating was not allowed in the first, and will not be in the last; but only exists as one of the bad habits of this present evil world.

"We have the record of Bible history as to how the first change was effected; but there is such a difference in views as to the manner of the second change, from the present to the world to come, that we are puzzled to know just what to expect, or how to interpret the promises, prophecies, and revelations, as to the 'new earth wherein dwelleth righteousness.'

"But however the change may be accomplished—whether by a sudden transition, at the second coming of Christ; or by reformations produced by the universal preaching and acceptance of His Gospel; or by the absence of evil when Satan is bound for a thousand years; or by the increase of knowledge, scientific improvement, and reform—it matters little, so long as we are agreed that flesh-eating was not allowed in 'Paradise Lost,' and will not be in 'Paradise Restored.' We can stand with one foot upon each of these great truths, while we consider the propriety of its use in the present time.

"And the fact that it is only allowed in this present evil world, along with other bad habits and customs—the use of strong drink, slavery, polygamy, etc.—which can only claim the negative sanction of Scripture, is strong presumptive evidence that it is not a good or necessary habit, and gives as good a 'warrant' for denunciation as we have for the other customs, which are now considered sinful by most Christian people.

"It is no more singular that those who are in the habit of eating flesh should think that they feel the need of it, than that those in the habit of using tobacco, beer, etc., should feel such need. Nor is it strange that erroneous opinions should so generally prevail in regard to flesh as food. It is the natural result of ignorance and want of thought. And such opinions will continue to prevail so long as people refuse to read, think, and talk upon the subject. Many good people really think they need flesh food in cold weather, to keep them warm. But lean meat is one of the poorest of foods for that purpose.

"Dr. Hanaford, in the article on 'Spring Diseases,' in the May number of *The Household*, names 'the sweets, the starch and the oils,' as the three best classes of 'respiratory' or heat-producing food. And

of these, the last, including meat fats, is condemned as the worst. So meat is not needed for heat. And to suppose it is a good food to give strength, support and build up the system, is another gross popular error. It is both poor and impure in quality, and at best but a second-hand article; having been once digested and re-organized in the animal body. The natural course of evolution brings the dead, inert mineral and gaseous matter up through the vegetable to the animal organization. Without the vegetable the animal could not exist. For the animal stomach can not digest, nor the animal organization assimilate, dead matter. Everything must first be digested and organized in the vegetable. Then the animal can take it, redigest and re-organize it into the animal form.

"And now we come to the most important fact in the evolution of matter. It has reached its highest point of organization. Having been twice digested and twice organized in a living form, it can go no higher! But immediately it begins to disorganize and go back to its original condition of dead matter. This process is constantly going on in the animal body; and while one system of tubes is carrying the food throughout the body, to build up and organize flesh, another system is employed in carrying out the disorganized, broken-down, dead matter. And as this last system of tubes must reach and permeate every part of the body, and be always more or less filled with dead matter, it follows that flesh meat must always contain more or less of such impure matter, which can not be again used in building up the body, and when taken as food can only serve to load the blood with impurities, and clog the depurating tubes.

"It is not therefore proper or fit that matter should thus pass more than once through the animal organization. And when it does, there must of necessity be more or less trouble caused by it. I think nearly all diseases that mankind are afflicted with, have been produced by this pernicious, unnatural habit of flesh-eating—using the same food over and over until a large part is disorganized, and the whole saturated with dead matter and infected with disease. Once is enough! When the animal dies, let its flesh go back through the cleansing processes of nature, and come up again in its pure form as a vegetable before we use it as food."

THE DISEASES OF GREAT MEN.

SOME of the most illustrious men and women have been the victims of maladies of the nervous system. In almost every treatise on epilepsy, Cæsar, Mahomet, Petrarch, Napoleon, and Byron are mentioned as having been subject to this disease. It has been supposed by some that "the thorn in the flesh" of Apostle Paul was his liability to epileptic attacks. Henry IV. of England, after some time of ill health, became subject to dreadful fits, which would cause him to fall down apparently dead. These were undoubtedly epileptic in character. On the 20th of March, 1413, while he was at church, he was seized with a fit and soon expired, being at the time forty-seven years old. Charles II. of England, in the midst of a life of vicious indulgence, was attacked by apoplexy, and died after a few days' illness, on the 6th of February, 1685, in the fifty-fifth year of his life. Leonard Euler, while playing with one of his grandchildren, at the tea-table, was seized with an apoplectic fit, and died in a few hours, at the age of seventy-six. Among the apoplectics we have such notable characters as Dickens, Thackeray, and Napoleon I. Sir Charles Bell died on June 12, 1842, of angina pectoris. He awakened with a frightful spasm of angina, asked to be supported, and immediately expired.

History furnishes abundant evidence of the frequency of affections of the mind among the magnates. Bishop Warburton, John George Zimmerman, Dr. Johnson, James V. of Scotland, King Henry of England, Queen Elizabeth, Frederick II. of Prussia, were all the victims of melancholia; Queen Francisca of Portugal, George III. of England, Tasso, Pascal, William Collier,

Cowper, Charles XII., and Dr. Johnson were subject to attacks of insanity; Victor Amadeus I. of Sardinia was a victim of kleptomania. Of the three disputed discoverers of modern anæsthesia, Wells died of insanity, Morton from a stroke of apoplexy, while Jackson is hopelessly insane. Dr. Adam Clarke died of cholera; Oliver Cromwell, of ague; Robert Duke, of starvation; Sir Humphrey Davy, as a result of injuries to an elbow; Alexander the Great, of malarial fever; Augustus II., of grangrene of an old wound; Camillus, of the plague; Chaucer, of old age; Queen Mary, of smallpox; John Racine, of abscess of the liver; Dr. Wm. Hunter was subject to gout, but during one of these attacks he was paralyzed and shortly died; Napoleon III. died of embolism; Prince William, of England, and Shelley were both drowned; Thomas Chatterton and the wife of Shelley committed suicide; Lord Byron fell a victim of remittent fever; John Keats, Edward II., and Lænnec were destroyed by phthisis pulmonalis. Professor Dunglison perished from disease of the heart; John Locke was a sufferer with asthma; Burns shortened his days by his excesses; Southey was demented; Jeremy Taylor died of some fever; John Bunyan died in 1688, in London, it is said, in consequence of a cold caught in a journey undertaken by him in inclement weather, with the object of reconciling a father and son. Thomas Otway, perhaps, choked. "His death has been frequently cited as a striking instance of the miseries of a literary career. It is related that, when almost starving, the poet received a guinea from a friend, on which he rushed off to a baker shop, bought a roll, and was choked while ravenously swallowing the first mouthful." Louisa, daughter of George II., when Queen of Denmark, died of an operation for hernia, at the early age of twenty-six. Queen Caroline, her mother, also died of hernia, after an operation by the celebrated Ranby; and Caroline of Brunswick, wife of George IV., fell a victim to strangulated umbilical hernia. In regard to Washington, the weight of authority is in favor of the view that the cause of his death was œdema of the glottis rather than croup, as is so often stated.—*Medical and Surgical Reporter.*

In scanning the above the reader conversant with the principles of hygiene and physiology can infer the occasions for many of the diseases mentioned, as they arose mainly from ignorance or disregard of the laws of health.

THE ECONOMY OF FORCES.

In our Line—Intelligent Planning—Canning Fruits—Young Housekeeper—No Allowance for Sickness—"Carrying Stock"—Nature's Cleaning Up—Watch your Grains—How to Think in Time—True Time-Saver—Noiseless Housekeeping—The Cooking Economy of Thought—Economize Wisely.

I AM aware that this is a very learned expression, or that it is used to express some wonderful processes or conditions of nature which the learned alone are supposed to be able to appreciate. I will hasten, then, to announce that I do not propose to go into any abstruse and learned investigations, though I would be glad enough to be able to do so. I doubt not my usual readers would take great delight in pursuing the demonstrations that nothing in nature is lost; that light may be converted into heat, and heat into motion; that the very food which is grown so lavishly for the use of the animal world, if not used in due time is taken to pieces and its elements are distributed in the best shape and placed where they will be taken up and incorporated in another year's growth of food, thus keeping up a continually recurring supply of food in its best and freshest condition, with the least possible waste of materials in its manufacture. Many charming illustrations of the perfection of Nature's housekeeping in this little world of ours would prove both pleasant and profitable subjects of thought to us housekeepers on a smaller scale; but for the present we propose to apply what we do know to the economy of forces directly

IN OUR LINE.

I suppose it would surprise you a little if I should say that the most economical among

us are exceedingly extravagant, especially since we all believe that women are, both by disposition and practice, far more economical than men. But it is because I believe this that I address to the women especially, as being the best able to reduce them to practice, some stray thoughts and suggestions that have long been running in my head, and though they may not all be new or fresh to any one, they may still start some poor tired lady into helpful lines of thought. And both as specimen and illustration, I may at this period of the ingathering of the food products of another season suggest the desirability of

INTELLIGENT PLANNING

of living for the coming year. If you live in the country (which is the normal place for man to live), there are certain supplies which you must lay in during the season of their abundance. As it is not necessary under ordinary circumstances for you to lay up all you can get, nor perhaps all you have more than your present wants demand, you are called on to decide how much you will need before the commencement of another period of supply, that you may put what you need in good keeping condition and dispose of the surplus. This work you have already commenced by

CANNING OR DRYING

such fruits as have already had their day for this year, such as strawberries, cherries, currants, raspberries, whortleberries, plums, and perhaps peaches and tomatoes, not forgetting some pie-plant, both for drying and canning. The quantities of these which you have put up has depended, first, on your supply; second, on your tastes or preferences for the various kinds; but controlling both has been the probability of demand. You have some idea what will be the size of the family for which you will be called upon to provide, how many visitors you will have, and what you can afford to put upon the table. If you are a

YOUNG HOUSEKEEPER,

and not accustomed to make such estimates, you may help your judgment somewhat in this way: You will have this year an abundance of apples that will last until when?—the first of June; plenty of Northern Spy, but no Russet; not so great a variety of apples as usual of those kinds that will keep after January; a fair supply of sweet apples; grapes and pears that will keep until the holidays; squashes and pumpkins abundant.

Very well; then we will say no canned fruit is to be used until the first of December; not more than one can per week during that month, and as many more for the holidays, which makes eight in all. We have allowed none for Thanksgiving, taking it for granted you will be at home on that occasion. If your holidays should also be spent at home, you can find some poor family whom you can make glad with the fruit you do not need to use. During January allow three cans per week, and, as in February and March, you will draw largely on your dried fruit, perhaps the same allowance in cans will be satisfactory; in April and May and until the middle of June, four cans per week. Thus we have 40 cans + 36 + 8 = 84 in all.

Then there will be a period after strawberries during which you will need more canned fruit, as we raise no cherries here, and the currant worm has swept off our currants; you will probably need the remaining sixteen to round up the hundred with the year. I have made no allowance for visitors, taking it for granted that you will be absent from home enough to balance that. If not, you can make your own estimate, according to the circumstances. Now you can make up your hundred from the supply yet on hand—peaches, crab-apples, tomatoes, pears, and grapes, especially grapes. You will find canned grapes not only an agreeable fruit for common use, but very acceptable to sick neighbors. You remind me that I have made

NO ALLOWANCE FOR SICKNESS.

Why should I? Would you have me deliberately plan for such a sad wasting of life-forces as will oblige you to give up all work and care and thought and lie prostrate and helpless for a greater or less length of time, in order to recover your exhausted vitality? I would far sooner plan for such a conservation of life-forces as would prevent any such result. Prevention is better than cure. But

you insist that sickness will come, and we should be prepared for it.

I am not certain that it will come. I have not so learned life. But if you or your husband belong to a family with vitality so exhausted that you can not escape frequent prostrating illnesses, you should, of course, prepare for them whatever is necessary. But what should that be? Not jellies nor preserves nor sweet pickles, nor any other such nonsense. My observation about sick people is that while they do not usually eat nearly so much of anything as when well (and very properly too), yet what they do eat should be of the very best and most easily digested. Plain canned fruit of any kind is much better for them than that which is saturated with sugar. Few things relish so charmingly as canned Isabella or Concord grapes, raspberries, whortleberries, or strawberries, and the juices of any of these canned fruits put into water make a refreshing drink for the feverish and the convalescent.

If, however, you will make extra provision of these things, I consent (supposing I have anything to say about the matter), with the proviso that if you do not need them yourselves for sickness, you will give them to some of your less sensible neighbors.

You reply, perchance, that you can keep them over another year. But I object to making any provision of canned or dried fruits to keep over. It is

"CARRYING STOCK"

that you would have better sold out. It is an investment of fruits and cans which pays you nothing, and is continually deteriorating. It would be much better if you should use your cans twice. You would then reap a double benefit from them, where, in the other case, you reap none.

Besides, it is better for the cans. If tin cans are used, the sooner they are emptied the better, for the acid is continually working on the tin, and still more on the solder, which is partly lead, and for this reason it is best never to purchase tomatoes of a previous season's canning. Glass is so much more convenient and so cheap, that tin is now seldom used in the family; but the covers of glass cans are corroded by the long action of the acid. Sometimes the corrosion fastens the cover to the can and ruins the rubber, if not the can; but this seldom happens, excepting with those cans which stand from year to year. So you not only get no return for the use of the cans when you keep them over summer, but the cans are injured much more than when they are emptied and cleaned.

In the case of dried fruit, the risk is still greater, unless it has been scalded and put away in cans, and then the labor and expense are to be put into the account. So we always take with grains of allowance the evidences of thrift afforded by the keeping of fruit from year to year. It is a sort of fighting against nature that does not pay. It should be our duty to work with nature, intelligently, and not to fight her. We might, indeed, take many good lessons from

NATURE'S CLEANING UP,

if we were at all attuned to her common-sense way of doing things. Look at her management about the dried fruits and grains. When the warm weather comes and new fruits and grains are well advanced, she sends swarms of insects to devour the old supply. For our own good we ought to let it go, because she is abundantly providing a fresher and a better. By the time August has come around, with its abundance of fruits and vegetables and green corn—so abundant, indeed, that we almost forget to watch the meal and the flour-barrels; it seems almost impossible to keep them sweet; and what the insects have been kept out of, spoils and sours by the damp, close, hot weather. You ask in distress what you can do. We say,

WATCH YOUR GRAINS

beforehand. Kindly accept the plans of nature, and lay in your stock with reference to this closing up. In July put what little you have left into closely-covered pails and jars, and sift it or examine it effectually before using it. Clean out your meal-bins and flour-barrels and have them ready for a new supply in September, or, better still, if you can wait till October. Use up the little parcels of hominy and rice and barley and samp and crackers and dried sweet corn, or,

if you can not use them all, give them away beforehand, while they are sweet and good.

Perhaps you complain that this requires a great deal of care and forethought. Well, is forethought more difficult or exhausting than afterthought when matters can not be helped; when you have them all to dispose of just the same, only you do not now know what to do with them; with the reflection that you have lost so much and the store-room and the bins must be cleaned out when they are all alive with repulsive things? If you do not know

HOW TO THINK IN TIME,

begin as early as June, to prevent the loss of these things, to make memoranda in a little book, with a pencil attached, and kept in the store-room, after this fashion:

Under the head of "nearly out," write:

Rice—order 3 pounds.
Zante Currants—1½ pounds.
Hominy—5 pounds.

Under the head of "surplus," put an estimate of what may be given away, thus:

10 pounds rye meal.
7 " oatmeal.
Package of sweet corn,

leaving a good margin on some things to serve in case of emergency. Of course, these figures are only for small families, but the same plan is quite as suitable for large families, the time for commencing these memoranda depending on the frequency with which supplies are ordered. In any case, it is well to have your stores so arranged that you can tell, at a glance, about how much you have on hand, and rather than burden your memory with it, if it is a burden, use the memorandum-book freely. There is no economy in taxing your brain to carry what paper can carry just as well.

I am well aware that there is a certain large class of housekeepers who will think *this* method altogether too much trouble. To be always looking after things they think costs more than it comes to. They "get what they think is necessary," and then if it spoils they can throw it away.

But the point is, that it *is sure to spoil*, sooner or later, and we should recognize that fact with all kinds of supplies. We do not purchase a bushel of tomatoes when we know that we shall not be able to use up one-half of them before they spoil; and it is quite as absurd and rather more costly to purchase flour, grains, and dried fruits in the same style. Sometimes this waste is due to a disposition inclined to hoarding. Many, many times I have seen delicious fruits put away until they were half decayed and their delicacy entirely gone. The vitalizing properties of many kinds of fresh fruits rapidly disappear, and the best way to hoard them is to eat them when at their best, and tax your judgment to enable you to do so. There are many, too, who will say that they have too much to do, they can not always be thinking about such matters, but this plan is the

TRUE TIME-SAVER.

When you have looked out for these things in this methodical and reliable manner, you are at rest about them, and ready, with a free mind, for something else. You save yourself the weariness and the vexation of loss, which are a much greater tax than the requisite forethought. Besides, it helps you to acquire a sort of strength which naturally flows from being master of the situation and which, on the other hand, is very seriously broken down by the reflection that you ought to perform such and such duties which you are perpetually leaving undone. The same principle applies to many other departments of housekeeping, such as cleaning your bed-rooms and cellars at the proper time, and also to your wardrobe in putting away your furs, and putting in the famous "stitch in time." This sort of promptness and looking ahead is the foundation of thrift. It is true that this famous quality is very often consorted with anxious care, and it brings up the vision of worn-out mothers sinking into premature graves, or of bustling, busy women who are always turning things upside down with their rummaging and house-cleaning, or following the men about with mop and pail, to clean up any chance-mark their boots may leave on the immaculate floor; but neither of these women are our models. In fact, we are disclosing to you the great secret of the effective

NOISELESS HOUSEKEEPING,

about which we see so many mysterious hints nowadays, where everything is done by magic, no one knows how or when, and yet well done. No doubt a good deal that is written under this head is nonsense. The fact is that with all the "modern improvements," a great deal of our housework still requires time and hard labor; but it does make a world of difference how you take it, whether you let it drive you, or you do the driving yourself. All your work should be more or less definitely planned beforehand, for a week or a month. And if you bring in some one of these active duties for every morning, you will soon dispose of them. Say if you have washing for Monday and ironing for Tuesday of every week, and thus have only Wednesday and Thursday for extra jobs, let the examination of the dried fruits be on Wednesday, and the putting away your furs on Thursday of one week, your examination of the meal-room and of the cellar for the next week, and have it all in your memorandum-book and understood beforehand so that there shall be no delay in getting about it in good season. I know some housekeepers would have all these extra jobs going on some one day, but that sort of thing does not belong to the noiseless, delightful housekeeping. Such a woman makes grand discomforts for others, and probably makes herself sick besides. But if you take some of the hard work for every day, and some of the rest also, then you keep regular habits, you get your hard work done with comparative ease, and you have time for other pursuits. This is no unimportant part of the economy of forces in a busy woman's life. Very likely, however, you have more than your match with

THE COOKING.

There are many other women in the same predicament. They get themselves all heated up and overdone every day with the preparation of the dinner, and they can not, for the life of them, understand the wonderful stories of ladies preparing elegant dinners and then presenting themselves, all cool and smiling, at the table to serve them. To tell the truth, an ordinary big dinner, with soups and meats and vegetables and entreés and pies and puddings is a big undertaking, and it can not be prepared easily without help. The economy of forces here must come in with a reduction in the number of the dishes by substituting a delicate simplicity of preparation for the complicated sauces, soups, and gravies; by having those dishes which are served harmonize so perfectly that all shall seem necessary, and, therefore, none of them be sent away untouched, and especially in serving fresh fruits and nuts at the dessert, instead of puddings, pies, tea, and cakes.

The very profusion of our markets seems to confuse our housekeepers, and they think the table niggardly unless all the vegetables in the market are put on at once. Variety is very agreeable, but it is far more highly appreciated if we can have it at different meals. If a vegetable is well prepared and we relish it, we would prefer to be helped to it a second time, but usually there is so little of it remaining we must take another dish. And it costs you twice the trouble to prepare the two that it would to furnish a sufficiency of the first, and you have prepared neither of them so well as you would either alone. Another point is, if you have one dish that requires much labor in the preparation, let the others be especially simple. Keep this in view in planning your dinners. Here, too, you will find it a great help to know what you have in store and its condition. If you plan for a tomato pilau and find your rice out or wormy, your plan for a harmonious dinner is spoiled; you must get up something else in a hurry, and the annoyance coming just when you are hard at work in the heat, is far more of a tax than it would have been to make a study of the situation beforehand.

Perhaps you will smile at my persistence in that matter, but, really, if you were to tell the truth, I suspect you would say that you find it one of the most difficult of all things to be always thinking about these matters. But there is the point, or rather, there are two points. In the first place, I do not wish you to be always thinking about them. I wish you to think once, or maybe twice, effectively, and then putting them out

of your thoughts, be ready to think about something else. The real difficulty lies in your lack of

ECONOMY OF THOUGHT.

Your ability to think and plan is your greatest gift in the line of effective work; it is your reason, the thing that distinguishes you from the brutes. You would think it one of the greatest calamities to lose your reasoning powers, and yet you deliberately sacrifice their use during a great share of your waking hours. Your work is, in no small degree, of such a nature that you might be pursuing it and still permit your thoughts to be pursuing a profitable train of reasoning, of study, or planning. But do you ever look after them to see what they are doing? Very likely, you can not even tell what you were thinking about while you were preparing breakfast this morning. You were certainly not planning your work for the day, for after breakfast you loitered about for an hour, gossipping with your neighbor a part of the time, and your morning's work, which might have been done by nine o'clock, was not done yet at ten, and then you found out that you had let the fire go down without canning the remainder of that half-bushel of tomatoes that will spoil before you can use them up. Now, I can tell you where your thoughts were. They were running over the incidents of that story you read last evening. "Literary," you say? Not a bit of it. To what *purpose* were you thinking about that story? None at all. Your thoughts were quite wandering and aimless, and during the remainder of the morning you were with equal aimlessness giving up your thoughts to your neighbor's gossip about the accident down at the village. Studying about how you could help the sufferers? No, only just saying to yourself, "It is a pity for A and it serves B just right, and I wonder how C will take it." Now that you have sat down to your sewing, you are doing no better.

And you are the one that has no *time* to think about so many things! You are throwing away the most precious thing in your possession. "As a man thinketh, so is he," and it is no less true of a woman. Have you no problems to study out? Is there nothing you wish to know? No matter if you have not had much "book learning," it is not the amount that is poured into your head that will make you wise, it is the right use of what you do know. If you continue to let your thoughts run away with you, you will never rise above your present level.

How can you help it? Begin when you are alone and quiet, with your work plain and well planned out, and set yourself to study on some topic to think about, and master it. It may be something you have been reading about, and it may help you to have the book before you to refer to or to memorize. You will have much difficulty at first in thus controlling your thoughts, but if you stick to it you will succeed and it will be one of the greatest acquisitions of your life. You will be mistress of "the situation" in hundreds of cases by virtue of your ability to think, when, without it, you will be the slave. If you forget, and your thoughts run away from you, bring them back as you would for any other purpose, even "tie a string around your finger." This systematic method of doing things which I have been recommending will be a very great help to you. Further,

ECONOMIZE WISELY.

Do not build a fire that will cost five cents in order to can tomatoes that are worth only six, for your time is worth something. Do not spend half an hour looking over the vines for half a pint of peas. Do not turn over a scrap of linen twenty times in order to save in cutting what is not worth two cents. The difference between the rich and the poor in this country lies much more in saving and planning than in earning, but it is not of the kind that "skins a flint to save a sixpence." That cultivates narrowness of soul instead of the economy that saves for the sake of giving more freely. Do not economize time from reading to put it into tucks and ruffles. Do not strain your eyes to economize lamplight. Learn to choose the things that economize force, and then lay out your force so that it will generate more force. This is the true economy of forces.

JULIA COLMAN.

CHILDREN'S LEGS--HOW THEY SHOULD BE DRESSED.

IT was with deep regret that we read in that excellent paper, *The Rural New Yorker*, of the 18th of August last, an article on the subject of the dressing of children's legs, and what is worse, that a physician should have written the article, which is as follows:

"The question of short socks instead of stockings for children is," says a physician, "I am glad to see, being noticed; and I trust the result will be that the custom of confining children's limbs in hot, and especially in dark-colored stockings, will, at least in summer, give way before the pretty fashion—now almost universal in France, Italy, Belgium, and Holland—of keeping boys and girls, especially the latter, in socks. As a medical man I am convinced that, provided a child is healthy, and otherwise warmly and suitably clad, it is all the better at any time of the year for having its limbs exposed. In summer there is no doubt about it. There is no finer health-giving agent than fresh, warm air and bright sunshine. Children can not have too much of either. Their limbs ought to be bathed in both. Those who see our little people wading on the sea-shore, delighting to paddle for hours in the waves, their scanty clothing tucked up charmingly, know that children are never so happy as when their arms and legs are bare and free."

The Doctor tells us that in France, Italy, Belgium, and Holland it is the almost universal method of dressing the limbs of children (we suppose he means legs, although the arms, a physician ought to know, are just as properly called limbs as the legs are) in very light stockings or socks, thereby leaving the limbs bare. Now, in a climate like the United States and Canada, where we have six feet of snow and the thermometer at from zero to thirty degrees below, it is a cruelty to adopt fashions, originating in sunny France, in this cold climate. Our idea is that the limbs should be dressed more warmly in cool weather than other parts of the system; but the Doctor wants the children otherwise warmly clad, and let the legs go naked at any time of the year. We have seen hundreds of children with fur caps, fur tippets, muffs, heavy cloaks trimmed with fur, with any quantity of flannel around the body, but the legs covered with thin cotton stockings and a slipper on the foot, rendering it almost impossible for the blood to go to the feet and back again. Is it any wonder that children have congestion of the brain, trouble with the lungs; that they die of brain fever, that they are precocious, all head and no body? If the article in question had been inserted as coming from a layman, we could have borne the infliction; but coming from a physician, and uttering it as his deliberate opinion, it is thoroughly shameful. Probably that doctor drinks whiskey, smokes ten cigars a day, with numerous hygienic abuses. Fashion-mongers and uninformed mothers, who doubly dress the bodies of their children and do not half dress the legs and feet, may circulate the article and read it with avidity. We expect to see it copied widely. We sometimes think that error flies a thousand times faster than truth, and that the human race seems to take delight in spreading falsehood. But we snub the doctor, whoever he may be, and trust that no sensible people will ever employ him as a medical adviser.

In summer-time, we would dress children lightly and loosely; but whenever it becomes cool, the legs should have warmer covering than the body, and the back should be dressed more warmly than the front. People take cold a thousand times by having thin, light covering on the back, while the clothing in front is heavily wadded, and of many thicknesses. Men wear woolen vests with a thin, muslin back; they wear plaited, double shirt fronts, with one thickness on the back; the dress-coat is wadded and buckrammed in front and lapped and buttoned, but the back is the single thickness of the cloth; the over-coat is heavily made in front, and sometimes that may be wadded across the back, but it is safe to say that people are dressed four times more warmly in front than they are in the back. Those who have any trouble with their lungs should remember that they take cold through the spinal region more readily than through the front of the chest.

RECORD OF SCIENTIFIC DISCOVERY.

The Range of the Microscope.—Although Helmholtz and other mathematicians of the first order who have applied their methods of analysis to the subject, have alleged that the limit of visibility with the microscope has been reached, later investigations disprove them. The limit of visibility has been named as the 180,000th of an inch because of the assumed insufficiency of the light to define smaller objects. But this view is not wholly accepted by microscopists. The Rev. Wm. H. Dallinger has made experiments which point to a very different conclusion. He employs a new method of practical observation specially adapted to testing this question, and has constructed lenses which carry the limits of distinct visibility far beyond the boundary above designated. Much smaller objects are thus revealed than the theory referred to would indicate as capable of being seen. Furthermore, Mr. Dallinger does not believe that the limit of division and visibility by instrumental means has been reached yet.

The Divisibility of Gold.—Mr. A. E. Outerbridge, Jr., of the Philadelphia Assay Office, has recently given a notable example of the divisibility of gold by exhibiting before the Franklin Institute some thin films of gold obtained by electric deposition upon copper, and afterward detached. These pieces of gold-leaf were translucent, and gave a green color to transmitted light. Mr. Outerbridge has thus produced films of gold so thin than one grain of the metal would cover nearly four square feet. This is 10,000 times thinner than ordinary writing-paper; and 2,798,000 of such films together would only make one inch.

Growth of Coral.—A Melbourne journal describes a remarkable piece of coral taken from the submarine cable near Port Darwin. It is of the ordinary species, about five inches in height, six inches in diameter at the top and about two inches at the base. It is perfectly formed, and the base bears the distinct impress of the cable and a few fibers of the coil rope used as a sheath for the telegraphic wire still adhering to it. As the cable has been laid only four years, it is evident that this specimen must have grown to its present height in that time, which seems to prove that the growth of coral is much more rapid than has been supposed.

An old Roman Calendar.—In digging near Ceri, Rome, there has been discovered a superb marble fragment of an ancient Roman calendar, containing the second half of the first five months of the year. Besides the usual indications of days, feasts, and the different games, there is a list of the principal solemnities; some of these last are quite new; others confirm conjectures which have been made by learned men on less certain indications. The most recent date which can be read is that of the dedication of the Altar of Peace by Augustus, in the 745th year of Rome.

Prof. Tyndall on Spontaneous Generation.—Prof. Tyndall, at the close of a recent address, said: "From the beginning to the end of the inquiry there is not, as you have seen, a shadow of evidence in favor of the doctrine of spontaneous generation. There is, on the contrary, overwhelming evidence against it; but do not carry away with you the notion, sometimes erroneously ascribed to me, that I deem spontaneous generation impossible, or that I wish to limit the power of matter in relation to life. Possibility is one thing and proof is another; and when in our day I seek for experimental evidence of the transformation of the non-living into the living, I am led inexorably to the conclusion that no such evidence exists, and that in the lowest as in the highest of organized creatures the method of nature is that life shall be the issue of antecedent life."—*Labor News.*

New Telescopes.—Messrs. Clark & Son, of Cambridge, Mass., are making a telescope fifteen feet long with an object glass of eleven inches in diameter, for the Government Observatory at Lisbon, Portugal, to cost $6,000, and be used for photographing the sun. Princeton College is to have a $4,000 one made with a nine-inch glass for astronomical excursions, and talks of getting a much larger one. The Clarks are also to make a gigantic one for Yale College, but it will take several years' work and cost $50,000, the flint for the object glass, which has already been bought in France, costing $6,000.

Conjunction of Mars and Saturn.—At a late meeting of the London Astronomical Society, Professor Marth exhibited some diagrams of the triple conjunction of Mars and Saturn, between July and November of this year. The dates of the three conjunctions are: July 27, 5.15 P.M.; August 26, 4.19 A.M., and November 4, 12.8 A.M., all New York time. The last of these occurrences will be the most interesting, from the remarkably close approach of the two planets, the distance between them being only eleven minutes of arc, or about one-third the diameter of the moon. Saturn, the greater Infortune, and Mars the lesser Infortune, of the old astrological systems, may now be found in the south-east.

About Metals.—Of the fifty known metals, vanadium is reckoned the most costly, and iron the cheapest, though really the most valuable of all. As estimated by commercial prices current, a pound of vanadium costs more than two hundred tons of pig iron. There are nineteen metals more costly than gold, though many of them are rare and prac-

tically valueless as far as applied to any practical use in their metallic state.

None of the metals are poisonous by themselves, probably because they are insoluble in their metallic condition. When metallic compounds are decomposed by electrolysis the metals are always attracted to the negative poles, and hence they are called electro-positive.

The Great Coal Fields of Ohio.—A district of one hundred miles square, including the counties of Athens, Perry, and Hocking, is the future coal field of this nation. It is to be the "Black Country" of the United States, as the noted district in Staffordshire is the "Black Country" of Great Britain. In fifty years it will probably equal Staffordshire or any district in the world. This district has twenty-two feet of solid coal in five seams. The great vein (properly "bed") is in places twelve feet thick, and nowhere less than six feet Mingled among the coal beds are inexhaustible beds of iron. The thickest is five feet deep at the outcrop; the thinnest, in places, sinks to six inches. But the thickness of neither seam is quite persistent; there are "waves" from time to time, which narrow the seam. The coal, on the contrary, may be said to run from hill to hill with perfect uniformity. Limestone is also present in any desired quantity.—*Nelsonville* (O.) *Gazette.*

AGRICULTURAL HINTS.

[The mind is the man. Farming, in the highest sense, is not simply doing the hard work necessary. This can be done by muscle when directed by brains. The true farmer is he who can plan, direct, and control skillfully.]

As this department is one which should contain the most recent gleanings of wisdom and experience, our readers and friends in the rural districts are invited to send us any items of value to agriculturists in general, and which should have a wide circulation. Due credit will, in every case, be given to the contributor.

Better Times for the Farmer.—The American farmer certainly needs encouragement, the encouragement of a better market, and a better financial system than the bankers and brokers, assisted by government, have given him. *The Agriculturist* thinks that he will have his chance soon, viz: "The experience of the past few years goes to show, that there will be no danger of 'over-production' in the future. We need not fear to raise as large crops as we can. The foreign market is large and steady, and will need all we can produce in the way of grains, meats, provisions, and dairy produce, to supply it. The low prices of the past few years have brought this about, and therefore have not been by any means an unmitigated evil. While we have been depressed and troubled by a reduced income from our farms, which has sorely embarrassed those who have been in debt, this has been the means of stimulating farmers generally to do better by their farms than they had formerly done. In no previous period has stock been so much improved as during the few years just past, and we have, in consequence, found a market in England for meat, which has saved our home market from demoralization. At no time before the present has there been so much of artificial fertilizing, and never before so anxious inquiry about the possibility of enlarging the crops, and using the most effective economy in farming operations. In the meantime thousands of persons are entering into agriculture and other industries; the wave of western emigration has broken upon a shore where the land, although valuable for pasture, is not arable, and it now flows back again upon the neglected lands of the East, which are being restored again to their former fruitfulness by means of most skillful operation. There is now a closing up of scattered ranks, and the farming interest is becoming consolidated. As population may increase, during the next twenty-five years, to double its present limit, and we have a hundred million mouths to feed in our own country alone, all the resources and skill of the farmer will be taxed to meet the demand for his products. The value of farms can hardly fail to increase year by year, on these accounts, and it will be to the farmer's interest to see that he neglects no means of making his more valuable property pay a higher interest than now. This can only be done by making it more productive."

Material of Farm Buildings.—The excellence of farm buildings does not consist so much in the materials of which they are built as in the use made of those materials. Useful buildings may be made of logs or prairie sods, or poles and coarse hay; and these, by skillful arrangement, may be made to serve as useful a purpose as dressed lumber and paint, or pressed brick. The main points are warmth, dryness, and ventilation; for food is wasted when an animal shivers in its stable, or when its health is injured by damp, filth, or bad air. A farmer who is thoughtful about such small things as this (although this is more important than it appears) may be taken to be a careful, thrifty man, who, by and by, will be able to build a barn with all the improvements, and to build it properly too. The old proverb, "Take care of the small things and the large ones will take care of themselves," is applicable to matters about farms and barn-yards especially. When the small things are well watched large ones are not forgotten.

Care of Harness.—The practice of washing harness with warm water and soap is very damaging unless a coat of oil is applied immediately after. No harness is ever so soiled that a damp sponge will not remove the dirt; yet, even when the sponge is applied, it is important to apply a slight coat of oil by the use of a second sponge. All varnishes, and all blacking that contains the properties of varnish, should be avoided. When a harness loses its luster and turns brown it should be given a new coat of grain black; first wash the grain surface thoroughly with potash water to kill the grease, and after the application of the grain black, apply oil and tallow to the surface. This will fasten the color and make the leather flexible. Neatsfoot oil only should be used on harness, and no more should be applied to the leather than it will readily absorb. A superabundance works out to the surface in hot weather, catching dirt, and in a short time looking very mean.—*American Stock Journal.*

New Farms.—It is said that nineteen thousand five hundred new farms were started in the new States and Territories last year. This simply means that just the amount of labor and capital required to do this was drawn from other localities nearer markets, and where both could have been employed doubtless to better advantage. All the old States have a great deal of unoccupied or unimproved land, which may be obtained cheaply. It has been a matter of wonder to us that enterprising men would leave the facilities and opportunities of settled districts for the rudeness and emptiness of far-off regions.

Potatoes.—The best fertilizer for potatoes, so says a good practical farmer, is prepared after the following formula: Mix thoroughly one bushel of salt, two bushels plaster of Paris, four bushels air-slaked lime, and eight bushels of good wood ashes; add to this as much, in bulk, of clear sand or loam, and put a large handful in each hill. This quantity is sufficient for an acre. It is cheap, and easy to procure a supply; and the quality of the potatoes and abundant yield will satisfy any one who tries it. Besides, the articles are all good, and much needed by most of our soil.—*Vermont Farmer.*

Horses' Sore Breasts.—An exchange remarking on the chafing of the breast of horses, says: "The common practice of using pads of sheepskin under the collar is objectionable, especially in warm weather, because they accumulate heat and make the breast tender. A better way is to take a piece of thick and smooth leather, cut it out just the size of the collar, or a little wider, and let it lie flat on the neck and shoulders of the horse. This will be still and smooth on the horse's neck, while the collar itself moves about, and so it will prevent chafing. In addition to this let the breasts of working horses be washed off every night with clean water."

Greasing Axles.—On the authority of the *Carriage Monthly*, more injury is done to carriages and wagons by greasing too much than the reverse. Tallow is the best lubricant for wood axles, and castor oil for iron. Lard and common grease are apt to penetrate the hub, and work their way out around the tenons of the spokes and spoil the wheel. For common wood axles, just enough grease should be applied to the spindle to give it a light coating. To oil an iron axle, first wipe clean with a cloth wet with turpentine, and then apply a few drops of castor oil near the shoulder and end. One teaspoonful is enough for the four wheels. Carriages are sometimes oiled so much that their appearance is spoiled by having the grease spattered upon their varnished surfaces. When they are washed in that condition, the grease is sure to be transferred to the chamois from the wheel, and from thence to the panels.

The American Builder, in reply to an inquiry, says: "If your closets are damp and engender a mold which incases not only boots and shoes, but also other articles of wearing apparel, obtain half a peck of unslaked lime, and put it in a shallow dish in the closet, and it will absorb the dampness. When it becomes dry it should be renewed. A damp house, however, is a potent agent in producing diphtheria, neuralgia, and bronchial troubles, and no time should be lost in making the cellar damp-proof with cement, and the drainage from gutters and roofs should be attended to forthwith. Cases of this kind are frequent causes of disease and death in families where there is no good reason for such existing.

Watering Places for Stock along Shallow Streams.—A correspondent of the Ohio *Farmer*, Mr. L. D. Snook, suggests the following: At the point where the fence crosses the stream excavate a place in the bed of the stream sufficient to hold two or three barrels of water; when finished, drive in the ground a few feet apart and two feet from the fence, two posts or stakes, and leave them projecting eighteen inches. Upon the outside of these firmly nail three wide boards or two narrow ones. A watering place is also easily made for the accommodation of stock on the opposite side of the fence; or should the most desirable point for watering be away from the fence, then four stakes are driven in the ground at the point desired, and boards nailed on its side, forming a box with open top and bottom.

This plan prevents hogs from wallowing in the stream at the watering point, and horses that are in the habit of pawing in the mud and water can not muddy the drinking water for other stock.

Figs in the South.—A correspondent, Mr. O. Taylor, of Mt. Pleasant, Ala., writes: "Figs in Florida do not grow as figs in Smyrna, according to a writer in the PHRENOLOGICAL. They fruit to perfection here without the aid of man to fertilize them, and I do not believe

that the fig ever has the male and female on different trees. The blossoms are inside the figs, and all I ever saw are perfect. I have ten varieties at present on my place. The seed of foreign figs grows easily here, but no such figs as your writer from Smyrna speaks of ever grew from such seed, according to my knowledge; and as to an overdose causing the crop to fail, that is almost too big a dose for a pomologist."

MRS. C. FOWLER WELLS, *Proprietor.*
H. S. DRAYTON, A.M., *Editor.* N. SIZER, *Associate.*

NEW YORK,
OCTOBER, 1877.

TO MEET THE PUBLIC NEED.

THE aim which the publishers of the PHRENOLOGICAL JOURNAL have kept constantly in view, is to meet the popular want of instruction concerning the human mind and body. In the prosecution of this aim we have sought to adapt the form and character of our magazine to the taste and capacity of the masses, those who need most the instruction which relates to the care of the health and mental improvement. It is clear that popularity and cheapness are coördinate in literature; that high-priced books and periodicals do not find their way easily into the homes of those who are dependent upon the results of their daily labor for daily food.

To the mechanic and to the small farmer, with families surrounding them whose miscellaneous wants appear numberless, three or four dollars seems a large sum to be given for a magazine; and however much the reading matter thus procured in monthly installments may be prized, when the time approaches for the payment of the annual subscription, the amount required assumes proportions so great as to keep almost out of view the sense of benefit. In times especially when work is scarce and wages low, as at present, many an honest heart is pained by the conviction that the necessities of the household require the money which would otherwise be gladly sent for the old favorite, and the thought comes: "If it were a dollar less, I would have it again and try to make ends meet."

Several of our old subscribers have expressed views in keeping with this, and the contemplated reduction in price, which the reader will find more particularly noted in the publishers' department, is as much for the purpose of responding to such appeals as for promoting the dissemination of scientific truth.

When the price was advanced to three dollars, seven or eight years ago, all departments of industry were active, labor commanded very high rates of wages, and the masses had more money in their possession than ever before in the history of our Republic. In fine, three dollars then was much more easily obtained by the workingman, and by the merchant, than to-day. With such increase in price there was no falling off in readers; on the contrary, our books show an increase until the excessive prosperity of the country began to indicate a change, or rather to declare its want of a solid substratum. In reply to several inquiries, we will state that the scientific departments of the PHRENOLOGICAL will be maintained at the present standard, if not improved, and whatever change may be

made in accordance with the reduction in price, will affect mainly the miscellaneous reading. In biography we shall continue to be as full as at present, and contemplate no abatement of illustrated matter.

In times of depression, when vast numbers lack employment, and the general tone of the community shows a moral slackness, a natural resultant of industrial inactivity, it is most important that the literature of the people should be healthful in tone and supply wise counsel. If the people are then cheered and instructed, the day of better things will be hastened, and the community will be enabled to render its prosperity sure and enduring.

It is with an earnest desire to promote the movement toward an improved order of social and industrial affairs that the publishers have decided to reduce the price of the PHRENOLOGICAL, and to adapt it to the pecuniary status of the average citizen.

IS PHRENOLOGY WANING?

A CORRESPONDENT says: "I am often asked the question, How is it that there is not the same interest in Phrenology that there was some years ago?"

Answer: In the first place, it is not true, though to the casual observer it may seem so. When Phrenology was introduced it awakened the spirit of curiosity and astonishment, and also the spirit of opposition and ridicule. It was the last new thing. Everybody must have his say about it.

Some five-and-twenty years ago the subject of Spiritualism was projected upon the public attention, and it was talked about; it was railed at; people would run here and there to see about it; men took sides for and against it. To-day there is not a great deal of that noise, but the subject itself probably has more adherents than it had ten years ago.

We remember when the religious denominations called Baptists and Methodists were trying to gain a foothold in Western New England. There was but one denomination, the Congregationalist; and they looked upon all these new-comers as interlopers, and there was a general current of opposition to them, and any man or woman who would undertake to worship with either of those denominations was argued with or ridiculed, and mourned over or opposed. They could not get a public building to preach in, but had to worship in farmers' kitchens, barns, and forests. In those same old towns to-day the spire of the Baptist church has as tall a vane and as sonorous a bell as any of the others; the Methodist church stands erect amidst the elms and maples, and does not blush in the presence of the Congregational church; the respectable and wealthy people are about equally divided among the three denominations; and nobody to-day seems to think that to be a Baptist or a Methodist is to be an outsider. Consequently there is no noise made about it. Are Methodism and Baptism dying out in New England because there is no quarreling any longer about them?—no fuss, no noise, no confusion?

If a fountain should burst out in a hilly country it would go roaring, dashing, surging toward the valley. It would be turbid; it would be filled with brush and trash and floating débris of every sort. The stream would seem to quarrel with every hillock, bush, and tree. Go there ten years afterward and follow the stream through the valley toward the sea, and it would be found that the stream which once made such a disturbance had found a channel; had worn for itself a pathway; the water is clear; it runs deep and smooth; fish have found

their way up into it and rejoice in its cool deep places. The man who saw the fountain burst on the hilltop and listened to the rush, the roar and strife, would look in vain for his noisy brook and wonder if it was all dried up.

There are ten believers in Phrenology today where there was one thirty-five years ago. There is not such a strife to discuss the question. Men have it as a settled belief. They have seen its fruits and know them to be good. They are training their children by its light. Those who are now the teachers and firm friends of Phrenology, whose libraries are filled with its literature, and whose heads are rich with its ideas of self-improvement and internal mental growth, do not remember how their grandfathers quarreled over Phrenology and opposed it and laughed about it. There is a large representation in this generation of men who never had any skepticism on the subject of Phrenology. They accept its truths as they do the multiplication table, and have an idea that there are about as few mistakes made in the application of Phrenology as there are in the use of the multiplication table. Not a few people make some mistakes in figuring, and of course phrenologists are equally liable to make mistakes, though their principles and philosophy are sound.

CO-OPERATION--FINANCIAL AND INDUSTRIAL.

THAT was excellent advice which Senator Conkling gave in his short speech on the occasion of his return to Utica, from a European tour. He sketched the condition of the working classes of England and France, and indicated the great superiority of American work-people in point of rights, privileges, and wages, and deprecated the "madness" which had precipitated the outrages in connection with the recent railway strike. The Senator remarked, in this connection:

"We are all workingmen in America. No class has a monopoly of the right to call itself the working class here. I have always worked, and always been compelled to work, and my sympathies are all with honest labor. I believe in its dignity and in all its rights. But, when the tidings of the strike reached me in Paris, under my eyes was a spectacle which seemed to heighten the madness of what men in America were doing. The Government of France was borrowing money, and on the curbstone in the street, sat men all night to get each his turn in the morning to invest in the loan. They were workmen who, living as workmen do not and need not live here, and working for wages which American workmen would scorn, had, by hook or by crook, saved fifty francs each. Fifty francs make ten American dollars, and these all-night watchmen were there to buy a ten-dollar bond, on which they were to get four per cent. interest. There sat the workingman of France amid the luxury of the more fortunate, contented with what fate had sent him. Can it be that liberty and prosperity have spoiled any portion of the American people until they can not endure their share in a season of common adversity?"

This short extract contains many lessons for our study. The contrast which French industry presents with American is amazing. France, although impoverished by war and trade stagnation and the constant prey of political convulsion, yet finds in her population an unceasing devotion and an untiring energy. She wants money and invites the masses to contribute toward filling her treasury, and they respond with enthusiasm. Let our financial authorities take a hint or two with regard to interesting the public at large in the fiscal matters of the nation, and not entrust important loans entirely to wealthy syndicates whose policy seems to

be that of extending only to the rich and well-to-do the privilege of participation in them, while the men and women whose strong hands and ready hearts minister to all that is fundamental in the substantial prosperity of the country are excluded. Their few dollars each are beneath notice. Ten-dollar bonds would be too "small potatoes" for our high officials to handle!

Another very important lesson is that of the frugality of the foreign workman which enables him to meet and bear successfully the commercial crises which have so frequently marked the history of France in the past decade. The American workman has exhibited an unwilling spirit in adapting himself to the social and commercial changes which have been going on since the close of the late civil war. To be sure, all classes have sought to maintain the current of affairs at the high-tide which characterized the period of stimulation and inflation, notwithstanding the fact of its insubstantial and impracticable nature stared them in the face. The flavor or prestige of prosperity, however fictitious it might be, was too agreeable to be relinquished without a struggle. Even wise men turned their eyes from the condition which they knew was near and inevitable, and only when it had entered their counting-rooms and invaded their homes did they settle down grimly to a reckoning.

The many strikes, which have characterized all departments of labor since the commencement of reaction, have shown the hostility of the working people to contraction in the measure of wages in spite of the obvious lack of demand for the products of labor. The flush of industrial activity during the civil war and immediately succeeding it, awakened the American mechanic to a sense of the importance of his relation to the prosperity of society such as he had never before experienced, and the extraordinary wages paid for his services enabled him to command educational and social advantages such as he had never before known. It is not at all strange, then, that the intelligent and skilled artisan should be reluctant to return to old conditions, or that the ignorant workman should obstinately refuse his co-operation in the measures of re-adjustment.

But they forget, and it must be said that all classes appear to forget, that human happiness does not depend upon wealth as measured by dollars, but upon altruistic sympathy and frank co-operation. Whatever might be the times, "hard" or "good," if men and women, high and low, rich and poor, should regard each other with kindness, and candidly co-operate in the work of the factory, the store, the farm, each performing with honest readiness the part falling to him or her, there would be no occasion or room for strikes; a moral tone of such high character would grow out of this happy relation that the discontent and covetousness which engender industrial strifes would find no toleration in the community.

PHYSIOGNOMY TO ORDER.

NOTWITHSTANDING the testimony bequeathed to us by Homer, Theophrastus, Ecclesiastes, Plato, Aristotle, Aquinas, Lavater, Shakespeare, and a hundred others, to the effect that "a man is known by his countenance," it has become one of the provinces of modern art and science to manufacture or mold a feature somewhat in accordance with one's esthetic longing. Are there not skillful surgeons who hold themselves in readiness to furnish a lip or nose to them who lack a complete suit of facial elements? Do not these professors of osteoplasty cover up disfigure-

ments occasioned by wounds or disease with a deft manipulation which is scarcely short of the marvelous? Surely the golden age of physical symmetry and beauty is dawning.

But it is not essential that one having a nose set a little awry or inclined to deviate from a right line, and point either heavenward or earthward, should apply to the skilled osteoplaticist, whose charge gravitates upward in a manner rarely proportioned to the size of his patient's wallet; he can operate upon himself. A certain Monsieur Ross, of High Holburn, London, offers for his consideration, and for a consideration doubtless regarded as more substantial, a machine which Monsieur Ross avers, when "applied to the nose for an hour daily, so directs the soft cartilage of which the member consists, that an ill-formed nose is quickly shaped to perfection."

Ho, all ye crooked-nosed, behold your benefactor! Embrace this opportunity and be no longer subject to criticism, snubbing, ridicule, or reflection on account of your nose. Ye unfortunate, who carry one of the bottle order, whose varying tints of red are so conspicuous and embarrassing, retire from public notice for awhile and wear the wonderful machine in some sequestered nook and come forth reformed as regards your nose, and astonish your acquaintances by the adoption of an elegant Grecian proboscis in place of the disagreeable, swollen, red thing of the past.

Ye who possess an unseemly hump midway on the line of your nasal feature, put on the machine and try its virtue as a leveller, and be happy, as you find the hump taken down, in the reflection that while your friend of the "bottle" is indebted to the same kind apparatus for gaining a better reputation among his friends, your character for dominant mulishness has undergone a material reduction, and society regards you with a more lenient eye than before.

BRIGHAM YOUNG.

THE death of Brigham Young, on the 29th of August last, in his seventy-seventh year, will probably hasten the crisis toward which Mormon affairs have been working for some years. The Mormon system has owed its perpetuity and strength in the main to this man's extraordinary ability as a governor in matters civil and religious. In fact, from the time of his accession to the Presidency of the Mormon community, in 1847, to his death, he held the fortunes of his fellow religionaries in his hand, and in spite of the encroachments of other colonists and other religious societies, and notwithstanding the unfavorable attitude of the United States Government, he maintained the social and religious individuality of the Mormon community substantially unimpaired. He was a natural leader and organizer—a nation builder. Had he established his people in a country where they could have acquired the position of a separate, independent State, he would probably have founded a vigorous little nation. In his personal habits he was frugal and simple. He excelled as a judge of human nature and in the power of control. An unlearned man, yet he was able to build up a great, enterprising, and prosperous community, and to keep it always subordinate to his will. Take him all and all, Brigham Young was the most remarkable man of the century.

THE NEZ PERCÉS STRUGGLE.

THE everlasting Indian question is pressed painfully upon our consideration with the news of every encounter between the Government forces and the wild moun-

taineers; and the recent battle in which Colonel Gibbon was the commander, and in which twenty-five of his force were killed, and forty-five wounded, without any advantageous result, most earnestly bids us pause and think of the situation. For what purpose is all this waste of life? Far off in those mountains, brave men are led to be slaughtered by Indians, whose cunning and desperation render them most formidable foes. Is not this policy of chastising the savages a most costly one?

Mr. J. W. Nesmith, at one time Superintendent of Indian Affairs, says of these people:

"They are the finest specimens of the aboriginal race upon this continent, and have been friendly to the whites from the time Lewis and Clark visited them up to the inauguration of the present outbreak. From a kind, docile, friendly people, the mismanagement, frauds, and downright robbery perpetrated by the general Government and some of its rascally representatives, have driven them to take up arms, and converted them into a fierce, dangerous, and relentless enemy."

The thirst for gold, which has ever been a dominant cause of strife and bloodshed in nations and families, has brought about the present conflict, and from all appearances ere it is ended there will be many houses of mourning in the land.

We have been told by eminent Western missionaries, and by men who have lived among the Indians for years, that they have not committed outrages on white settlers until driven to extremity by encroachments upon their rights, and that in the case of the Nez Percés the Government is responsible for arousing their savage instincts by pursuing an unjust and vicious policy in dealing with them.

OCTOBER CLASS, 1877.

ON the sixth day of the current month the Autumn Session of the American Institute of Phrenology will be opened. The prospects for a large class are good, still there will be room for any who may decide, even at this late day, to become members. The reduction of the price of tuition to seventy-five dollars, thus leaving the student twenty-five dollars, which will nearly cover the cost of board for the term, acts as an inducement to attend the Institute this year.

Students who graduate this fall will be able to enter the field, so as to reap the benefits of the best of the lecturing season. Those who contemplate entering at this term, should endeavor to be present on the day of opening. Circulars giving full particulars of the course sent by first mail, on application to S. R. WELLS & Co., 737 Broadway, N. Y.

ALVIN ADAMS. — Among the notable men who have lately died is Mr. Alvin Adams, the founder of "Adams' Express." The enterprise and success of Mr. Adams were most remarkable. In 1840 he was not worth a dollar, but by skillful business management he became immensely rich. When he first began to carry parcels and letters between Boston and New York there was no railroad, and upon the completion of the New York and New Haven Railroad, he formed a partnership, and contracted to pay the railway $1,700 a month for the privilege of carrying small packages by their road. The next step was to carry freight, and then followed the establishment of agencies and the extension of the business over nearly the whole country. His hospitality was generous, and his splendid home at Watertown, Mass., was almost a public resort.

Our Mentorial Bureau.

[In this Department will be noticed such matters as are of interest to correspondents and to the general reader. Contributions for "What They Say" should be brief, pointed, and creamy, to secure publication.]

To Our Correspondents.

QUESTIONS OF "GENERAL INTEREST" ONLY *will be answered in this department. But one question at a time, and that clearly stated, must be propounded, if a correspondent shall expect us to give him the benefit of an early consideration.*

IF AN INQUIRY FAIL TO RECEIVE ATTENTION *within two months, the correspondent should repeat it; if not then published, the inquirer may conclude that an answer is withheld, for good reasons, by the editor.*

WE CANNOT UNDERTAKE TO RETURN UNAVAILABLE *contributions unless the necessary postage is provided by the writers. In all cases, persons who communicate with us through the post-office should, if they expect a reply, inclose the return postage—stamps being preferred. Anonymous letters will not be considered.*

ULCERATED TOE-NAILS.—The trouble you speak of is painful enough, and occasioned through the common practice of wearing tight shoes or boots. If the trouble is of long standing it is difficult to treat, and will be found somewhat obstinate. We do not altogether favor surgical operations, yet some chiropodists advise the extraction of the nail. We think the better way is to apply cold water compresses, and regulate the diet so as to keep the blood pure and clean. Dr. Meigs, of Philadelphia, advises the nail to be scraped (mainly in the center, so as to induce a tendency of growth upward on both sides), and then introduce under the angle of the sore side soft lint, filling in this way the space between its edge and the flesh. Over this may be placed a water dressing. Until the inflammation has been entirely reduced, and there is progress toward healing, of course a very loose shoe or slipper should be worn.

READER, who asks how an injury of some of the bodily organs can be represented on the skull, is informed that the answer is not adapted to a public journal.

HEADACHE.—A rush of blood to the head gives pain and uneasiness, and if the brain be very active, the head may increase in size, or at least become very sensitive to the pressure of the hat. Avoid coffee, spices, sugar, tobacco, and eat liberally of fruit to keep the liver active, and oatmeal and Graham-flour bread and cracked wheat to keep the bowels free, and sleep abundantly.

WHISPERING confidentially to one who is listening, or lowering the voice when no third person is near or within possible hearing, is the result of large Secretiveness and Cautiousness.

INFLUENCE OF SHAKESPEARE.—This great dramatist occupies his high position in the intellectual world because he has played with a masterly touch upon "the harp of a thousand strings." Scarcely any emotion or passion or feeling common to the human mind can be mentioned which Shakespeare has not in some way represented or impersonated; so the careful study of his works will have an influence in awakening the general activities of the mind. Were we asked what organs particularly were brought into exercise, we would specify the organs generally of the intellect, besides Ideality, Constructiveness, Spirituality, Destructiveness, Friendship.

FATALITY.—A correspondent possessing considerable intelligence propounds several questions which embody the old, old objection of fatality or materialism. Phrenology does not assume any responsibility for what it discovers as a science in the organization of man; no more than chemistry or geology assumes responsibility for the existence of the elements they find in the rocks. These things are so, says our science, but she does not stop there. She goes further, and with the missionary's generous thoughtfulness counsels improvement. On the authority of Holy Writ, as well as of Phrenology, we can say that each man has a certain measure of moral capacity inherent in his organization. "To each one of us is given favor (grace) according to the measure of the gift of Christ (God)." Need we refer to the parable of the talents, which illustrates forcibly the same principle? Man's responsibility is coördinate with his organism. The poor fellow who had but one talent was not punished for having but one talent, but for being delinquent in its use. We meet with men every day who apparently possess in the outset but one talent, but who by an energetic use of it, instead of supinely sitting down in the mire and bemoaning their fate because of having so few intellectual and moral qualities, have become even distinguished; keeping their eye set upon some one object, they have plowed steadily toward it, and finally attained real excellence. Men of the stamp of Mr. Huxley insist that they

owe their proficiency in science to hard work, not to any special gifts of nature. For our own part we do not perceive any remarkable endowment in such men. They are not brilliant, but they are steady, persistent, thorough-going. Phrenologists will not recognize or propagate any doctrine which they do not deem well founded. They will not recognize fatalism, as they believe that their observations do not sustain it. On the contrary, the Phrenological doctrines thoroughly demonstrate human progression. We have been the means of bringing encouragement and joy to many desponding, downcast souls; despondent and downcast because of the gloomy influence of fatalistic reflections. We think that our profession should contribute toward this enlightenment and cheerfulness. You are not sufficiently read in the subject to understand the practical application of phrenological principles. A full appreciation of their comprehensiveness would relieve you of many of the doubts which you now entertain.

GREAT BRAINS.—*Question:* Will you please insert in the JOURNAL the names of a few persons noted for large heads and heavy brains, and the size and weight of the same?

Answer: Among those, the capacity of whose brains have been recorded, are Cuvier, the great French naturalist, sixty-four ounces; Dr. Abercrombie, sixty-three ounces; Webster, sixty-three ounces—estimated.

A VEGETARIAN GROUP HOME.—The communication which was published in the PHRENOLOGICAL JOURNAL a few months ago, with this title, has awakened considerable inquiry. Will the writer of that communication send us again his address?

COMPARISON AND SPIRITUALITY.—Careful observation of physical objects and the estimation of their qualities and characteristics will assist toward rendering active the organ of Comparison. The reading also of literature which is largely made up of statistical argument and illustration will contribute toward such activity. With reference to your spirituality, study religious subjects, the entertaining of religious habits, and the performance of Christian work will help. The reading of literature of a high-toned moral stamp will prove a powerful aid; such poems as Pollok's "Course of Time," Bickersteth's "Yesterday, To-day, and Forever," are admirably fitted for awakening moral sentiment.

SPOTS ON THE NOSE.—The dark spots you allude to are occasioned by deposits of effete matter. Render your diet as pure as possible. Use water freely in the way of bathing, and do not be rash in rubbing and scraping your face, particularly the nose, and you will find that in the course of time nature will improve your appearance. Many people, by squeezing and pinching and rubbing, make matters worse, sometimes establishing a permanent state of disease.

HEADS OF MILITARY MEN.—Soldiers of eminence are largely endowed with Destructiveness, Constructiveness, Combativeness, Caution, force of character in general, and large perceptive faculties. General Grant's chief characteristics are self-poise, persistency, executive ability. General McClellan possesses perhaps too much Cautiousness. Benedict Arnold was a man of fine intellectual capabilities, but had excessive sensitiveness, large Approbativeness, and scarcely enough Conscientiousness.

SOMNAMBULISM.—The phenomena of somnambulism indicate peculiar mental possibilities in man. The fact that the sleep-walker forgets on awakening the circumstances of his somnambulistic adventures points to the possession of double consciousness—a property which has not yet been thoroughly explained. The composite nature of the mind has, of course, a special bearing on it. In dreaming, few faculties are awake and in exercise, hence the inconsistencies which are presented. In somnambulism there may appear a remarkable balance of the faculties which enables the subject to do things which he would not attempt in his normal state.

ECZEMA.—J. T. M.—We think that the substances which you have swallowed for the relief of the eruption have not been beneficial. It would be better for you to adopt a pretty thorough hygienic course of diet. An occasional Turkish bath would be of much help in relieving the system of the morbid matter which now appears as an eruption. Eat plenty of fruit. If there be any tendency to typhus fever in your family, by all means shut down upon flesh diet for a time, until the typhoid taint has been eradicated.

BRAIN WORK.—X. Y. Z.—We can scarcely answer your question. Constitutions vary so much that what would be severe exercise for the faculties of one might be simple and easy to another. People become accustomed in the course of time to what at first appeared very severe and difficult. Men who are accustomed to writing as authors are able, after years of practice, to write almost automatically. The faculties become so thoroughly co-ordinated they work with little friction, and supply the brain-material requisite on the slightest call. Of course there are some sorts of brain labor which are more exacting in their demands upon the strength than others. We think that the short-hand writer, one who attends upon trials at court, or to the business of an enterprising newspaper, performs very exhaustive work. So, too, the editor of a newspaper who is compelled to furnish a certain

amount of matter for publication every day, often experiences weakness and lassitude because of exhausted vitality. Then, too, the lawyer, in the prosecution of an important case which occupies his mind days and weeks without relaxation, sometimes gets broken down. Any routine, in fact, becomes wearisome when protracted beyond what is reasonable. As a rule, that employment which exercises at the same time the largest number of faculties is the most exhaustive.

SAGE TEA.—We do not see the necessity for drinking such a preparation. If you *must* drink tea of some sort, this, prepared in a mild form, probably would not be specially injurious.

SALT.—*Question:* Why is it that a person often on refraining from salt for a day or two feels weak?

Answer Some persons experience a degree of stimulation from eating salt, just as people who are accustomed to the tobacco or alcohol habit feel nervously disordered or unstrung for a time if they relinquish the practice. As a general thing, however, salt is not regarded a stimulant. It is an alkali, and rather harmful in the carthy shape in which commerce furnishes it.

EGOTISM.—How do you distinguish the apparent egotism arising from the selfish propensities from that given by Self-esteem?

Answer: Self-esteem gives a quiet dignity and a sense of personal prerogative and merit. This feeling is not in itself aggressive. When it combines with appetite in man or animals, it assumes the best food or the best place to feed. Where it combines with the desire for property or office or for the possession of a beloved object, Acquisitiveness, Approbativeness, or Amativeness stimulate Combativeness and Destructiveness to vindicate the claim and thus the egotism of Self-esteem may assume an animal appearance. The action of mere animal propensity is a rude, bullying force; and these forces acting under predominant Self-esteem, become elevated and dignified. It may not always be easy to discriminate between the action of combined faculties; but it often may be done very clearly.

ORGANS IN PAIRS.—If the mental organs are in pairs, one in each hemisphere of the brain, why can not the side which is not injured carry on the work of the organ when an injury has occurred on one side only?

Answer: It can, and does, in numberless instances. In hemiplegia, or paralysis of one half or one side of brain and body, the functions are carried on by the uninjured side, though perhaps less vigorously than if both sides were in health. One eye can do the seeing, but not so perfectly as both. Inflammation of an organ in one side of the brain may produce an exalted action of the faculty, or even insanity, while the organ on the other side of the brain is in healthy condition.

What They Say

MENTAL AND PHYSICAL EMANCIPATION DEMANDED.—A correspondent residing in Staffordshire, England, writes thus of the PHRENOLOGICAL, to which he is a subscriber: "When such a journal as that becomes well circulated through the world, I am sure victory over drunkenness and ignorance and false teaching will be the result. I know that I shall never be as tough and enduring as I ought to be, owing to dyspepsia; but through your teaching I have come to see daylight, and I shall fight my enemies, who have shorn me of my health and strength, to the last. I long to see the drug-doctor system come to an end. Oh, the injury which I have experienced from it! and I see hundreds around me who will never be more than subjects for the doctors. While in America last year I called at your office and had my head examined. It was really wonderful how correctly my character was read. I subsequently sent for the 'Mirror of the Mind,' and all who know me when they read that can see my true character much plainer than before."

RENEWING THE CURSE.—Dr. Benjamin Rush, in his lecture on Intemperance, says that most drinkers deprave their tastes by tobacco before falling into the constant use of intoxicating drinks. In 1828, having then removed to Philadelphia, an old gentleman from Reading told me that when a young man all the land from Philadelphia to that city had become so poor from the culture of tobacco that nothing would grow upon it except, perhaps, mullein stalks and cinquefoil, until it had been redeemed with plaster of Paris and clover seed, and when the latter was in bloom it was plowed in and the land reclaimed and rendered fertile as it is at the present time. Just now the Agricultural Society of Berks County has offered a thousand dollars premium for the best acre of tobacco that shall be raised in the county. Townships which border on Maryland were made desolate by tobacco culture. Many years ago I knew a blooming girl from the country, in whose complexion the rose and lily were charmingly blended, and who had the finest blue eyes I ever beheld. Necessity compelled her to labor in some industrial line, and she found a place in a cigar factory. One year from that time her skin underwent a change, became tawny, and her face grew thin, and her very eyes assumed a tobaccoish hue. Fortunately for her, however, she found relief from her injurious occupation and soon after married a farmer. She did not long enjoy the change, for the tobacco poison had become rooted in her system, and brought forth its destructive fruit in the course

of a few year, rendering her insane, and she was for some time confined in an asylum.

M. W. HAMMOND, M.D.

INDECISION OF CHARACTER.—Of the many causes which hinder men from attaining success, indecision is undoubtedly one of the greatest. Without any determined course marked out for themselves, the majority of young people set out on the great ocean of life, depending more upon chance than any fixed law, whereby a definite result may be obtained. Thinking to-day, perchance, to amass a fortune in some pursuit, they, to-morrow, easily change it for some other. And so they spend their lives, continually varying, always discontented with the present, and ever looking to the future for brighter days, which their indecision does not warrant them to expect. How many young men there are, who if settled in their purpose of obtaining a livelihood, would ultimately be crowned with success. How many old men there are, who if they had not lightly and frequently changed their vocations, would now be in the enjoyment of happiness and every comfort, whereas their latter days are embittered by want and penury, and their home the work-house or asylum. It is the curse from which no one is exempt, that "man shall earn his bread by the sweat of his brow." Such being inevitably the case, let us not be over-fastidious as to the nature of our employment, provided it be honest.

If we feel dissatisfied with our lot (which in fact we all do, the king as well as the beggar), let us nobly and manfully endure it, and console ourselves with the pleasing certainty that soon all our toils and troubles and privations will end. Let us not too readily try to divest ourselves of the weight Providence has burdened us with. Whatever our condition or state in life be, let us discharge its duties, and if we calmly submit to the All-wise Creator's good will, rest assured our allotted span will be more happy and less troubled than if we day after day seek an evasive means of obtaining that which Crœsus, with his fabulous wealth, could only possess—a living.

W. W. MEAGHER.

SURROUNDING INFLUENCES AND CHARACTER.—It is seemingly thought, or at least asserted by certain individuals, that every person is merely the result of chance; that there are no natural laws governing our existence; that we are simply what we happen to be; and that if a person is gifted with only moderate powers, it is foolish to believe he can outgrow this dwarfed state through cultivation. This idea of human nature seems to me not in harmony with sound reasoning. Now suppose we plant two hills of corn in the same soil, and cultivate each with the same general care. In this case we have no reason to believe there will be any difference between these two hills in their final yield of grain. Now let us suppose that these two hills of corn come up; that one soon has large, thrifty stalks, and the other, from some cause, looks as though it was laboring under general debility. If we utterly neglect the one that is now prosperous, and at the same time make every possible effort to restore the other, have we not reason to believe that the latter will finally outstrip the former? Any well-informed farmer will tell you that under these circumstances the chances are greatly in the latter's favor. That small tree growing in your garden may be trained to grow in any direction you wish. So, that little son or daughter will be likely to grow up and live in accordance with early influences. But I believe that there is sometimes an exception to this rule. There are those whose dispositions to do right are so strong that they will conduct themselves properly in spite of all the evil influences that can be brought against them; but in such persons there is something rather out of the course of human nature—something nobler and better. Let not parents imagine their children by nature so perfect as to neglect giving them the proper moral instruction. And above everything else, set good examples; for children are pre-eminently liable to imitate. Teachers everywhere should pay no more attention to the education of the intellect than to the education of the moral nature; for without morality, human life is in reality a failure. And as all of us exert more or less power over our fellow-creatures, let us see that our influences may lead to some good.

LOWE.

WISDOM.

"Think truly, and thy thought
Shall be a fruitful seed."

WHAT is the best thing to do in a hurry?—Nothing.

THERE is nothing that binds heart to heart so quickly and safely as to trust and be trusted.

MUCH of the charity that begins at home is too feeble to get out of doors.

THEY are generally better satisfied whom Fortune has never favored than those whom she has forsaken.—SENECA.

WHILE passions and minds are agitated, the fewer opinions we deliver before them the better.—LANDOR.

LIGHT makes music, in its passage playing on the visible and the invisible harp-strings of the universe.

TRUE temperance is the proper use of good things and the *total abstinence* from bad ones.

In speaking of a person's faults,
Pray don't forget your own;
Remember, those with homes of glass
Should seldom throw a stone.
If we have nothing else to do
But talk of others' sin,
'Tis better we commence at home,
And from *that* point begin.

THE table of life is abundantly supplied. If we don't eat so fast, it will taste the better; if we don't eat too much, we shall be better nourished; if we don't snatch, there will be enough for all.

"IF you want to make the bulk of men wiser do not put books into their hands which they will either throw away through indifference, or must drop through necessity; but give them employment suitable to their abilities, and let them be occupied in what will repay them the most certainly and the best."—PRES. DUPATY.

MIRTH.

"A little nonsense now and then
Is relished by the wisest men."

"BABIES, after having taken one bottle of my soothing syrup, will never cry more," says a celebrated compounder of soothing syrups.

"ARE you lost, my little fello[illegible]?" asked a gentleman of a four-year-old one day in Rochester. "No," he sobbed in reply; "b-but m-my mother is."

A BOY was asked what trade he preferred to follow. "Well," said he, "I guess I'll be a trustee, for ever since father has been a trustee, I've noticed we always get pudding for dinner."

A LITTLE girl said to her mamma, "Mamma, have you heard of the man that got shot?" "No, my child, how did he get shot?" asked mamma. "Oh," said young precocious, "he bought 'em."

SOME men can never take a joke. There was an old doctor, who, when asked what was good for mosquitoes, wrote back: "How do you suppose I can tell unless I know what ails the mosquito?"

LAVENDER was aroused in the middle of the night by his wife, who complained that she heard a noise. "What does it sound like?" said he. "It sounds like something ticking," said she. "It's probably the bed-ticking," he murmured, and went off to sleep again.

"WILLIAM," said one Quaker to another, "thee knows I never call anybody names; but, William, if the Governor of the State should come to me and say, 'Joshua, I want thee to find me the biggest liar in the State of New York,' I would come to thee and say, 'William, the Governor wants to see thee particularly.'"

Library.

In this department we give short reviews of such NEW BOOKS *as publishers see fit to send us. In these reviews we seek to treat author and publisher satisfactorily and justly, and also to furnish our readers with such information as shall enable them to form an opinion of the desirability of any particular volume for personal use. It is our wish to notice the better class of books issuing from the press, and we invite publishers to favor us with their recent publications, especially those related in any way to mental or physiological science.*

THE PUBLISHERS' TRADE LIST ANNUAL, 1877. Preceded by the first provisional supplement to the "American Catalogue," and the American Educational Catalogue for 1877, with a sketch and portraits of the Harper Brothers. New York: Office of the Publishers' Weekly.

This ponderous volume is an acceptable one to us, as it is to all who are related to the book trade. Since the beginning of the series, five years ago, much progress has been made in the arrangement of the publishers' lists, which comprise its contents in the main; and other features of peculiar interest have been added in the issues of the past two or three years, which have enhanced the Annual's value.

In this edition the general lists are not only more complete, but a fresh element has been introduced, which will be appreciated by all booksellers and book-buyers, viz., the Reference List, or American Catalogue.

The sketch of the Harper Brothers is a fitting testimonial to a great business firm and brotherhood, and finely illustrated by the superb steel portraits.

PAPERS READ AT THE FOURTH CONGRESS OF WOMEN, held at St. George's Hall, Philadelphia, October 4, etc., 1876. History of the Association for the Advancement of Woman.

An interesting compilation. Several of the articles are quite masterly in their treatment of the topics selected, and they are not all of the special *woman* character. A considerable amount of practical information concerning Education, Home Management, Co-operation, Social Morality, is accumulated in these papers, and no one can read them without profit, and the impression that there are among us earnest, thoroughgoing, studious women whose influence will be productive of good to society.

The document may be procured by addressing Mrs. S. J. A. Spencer, Washington, D. C.

PERSONAL APPEARANCE AND THE CULTURE OF BEAUTY, with Hints as to Character. By T. S. Sozinskey, M.D., Ph.D. 12mo, pp. 196. Philadelphia: Allen, Lane & Scott.

One might think that we had treatises enough on this subject. Certainly there are enough of the type represented by the warm book prepared by the once well-known Lola Montez. This new volume, however, finds a fresh field in a philo-

sophical consideration of the questions relating to the subject of beauty. He is learned, citing the *dicta* of ancient and modern authors as occasion may appear to warrant. In fine, we think that the reader is more conspicuous in his pages than the observer. In the Introduction our doctor of philosophy speaks of its being the practice nowadays "to go to some trouble and expense to improve the mind," while the body is "virtually allowed to take care of itself, its well-being is left to chance." Some regard to the ladies and gentlemen of society, and some inquiry at the drug-stores, would show emphatically enough that the "arts of beauty" are much practiced. The cultivation of appearances is carried to an absurd extreme in some classes, as any one who has ever visited Newport or Saratoga must know. But if our author mean that the masses neglect important hygienic and physiological means for the improvement of their bodies in a substantial manner, we must agree with him. We are told in the course of the volume that health is a basic element to beauty—Homer, Broussais, Mrs. Sigourney, Galen, and others being cited to sustain the proposition. In the chapters devoted to particular features—the nose, eyes, teeth, hair, etc.—some good suggestions are given with reference to their care; but now and then some drug compound is prescribed, which can not obtain our ready sanction, however much it or similar preparations have medical sanction. As a whole the book exhibits care in the preparation and a cultivated literary taste.

PUBLICATIONS RECEIVED.

THE MONTHLY WEATHER REVIEW FOR JULY, from the office of the Chief Signal Officer, U. S. War Department.

MONTHLY REPORT OF THE KANSAS STATE BOARD of Agriculture, for July, 1877. By Alfred Gray, Secretary.

DITSON & CO.'S MUSICAL MONTHLY—No. 4. Contains six select compositions. Price, 25 cts.

THE LOCUST PLAGUE IN THE UNITED STATES. By Chas. V. Riley, M.A., Ph.D. Chicago: Rand, McNally & Co. Will be considered at some length in our next number.

FAMILY RECORDS: their Importance and Value. By William Frederic Holcombe, M.D., of New York. A vigorous plea, reprinted from the "New York Genealogical and Biographical Record."

LECTURES AND ESSAYS. By Virgil W. Blanchard, M.D. The subject of this pamphlet is what is termed "Food Cure." It seems necessary nowadays to impress upon the public mind the necessity of selecting good food, so loose and reckless have people become with regard to what should be a subject of their most earnest consideration.

POPULAR SCIENCE MONTHLY SUPPLEMENT—No. 5. Price, 25 cts. D. Appleton & Co. We are of opinion that we get the richest kernels in these "Supplements." The selections are generally excellent.

VICK'S FLORAL GUIDE, No. 4, for 1877. Neatly printed and handsomely illustrated, as is usual with all Mr. Vick's typographical issues.

HEALTH IN THE SUNBEAM; or, the Blue-glass Cure: containing Practical Observations on the Remedial Value of Sunshine. By Ed. B. Foote, M.D. Some testimony on the efficacy of sunshine in the treatment of disease.

A CASE OF ABDOMINAL PREGNANCY treated by Laparotomy. By T. Gaillard Thomas, M.D. From Vol. I. Gynecological Transactions. New York.

THE SCIENTIFIC BASIS OF DELUSIONS. A New Theory of Trance and its Bearings on Human Testimony. By George M. Beard, A.M., M.D. G. P. Putnam's Sons, Publishers.

GOOD TIMES—monthly. A new candidate devoted to School and Temperance Literature. Mrs. M. B. C. Slade, editor. Fall River, Mass.

THE COLLEGE TELL-TALE. A lively folio of eight pages, published monthly, by the students of Packard's Business College. New York.

THE ARMY OF PROGRESS; an Earnest Appeal for Unitary Association. By G. H. Kreider, of Richmond.

STATE REGULATION OF VICE. A paper read at a conference in the parlors of the "Isaac T. Hopper Home." By A. M. Powell. Price, 15 cts.

THE ANGLO-AMERICAN PRIMER. Deziend tu teech a proper Speling and Pronunsiashun ov the English Langwej, and tu serv az a direct gied tu the reeding ov ordinery English print. By Elieja Boerdman Burnz.

CATALOGUE OF THE STATE AGRICULTURAL and Mechanical College of Texas. College Station, Brazos County, Texas.

UNIVERSITY OF THE CITY OF NEW YORK—Law School—1877-1878. An Explicit Circular of the Course of Lectures and Studies.

NEWSPAPER ADVERTISING—112th edition—containing a complete list of all the towns in the United States and the Dominion of Canada having a population greater than 5,000, together with names of the papers having the largest circulation, etc., etc. New York: Geo. P. Rowell & Co. A handy compilation for the business man and advertiser. Price, 25 cts.

THE DRUGGIST'S CIRCULAR—current numbers. Valuable to all concerned in this important trade, and to pharmacists particularly.

FIFTH ANNUAL REPORT OF THE BOARD OF HEALTH of the City of Boston. Very full, and containing much sound hygienic information.

LECTURES ON PHRENOLOGY

TO

Lyceums, Societies, Schools, Colleges, Individuals, etc.

Calls having been received for PHRENOLOGICAL LECTURES in different parts of the country,

The American Institute of Phrenology

has arranged to respond to these calls by furnishing able and popular Lecturers wherever desired, either for Single or Course Lectures. These Lectures will cover a great variety of topics in connection with Phrenology, and may be either popular or scientific.

LIBERAL TERMS will be made, the cost depending on the distance from New York, and the revenue coming from this source will become a part of the fund of the INSTITUTE for the purpose of its permanent establishment. Friends of the INSTITUTE should take such steps as will secure a Course of Lectures in every neighborhood. Full particulars will be sent on application to

S. R. WELLS & CO., 737 Broadway, New York.

NEW BOOKS ON HEALTH.

THE

Mother's Hygienic Hand-Book

For the Normal Development and Training of Women and Children, and the Treatment of their Diseases with Hygienic Agencies. By R. T. TRALL, M.D. 12mo, cloth, price $1. Fine edition, $1.25.

The great experience and ability of the author enables him to give just that practical advice which mothers need so often all through their lives, and this will be found by far the best work on the subject yet published. It covers the whole ground, and, if it be carefully read, will go far towards giving us an "ENLIGHTENED MOTHERHOOD." The work should be read by every wife and every woman who contemplates marriage. Mothers may place it in the hands of their daughters with words of commendation, and feel assured that they will be the better prepared for the responsibilities and duties of married life and motherhood. It is a fact that, other things being equal, the Diseases of Women and their infants are in direct ratio to the unhygienic habits of the mothers; and, this being the case, how important it is that the knowledge contained in this book should be widespread. Physicians, and nurses, and all who have the care of women and children, whether in health or disease, should read the **Mother's Hygienic Hand-Book.**

Digestion

AND

Dyspepsia.

A Complete Explanation of the Digestive Processes, with the Symptoms and Treatment of Dyspepsia and other Disorders of the Digestive Organs. Illustrated. By. R. T. TRALL, M.D. Bound in Muslin, price $1.00.

This Book constitutes by far the best work on the subject ever published. With fifty Illustrations; showing with all possible fullness every process of Digestion, and giving all the causes, and directions for treatment of Dyspepsia, a disorder which, in its various forms, is the cause of nearly all the diseases from which the human race is suffering.

"DR. TRALL, the author, has for years enjoyed a wide reputation as a writer upon Hygiene as well as upon health topics generally. He is a clear, forcible, and thoroughly informed writer."—*Inter-Ocean.*

"The invalid will find valuable hygienic hints in this volume."—*Cincinnati Daily Gazette.*

"The book contains much valuable information and sound advice."—*Chicago Advance.*

S. R. WELLS & CO., Publishers, 737 Broadway, New York.

AN IMPORTANT ANNOUNCEMENT.

Price Reduced for 1878.

In consideration of the continued hard times, and wishing to increase a knowledge of and interest in Phrenology and Health Reform, it has been deemed best to reduce the subscription price of

The Phrenological Journal

FROM $3.00 TO $2.00 A YEAR.

The size of The Journal must of necessity be reduced somewhat, but this change will not be in proportion to the reduction in price, while the quality of reading-matter, scientific and miscellaneous, will be more than maintained. Each of the several important departments will be retained, and no expense spared to make The Journal the best and most useful publication for general circulation.

This REDUCED PRICE will place it within the reach of all, and will result in a greatly increased list of subscribers; and, as an incentive for immediate subscriptions for 1878, we offer

3 Months Free to New Subscribers for 1878.

That is, all subscriptions received now, with the new subscription price, will be entered for the October, November, and December numbers of this year FREE; thus giving The Journal in the $3.00 form THREE MONTHS FREE.

In order to introduce The Journal more widely for 1878, to new readers, and believing that it needs only to be seen to be appreciated, it is decided to offer it to new subscribers for three months

ON TRIAL FOR 25 CENTS.

Names should be sent in at once, and the numbers of The Journal will be sent regularly.

AGENTS WANTED to canvass for The Journal. Liberal Cash Commissions given, or choice from liberal Premiums; and at these reduced rates large lists of names should be obtained by every canvasser.

Send for Terms, and address all orders to

THE PHRENOLOGICAL JOURNAL AND LIFE ILLUSTRATED.

VOL. 65. 1877.

NUMBER 5.] *November, 1877.* [WHOLE NO. 467.

GEORGE W. McCRARY, SECRETARY OF WAR.

OUR troubles with the Indians of the Black Hills, and with Mexico on account of the desperadoes who encroach upon our Texan border, have brought into special prominence the military strength of the nation, and consequently he who controls

the Department having in charge the movements of our forces is a subject of much discussion. It is certainly appropriate that he be introduced to the public through our columns.

The portrait of this gentleman indicates health, strength, momentum, endurance, and that kind of vital power which furnishes material for the efforts demanded of brain and muscle. He does not look care-worn, jaded, or wearied, but as if he had vitality enough to furnish all the motive force for any effort which he might be called upon to make; and that there would be a surplus of power, as it were a balance in the bank after paying all claims. The fullness of the face outward from the nose, and also outward from the mouth, indicates excellent breathing power and digestive power—in one word, vitality. Those who are sharp and thin, often have a great deal of mental capacity, but find it impossible to give that sustaining force to the brain which is necessary for the maintenance of a high order of labor. Thomas H. Benton could make a speech in the Senate every day for thirty years. He could stand in the middle of a circle of fierce and vigorous opponents, and like a bear bayed by dogs, could fight right and left, and come out of the struggle unwearied, while some thin men with larger brain and wider range of thought, and more of culture than Benton had, could make a brilliant effort now and then, only once or twice perhaps, during a session of the Senate. Mr. Benton was ever fresh because he had a Niagara of vital power to back up any effort, physical or mental, which he felt called upon to make. The organization now under consideration has not so much of toughness and hardihood as belonged to Benton, but he is more genial, mellow, pliable, and adaptable; is not so dogmatic in his spirit, not so fond of controversy, has not so much base of brain about the ears to give propelling force as the late eminent Senator.

This is a smooth working organization. He will do a great deal of mental labor without much friction or fret or worry. When he speaks to subordinates, his voice does not carry a harsh, dogmatic, overbearing spirit. He is quite as decided in his spirit as Benton was, because he has large Firmness and Conscientiousness; but he does not exercise his power through Combativeness and Destructiveness. His commands do not seem to carry a threat, though they carry influence. His requests are potent. He does not worry people, nor excite their antagonism. As a lawyer, he would make a jury feel kindly inclined toward him and his cause, and with his large Language, he would be an excellent speaker.

He has a good memory, and acquires knowledge readily; is clear-headed, and carries his knowledge where he can use it. He has the power of analysis, and good common sense; is more a critic than a logician. He understands motive, appreciates character, reads men at sight, and knows how to carry himself toward them in a smooth and persuasive manner. He gets better service from men than is common under similar circumstances. People are willing to do things that are inconvenient for his sake. If he employed men to work for him, they would not study to see how little they could do, but rather how well they could perform their duties, and how well they could please him.

He inherits his mother's quick knowledge: the intuitive way of reaching truth comes from that side, and he is more like her than the father in intellect. He is orderly, inclined to systemize everything; describes what he knows clearly, and makes himself always understood. He is ingenious; finds out the quickest, easiest, and cheapest way of

attaining ends. He is generous in his spirit, respectful in his manners, reverential toward the Deity, honest in his purpose, true, just, and upright, and very firm. He has a rather independent spirit; is not overstocked with the love of praise, and if thrown into the shadow of unpopularity wrongfully, he stands his ground, faces the world, and thus bears on to success.

We judge that his social nature is strongly marked, that he has many friends, that he is decided in judgment, and firm in his decisions; is adapted to practical details, nothing escaping his attention. He is a critic of everything, and remarkably well-informed, taking his opportunities as they have been. He will always be a student, always be hungry for knowledge; will never feel that his edifice of information is complete.

He is frank to a fault; open-hearted; dislikes men who are tricky and secretive, and unduly reticent. Ne never springs surprises and traps on people. He tells what he wants in plain language, and drives directly to the objective point.

Here is a healthy and vigorous brain amply sustained by one of the best of physical constitutions, and if he will live moderately, avoid nourishing the system too much so as to produce a plethoric condition, he will be likely to hold on to a good age, and be young in feeling and manner at seventy-five.

This gentleman is the youngest of the Cabinet officers selected by President Hayes. He was born on the 29th of August, 1835, in Evansville, Ind.

Soon after his birth his parents removed to Wisconsin Territory, settling in that part of it which afterward became the State of Iowa. He worked upon the farm for several years, and saved enough money from his earnings to attend a Western academy, where he studied for some time. He had been industrious and prudent in the use of his opportunities to obtain information, so that at nineteen he possessed a fair education. He aimed to be a lawyer, and to that end in 1854 made his appearance in the office of Rankin & Miller, in Keokuk, dressed in a suit of homespun. He was accepted and installed as a student and clerk, but his appearance was so much against him as to excite ridicule and sarcasm among strangers who saw him in the office. One of his employers, Samuel F. Miller, now Judge of the United States Supreme Court, saw through the homespun, and found the material of an able man beneath. Being asked what he expected to make of that "gentleman," alluding to McCrary, he replied: "A first-class lawyer."

A year after his entrance into the law-office, he was admitted to practice, having then only reached his twentieth year, and was successful from the beginning of his career. Taking an active part in politics, in 1857 he was elected by the Republicans to represent Lee County in the State Legislature, and was the youngest member in the House. He discharged his duties with marked ability, and in 1861 was elected to the State Senate. Here he served until the close of the war, holding the position of Chairman of the Committee on Military Affairs during his first term, and that of Chairman of the Judiciary Committee during his second.

Upon the appointment, in 1863, of Judge Miller, his old principal, to the Supreme Court, Mr. McCrary was selected by him as his successor in business, and from that time until 1868 he devoted himself to the practice of his profession. He was then nominated for Congress by the Republicans, and was elected by a majority of 5,013. In 1870 he was nominated by acclamation, and in the succeeding election was successful by a majority of 3,366. His renomination in 1872 was again made by acclamation, and he was a third time elected. In the campaign of 1874, when he was a fourth time elected to Congress, he received 11,384 votes, against 9,521 for the anti-monopoly candidate. He was not a candidate for re-election last fall.

His record in Congress is one of which any man might be proud. He has steadily opposed land grants, fought sturdily all monopolies, insisted from the first upon retrenchment and economy, voted to abolish the franking privilege, and has been one of the most prominent advocates of a thorough and radical reform in the civil service. When he was first elected to Congress he served on the Naval Committee, the Committee on Revision of the Laws, and the Committee on Elections. The latter committee had charge of the famous contest between Brewer and Adams, of Kentucky, and in its disposition, Mr. McCrary made a minority report which so favorably impressed the House, that all precedents were thrown aside, and the minority report adopted, and, what may be deemed a very strange thing in these days of sharp partisanship, the Republican House unseated a Republican and put a Democrat in his place. The familiarity he had shown with election laws, won for him the appointment, at the beginning of his second term, of Chairman of the Committee on Elections—a compliment unheard of before for so young a member. In the Forty-third Congress he was Chairman of the Committee on Railways and Canals, and in the last Congress he was a member of the Judiciary Committee. Mr. McCrary took a prominent part in the formation of the Electoral tribunal. In Congress he won not only a reputation for tireless industry, wisdom, honesty, and faithfulness, but has shown by his life that it is possible for a man to be a politician, and at the same time to retain his integrity, so that after ten years of public service, no taint of any shape can be alleged as affecting his reputation.

In many respects this gentleman's career is a remarkable one, and may be cited as a suitable example for the consideration of American youth. His rapid advancement has been won by diligent study, personal effort, and positive merit. Circumstances, it must be admitted, have been much in his favor, but his energy and integrity have been the principal coadjutors.

Mr. McCrary is of medium height, rather full, but not excessive habit; his movement is deliberate, yet decided, showing the man who knows what he has to do. It is said that he was out of place in the House of Representatives, because its members generally act from instinct, or for self or party interest. If this be true of the men who are sent to Congress, there is great need of legislators of Mr. McCrary's stamp—of men possessed of true public spirit, and too honest to suffer themselves to be used as the vehicle of a purpose.

JUDGES OF CHARACTER.—Nowhere, perhaps, does popular belief exhibit its vulgarity and inadequacy more conspicuously than in the readiness of most persons to pronounce an opinion respecting the characters and motives of others. The confidence with which many a man and woman will talk about the desires and habits of a comparatively new acquaintance must strike a reflective mind as a signal illustration of the eagerness of mankind to seem wise. There are many whose modesty and good sense would prevent their giving an opinion on any point of scientific knowledge or æsthetic appreciation, who nevertheless feel no hesitation in passing judgment respecting matters of conduct of which their knowledge is infinitesimal. Numbers of people who do not in the least seem to be ashamed of ignorance respecting most matters of discussion, are quite sensitive as to their reputation for knowledge with respect to the intricacies of human character. When, for example, there is an addition to the society of a small town through the arrival of a new family, there is the greatest impatience to have a definite and fixed opinion respecting the idiosyncrasies of the new-comers. There will certainly be more than one knowing person whose supposed quickness of perception will at once enable them, satisfactorily to themselves, to define and characterize the man or woman about whom curiosity is naturally aroused. It is curious, too, to notice the readiness of others to accord to these persons the special faculty for intuition which they claim for themselves. It has often been remarked that the first condition winning the confidence of others is

to display a fair amount of self-confidence, and this truth is fully illustrated in the case of the people whom we are now considering. When a lady gives out among her acquaintance that she is an expert in matters of character and disposition, she speedily gains an enviable reputation for this kind of prescience. If there is any new character to be deciphered, about which there hangs a certain mystery, she is the authority to whom all repair in order to acquire definite information. If a scandal is just germinating, and everybody is on tiptoe respecting its real nature and results, it is this connoisseur who is resorted to for a final solution of the problem. In this way people are sustained in the pleasing belief that they possess some easy avenue to the minds and hearts of their fellows, thanks to which they are enabled to dispense with the tardy methods of observation, comparison, and analysis, and to read a new character as confidently as an unfolded letter.

"FOWLERISM."

WE find in the *Lutheran Observer* for August 24th, an editorial article under the courteous title of "Fowlerism." It commences: "It is not more than thirty years since Mr. Fowler, of New York, imported from Europe the theory of Phrenology. In this country it found congenial soil, and grew rapidly."

This statement contains two errors and one fact. It is *forty-three* years since the Fowlers commenced to lecture on this subject, and they *did not* import it from Europe. The immortal Spurzheim came here in 1832, and delivered lectures to audiences of the learned in theology, in literature and science, in Boston; and would have lectured in all the large places to the best thinkers of the nation had he not died, from the effects of change of climate and overwork, on the 10th of November of that year, having been in the country but about three months. Prior to that time, however, the works of Gall, Spurzheim, and Combe had been extensively read in this country, and the eminent Dr. Charles Caldwell, of Transylvania University, Ky., had lectured and written much upon the subject. So much for the two errors. In regard to the one fact, we are happy to affirm that Phrenology "in this country found *congenial soil* and *grew rapidly*." The article goes on:

"A cluster of affiliated studies have gathered around this simple original, until it has become a compacted, consistent system of mental and moral science. It is surprising how it has permeated the thinking classes on questions of reform. It meets us and confronts us in every agitation on any question of public morals. Two of its features have become so prominent as to force themselves on our attention. It maintains that crime is not the fruit of responsibility in character, but organic. The cranial developments of the criminal were unfortunate. He inherited an impulse that could no more change than you can turn the winds of heaven or the tides of the sea. He brought into the world an organism that determines his career with all the certainty of fatalism. Hence the pity that public sentiment bestows on bad men."

It has always been amusing to us to hear the objection of fatalism raised against Phrenology, especially by those who hold to the doctrine of Calvinism, which maintains in so many words that "God from all eternity foreordained whatsoever cometh to pass." We suppose our Lutheran brother may not be charged with the highest type of Calvinism; but if he were a strict Calvinist he would incline to make and insist on the same objection.

Now there is, in nature, a certain phase of fatalism which everybody recognizes, so far as individuals are concerned. Abraham Lincoln, for example, was six feet four inches high, and he was not consulted in regard to how tall he should be, and he could not help it. President Van Buren was five feet six inches. He was naturally a man of smoothness and policy. General Jackson was offensively frank. "Who maketh us to dif-

fer?" One man tends to fatness, another is lean and thin; one is calm, cool, collected, and self-poised; another is nervous, sensitive, and irritable. There were differences in the twelve chosen apostles as marked as can well be found in any Church, or other congregation; and we suppose that no doctor of divinity would attempt for a moment to maintain that the gentle John and the impulsive Peter were not constitutionally different, and, if you please, intended to be different. There is, then, an heredity which obtains in every community; in fact, in the same family, and this is a kind of fatalism. There is more truth than poetry in that old homely statement of Scripture, which says: "The fathers have eaten a sour grape, and the children's teeth are set on edge."—*Jeremiah* xxxi. 29.

If the history of this country be traced, it will be found that we have had a wave of war once in about twenty-five years, seeming to indicate that the children born during a season of war inherited a tendency to be quarrelsome or defensive, or patriotic, or whatever name it may be called. We may go back to 1750, about the time of the French and Indian wars, and jump along to the Revolution, and to the war of 1812, and the Mexican war in 1847, and the great struggle of 1861–65, and it will be easy to see how boys born during one time of war would be ready to enlist when the next war came on; and the boys or young men of one war time would be fifty years old and the legislators of the next. And these birth influences, in a sense, are a fatality which may be guided, but can not be abrogated. We are taught by Phrenology, however, that inheriting a tendency from the circumstances of one's birth does not compel, in a thinking, responsible, reasoning being, absolute obedience to the impulse of the force elements. We can array a dozen high faculties against one low one, and thus hold it in check. We often halt between two opinions; we often hesitate when tempted, and royally rise above the temptation. Here is where a man's freedom of will comes in.

Phrenology teaches, and we wish all our religious editors would get hold of the idea and use it, namely, that the different faculties may be recognized in childhood before they have come to such strength of development as to defy modification. Phrenology teaches that if a boy unfortunately inherits more Combativeness and Destructiveness than is comfortable for his acquaintances and friends, and if the mother can understand that fact while he is yet in her arms, she may modify her treatment of him, and thus modify his development, bringing other faculties into activity, and thus cultivating their strength, and also avoid such treatment of him as would annoy and excite his rebellious faculties. Does our good brother's theology and mental philosophy recognize a doctrine of this sort? If not, we can help him by our mental philosophy, and he ought to have helped himself by it long ago. It has been the misfortune of the world that it has had no sound mental philosophy outside of the Bible until Phrenology was introduced. It had not been known, until taught by Phrenology, that the faculties which will show themselves in manhood, can be detected in childhood by the developments of the brain, giving mothers and teachers ample opportunity to train against the inherited disposition, if necessary.

The popular method is to wait until the dog bites before his muzzle is put on. If we can not know beforehand what a child is inclined to do or to be, we can not so wisely or so well train against it. When a farmer sees a weed springing up by the side of a blade of corn, he removes it at once. It looks weak, and a stranger would suppose that the corn would be able to hold its own; but let that weed grow for a month, and its extirpation may uproot the tender plant of the desirable crop. Phrenology shows what weeds are likely to choke the true plants, and how to modify and lessen the vigor of those which are inherited too strongly.

Many a good boy, if permitted to run wild in the streets, will there get culture which will develop the base of his brain, and he will become turbulent and wicked, quarrelsome and unmanageable; whereas, if he have training such as every child has a right to claim, his great natural energy may be kept under proper restraint, and his higher faculties become properly developed. Solo-

mon's proverb deserves a greater prominence than is usually accorded it: "Train up a child in the way he should go, and when he is old he will not depart from it."

People who try to oppose Phrenology talk as if there was no such thing as inherited peculiarities, and no such desirable result as that which comes from training; but they think they must wait for Divine grace to work a miracle upon the miserable sinner before he can be decent. Permit us modestly to suggest, that the proper way to secure the Divine aid is to train up a child in the way he should go; obey the command of the Lord in teaching children what is right and proper, and regulating their conduct; then may we confidently hope for that Divine grace which will finish the structure. Millions of the human race are bred in squalor and ignorance, are trained toward vice and not toward virtue, and it requires Divine grace and the stern statutes of criminal law to keep the men out of State's prison; whereas proper training and proper surroundings might have made them worthy citizens, self-regulating, and capable of fair moral and religious manifestations, and thus ready to accept joyfully the Divine grace.

The *Observer* goes on to state: "The other feature of Fowlerism is, that it cruelly shuts against a bad man every door of hope. His inherited tendencies have hardened into a growth that no power can change."

This matter is perhaps already sufficiently answered. While there is a law of hereditary endowment there is also a law of training and culture, and the advantage which Phrenology has over other systems of mental philosophy is, that you can tell beforehand what characteristics a boy will naturally incline to. If he has mechanical talent, he shows an indication of it in his development. If he lack that power, no time need be wasted in the fruitless attempt to make him an excellent workman.

The *Observer* goes on to say: "An inherited appetite is no relief from responsibility. The guilt of the murderer is not reduced because his father committed the same crime; the drunkard is blameworthy, though his ancestors for a hundred generations were victims to the vice; a transmitted appetite is no excuse for its wanton indulgence, and does not in the least change the color of the act. The thirst for strong drink may be raging, but that should make us the more careful."

We infer from this that our good brother believes a person can inherit genius, idiocy, or a tendency to insanity, and doubt not that his paper within the past three years has given information to the public that some person had descended from a family in which insanity cropped out frequently. The man's father and grandfather, and perhaps an uncle or two, were insane. There is no doubt that persons do inherit a love for liquor, and it is a very strange idea to put forth that it makes no difference with a man's responsibility, though his ancestors for a hundred generations were victims to the vice. We ask our friend if a hundred generations of people have been addicted to a given line of conduct, will it not stamp the progeny with a tendency in that direction? Suppose a man's ancestors for a hundred generations had been holy men, preachers of the Gospel, would it not astonish the editor of the *Observer* if the son should turn out a scalawag? Would he not hold up his hands in grief and wonder, and say that he had disappointed the just expectations of the world? We do *not* claim that a man is guiltless if he commit murder, though he may have descended from murderers; or that men whose ancestors for a hundred generations may have been victims of alcoholism can not and ought not to refrain. Doubtless the posterity of such a person, if rightly influenced, might be able to rise above the temptation, and in a few generations the wrong tendency might be trained and cultivated away. The question of how much a person inherits, and how much of responsibility he may have because of certain inheritances, is a puzzle to the world. We have never yet met with a religious person that stood aloof from Phrenology because, as he thought, it seemed to sustain the idea that if a man has organization he must therefore have character or conduct, who would not take *one side of it* and rejoice in it. If a man were benevolent and generous and liberal and just, men will

rub their hands and thank God that his ancestors for generations back have feared God and worked righteousness, and why should not this son? If a man show eminent talent in learning, in art, in mechanism, in any skill of excellence, such men say, "Of course! his father and grandfather before him have been eminent in these directions, and why should not the son be?" If a person show the spirit of honor and truth, if he is beautiful and manly and noble in his appearance, these men say, "Of course! he comes from such stock. All his people before him have been skillful or honorable or courageous or beautiful. Why should not he be?" This is all very well when the things that are inherited tend to goodness. But suppose the boy inherits squint eyes, awkward teeth, a snub nose, bandy legs, a hunch back, a club foot, or a disagreeable temper, or a spirit of meanness. When there is no theological point at issue, even *these* people say, "What could you expect better? Look at the stock he came from." The phrenological theory is this, that *organization* is the foundation of character; and *culture*, good or bad, *modifies* character. We throw it to the breeze rejoicingly, and are happy to say that Phrenology is the hope of the world. It is the basis of culture; it teaches how to cultivate. There are few well-balanced organizations; there are few thoroughly wise men or harmonious characters. There are few who are so good and so well balanced that we can not detect in them unfortunate tendencies, "easily besetting sins." And since, according to Phrenology, these strong or weak traits of character are indicated by development even before the child is five years old, it enables teachers and preachers and parents to endeavor to lead them, *not into* temptation, but *deliver them* from evil; to train them in the ways of righteousness; to discourage and disgust them with that which is evil, and thus mold their characters.

We often hear men say that a horse that has a fiery disposition was spoiled by the man who broke him. He was nettled and worried and fretted, and his disposition was injured beyond recovery. And we may say the same about boys and girls; evil communications have corrupted good manners; and those that go into the society of the wicked, shall they not become contaminated?

The next article following the one we are reviewing is a singular commentary on the editor's opinions about "Fowlerism." The article is entitled, "Sinless Perfection." The editor says: "Spurgeon may have a homely way of saying a thing, but he has a hearty, forcible way. Over the signature of 'John Ploughman,' in an English paper, he gives his views on the doctrine of sinless perfection:

"'He who boasts of being perfect, is perfect in folly. You can not get white flour out of a coal sack, nor perfection out of human nature. He who looks for it had better look for sugar in the sea. Every rose has prickles, and every day its night. Even the sun shows spots, and the skies are darkened with clouds. Nobody is so wise but he has folly enough to stock a stall at Vanity Fair. Where I could not see the fool's cap, I have, nevertheless, heard the bells jingle.'"

The *Observer*, in the article we have been reviewing, says "there is a power in the world to strike off every chain of vice. Divine love may come down right across a wicked life, and make one part old and the other part new;" thus attempting to show that no matter how wicked and bad a man is, he can be made as perfect as the Divine grace can make a man; and then the article quoted with approval from Spurgeon undertakes to show that man can not be very good any way, even under Divine grace. "We can not get white flour out of a coal sack, nor perfection out of human nature."

"Oh, consistency, thou art a jewel!"

We do not wish to be misunderstood in reference to hereditary development, nor in regard to the law and doctrine of culture as affecting human development and human character. In the first place, no man, no animal, has anything which he has not inherited. I have thumb-nails because my ancestors have had them; I have something of courage, something of justice and benevolence, something of ingenuity, something of affection and intellect, because those of whose stock I am born had them before me;

and I am a white man because my ancestors have been white men. If they had been black, with wooly hair, would I not have had the same? When a man has six fingers or six toes, when an unfortunate child has a great red spot on the side of its face, people ask what was the cause of it. Every man of sense believes that everything that belongs to us had an origin, a cause, a procuring reason. If a child is born having a peevish disposition, a pale countenance, an anxious, sad look, do we not hear the most religious of people, as well as everybody else, say he must have been born of sickly parents, or his parents must have been suffering under sad and sorrowful and depressing circumstances, and these conditions have been impressed into the poor child's constitution. But when we see a child sunny and happy, mirthful and frolicsome, rejoicing in the mere fact of living, is it not a natural inference in the mind of everybody that he must have been born into a family of happy people, who were not molested and pestered, fretted and worried, anxious and gloomy? If in any family of robust and healthy people there seems to be a puny child, people wonder why he did not inherit a better constitution. When a child having light hair and blue eyes appears in a family, all the rest of whom wear the brunette complexion, people look at each other, and are sometimes rude or wicked enough to give to each other incredulous smiles; and not a few poor mothers have been rendered extremely unhappy because public sentiment threw a shadow of suspicion over them. We remember a case of a sunny blonde in a family distinguished for dark hair, sallow complexion, and black eyes; but when we became acquainted with the father's father, we found the granddaughter was a perfect type of the old gentleman in looks, expression, and motion.

It is a source of gratification and thankfulness that the cultivation of one generation may be inherited by the next as natural or constitutional developments; and if this superior development be cultivated in a high degree, the next generation will have still more; and thus civilization with its schools and churches, its literature and science, develops men from low-browed, broad-headed savages, to those thinkers with broad, high foreheads, and to those narrow and high-headed philanthropists that to-day grace and bless the world. Would to God there were more of them!

Everybody who seeks the information knows that animals are bred from low stocks to better by selecting the finest specimens for breeders. Horses, cattle, sheep, swine, are developed. Let a man look at the beautiful Chinese pig, with its small limbs and little feet, with its short, small nose, and compare it with the picture of the old wild hog, with great legs and a long, bony back and bony head, and a snout a foot and a half long; let men look at the fine English race-horse, or the sturdy, stalwart work-horses of that country; let him look at the Durham and Devonshire and other fine breeds of cattle, and deny the doctrine of hereditary descent, and the grand doctrine that character and quality come from organism and culture. The great law is this, that cultivating a faculty develops it, gives its organ strength and largeness; and the lack of culture gives weakness of muscle or brain. If men are wanted to row in a college regatta they are trained. Those are selected who are most muscular to start with, who have the best organization for strength, activity, and endurance; then they are cultivated and trained. Pugilists do the same, and they learn that culture gives development and quality and character.

Let us cultivate men toward religion and goodness, and not stand off and harp against the science that tells the world how to do it; and the progress of the race in goodness, godliness, and happiness shall be the result.

THE children have of late had some familiar talks on Phrenology given them during their meeting hour, which has set their little heads to observing and speculating. The grandpa of one of the five-year-olds, just now here on a visit, and who knew nothing of the above talks, was consequently somewhat taken aback when his little grandson, after a grave scrutiny of some minutes, deliberately asked, "Grandpa, what *temperament* are you?"—*Oneida Circular.*

BRIGHAM YOUNG, THE MORMON LEADER.

BRIGHAM YOUNG was born in Vermont, at Whittingham, on the 1st of June, 1801. His father was a farmer, and he was the ninth of eleven children. In early life he assisted on the farm, both at the place of his birth and at Sherburne, Chenango County, New York, whither his parents had removed. There he received the little education which was his in boyhood. He learned the trades of painting and glazing, and worked at them until he was past thirty years of age. As a boy and young man he exhibited no remarkable capabilities and attracted no consideration; his temperament being of a slow character, inducive of late maturity and rather deliberate action of faculties. In 1833 the crisis in his life occurred. Joseph Smith was then preaching in the neighborhood of Sherburne on the doctrines of the book of Mormon, that remarkable "revelation" being then quite fresh, as it had been "dug up" but two years before. Brigham was very much impressed by these new ideas, and he repaired to Kirtland, Ohio, the first Mormon rendezvous, where he plighted his faith and received the appointment of elder. He proved in the start an excellent proselyte, and set about converting others with great zeal. Experience added greatly to his confidence in himself, and his influence rapidly increased. A year or two later he was ordained one of the "twelve apostles" of the "Church of the Latter-Day Saints of Jesus Christ."

In 1836 he became the president of the "twelve apostles." From Kirtland the Mormon company was removed to Independence, Jackson County, Missouri, and shortly afterward to the town of Nauvoo, in Western Illinois. It will be remembered that in Missouri the "saints" suffered from religious persecution, the Governor threatening to exterminate them if they did not leave. At Nauvoo, however, they were received kindly, and there they became established. In 1840 Brigham went to England as a missionary in behalf of his community. Immediately on his arrival he commenced to preach, and established a newspaper called *The Millennial Star*, which is still published. His ministry was remarkably successful, for within one year he returned to America with nearly eight hundred converts. A few years later trouble arose in Nauvoo, on account of the introduction of their polygamic system and the interference of the town authorities to prevent it. Joseph Smith and his brother Samuel were arrested and put into jail, and subsequently killed by an excited mob. Young was in Boston at the time, but he hurried to Nauvoo, gathered about him all the Mormons he could find, and proclaimed himself president, that office having been assumed by one of the Mormon counsellors, Sidney Rigdon, but without authority, as alleged. The Mormons became more and more unpopular in Nauvoo, so that it was decided to seek another place of residence, where they could be master of the situation. Brigham assumed charge of their migration, and led them westward across the Mississippi without a definite point in view. It was in the winter, too, and the people being without sufficient food or protection, hundreds perished by the way. In the autumn of 1847 they reached and crossed the Missouri River, and built log huts near what is now the city of Omaha. Meanwhile the Mexican war had broken out, and five hundred or more of their best blood were enlisted by the Government as volunteers in the struggle. They enlisted, it is said, by the advice and urgency of Young, receiving for their services twenty thousand dollars bounty money, which Young took charge of and kept. He set on foot, next, an exploring expedition, which proceeded as far as Salt Lake, where a stand was made, and after some deliberation that region was selected as the future home of Mormonism. To that place were transported all the faithful who had been left behind at different points, and thereafter all the converts who were made in Europe and this country. Brigham Young assumed high powers, styling himself "prophet," "revelator," etc., as well as "president" of the Mormon people. They, in fact, now regarded him as the rightfully-

appointed successor of Joseph Smith, and his sway over them became absolute.

In September, 1850, Congress gave a territorial government to the region, naming it Utah, and President Fillmore appointed Brigham Young Governor of the Territory for four years. This act, we presume, was done in grateful consideration for the services which Brigham had performed in furnishing recruits for the Mexican war. Of course, it added greatly to the influence of the Mormon chief. His preaching was, indeed, with power, and the missionaries which were sent abroad met with extraordinary success. Soon the official census showed that there were more than eleven thousand persons in the Territory, and the practice of polygamy contributed greatly to the increase of population. There were Mormon representatives at Washington who were successful in obtaining favors of one kind or another from Congress; one of which was the distribution of the territorial lands, most of which were appropriated by the leaders of the Church. An effort had been made previously to secure the admission of the Mormon community as a State, with the name Deseret. The question was considered in Congress, some modifications of Brigham's schemes made, and the grant of a territorial government issued. The political system of the Mormons at this time was what it has substantially remained ever since: universal suffrage in the fashion of imperial France, every man having a vote, but being supposed to vote by the direction of the counsel of the Lord through His prophet, Brigham Young. After a few years the general Government found it necessary to interfere in the affairs of Utah. Colonel Steptoe, of the United States army, had been appointed Governor at the close of Young's term of office, but the latter shrewdly contrived to obtain the Colonel's sanction to his own re-appointment, Steptoe resigning in that behalf. The administration deemed it necessary to quarter some troops in Utah for the purpose of maintaining a proper

recognition of Government authority. Of course, the Mormons were restive under such restraint, and trouble arose. The Mormon war of 1857 was the result. President Buchanan dispatched three thousand troops to Utah for the purpose of carrying into effect the orders of Government, and the Mormon chief promptly issued a proclamation which was substantially a declaration of war, or of resistance to the United States, which placed the Territory of Utah under martial law, constraining every man of the faithful who could bear arms to withdraw from his usual vocation and train as a soldier. During the winter negotiations were set on foot which resulted in Governor Cummings being received by Brigham and taking in charge the territorial records and papers. Brigham, of course, was greatly dissatisfied with this result, and he promulgated an order which he asserted was inspired by Divine authority, commanding the people to leave their homes and migrate to the South. In this, as in all other things, he was obeyed, the people actually getting ready and starting with their household goods and provisions. A halt was made at Provo, fifty miles from Salt Lake City. This movement was made early in the spring, and the company suffered much from inclement weather and cold. A few days after this halt President Buchanan sent a proclamation of pardon to the Mormons, and they returned to Salt Lake City on the 7th of June. The Mormon leaders now agreed to receive the officers of Government, and not to resist them in the execution of duty, but to obey the laws of the United States. This was the end of the so-called Mormon war, no sanguinary encounter having taken place.

It was in 1857 that the famous Mountain Meadow massacre occurred. Our readers, doubtless, are familiar with the circumstances of this terrible outrage, as they were recently set before the public in the testimony given on the trial of John D. Lee, a prominent Mormon elder, for participation in the affair, and who was found guilty and executed last April. Brigham Young's connection with that massacre has never been judicially established, although the opinion prevails that the unfortunate emigrants were murdered by his sufferance. In 1862 Mr. Stephen S. Harding was appointed Governor of Utah by President Lincoln, and one of his first acts on assuming the functions of office gave great offense to the Mormon chief. He had no sympathy with the practice of polygamy, and found nothing in Utah to modify his opinion of it as formerly entertained. Therefore, in his first message to the Territorial Legislature he denounced it, and called special attention to the fact that by it a recent act of Congress was directly set at naught. This message was suppressed by the Utah Legislature at the instance of Young, but was subsequently published by order of the United States Senate. Since that time civil affairs in Utah have been characterized by more or less trouble in their legislative and judicial administration, the officers of Government endeavoring on the one hand to execute the ordinances of Government, and the Mormon leaders on the other hand interfering with, embarrassing, and nullifying their efforts in various ways, shrewdly avoiding any disastrous results whenever their opposition had brought matters to a crisis.

During the past ten years Young had chiefly occupied himself in carrying into effect certain favorite notions with regard to his people rendering themselves self-sustaining and entirely independent of the rest of the world. With remarkable energy he set on foot all sorts of manufacturing and agricultural enterprises. One of his great aims was to prevent the "saints" from having commercial relations with outsiders. In the outset of the construction of the Pacific Railroad Brigham Young exhibited much hostility to it; but finding that fruitless, he afterward supported it, and went so far as to pay for the construction of the Uintah branch between Ogden and Salt Lake City.

In the many judicial prosecutions instituted against polygamy he, of course, occupied a chief place. His attention for several years prior to his death was largely occupied by them. His social relations were interesting, for the reason that he had fifteen wives of his own, and a large number

of others "sealed" to him. Prior to his embracing the Mormon faith he had been married, but was left a widower with two children. His father and family became connected with the Mormons as converts. His first wife in the polygamic relation was Mary Ann Angell. Ann Eliza Webb, who has become notorious on account of her application for divorce in alimony, was his nineteenth wife. The favorite wife of his old age was Amelia Fulsom, a native of Portsmouth, New Hampshire. During the latter part of his life she occupied an elevated position among the "saints." It is said, not to his credit, certainly, that the majority of his wives were never visited by him in his late years, but left to support themselves and their children as best they might in a life of drudgery and poverty.

Brigham Young was a man of robust and powerful physique. He was something over six feet high, with a great development of the chest and body, which gave him the appearance of being much shorter than he was. His head was broad, and largely developed in the basilar and posterior regions, somewhat narrow in the upper region of the forehead, and strongly projecting in the perceptives. His appearance was agreeable and impressive. He possessed an immense deal of that sort of attraction which is termed magnetism. The portrait accompanying represents him as he appeared about eight years ago, and certainly confirms these statements. Although lacking in education and in the first elements of oratory, he was fluent in speech and able to hold his listeners to his theme and obtain their consent. He possessed the faculties which give one good judgment of men, and he exercised them to advantage. This is one of the secrets of his remarkable influence over his people. His Self-esteem was enormous, and that, associated with his excellent business capabilities, gave him the success which was his in so extraordinary a degree. His Acquisitiveness was large, and the prosperity of Utah contributed to his own possessions, so that he became very rich. His estate is estimated at over two millions of dollars, and by his will is to be distributed among his kindred. This kindred he specializes as seventeen wives and their children. He was the father of fifty-six children, of whom forty-four are living. His personal habits were simple, and simplicity characterized the arrangements for his burial. He had given minute directions in this respect, and our Christian communities may find something of profit in their consideration. His body was inclosed in a plain red-wood coffin, and borne to the grave by his former employés and a vast concourse of people. Remarks were offered by Mormons of eminence, most of whom had been associated with Brigham Young in the conduct of the affairs of the Church from the beginning.

The question of the successor of Brigham in the Presidency has not yet been decided, but in pursuance with a "revelation" obtained soon after the great leader's death, John Taylor, now the oldest or most prominent apostle of the Church, has assumed the place until the true man shall appear.

FJÄLLTRASTEN.

FROM THE SWEDISH OF BISHOP TÉGNER.

On a lonely grave near Belten
Sat a Northern thrush one time,
Over wood and over mountain
Rang afar his wildest chime.

Wide across the blue lake rocking
Came a swan from Southern sea,
Splendid in the sunlight flashing,
Snowy wings were waving free.

What a wondrous tone and color,
Never voice so pure and clear,
As in Southern zone and summer,
From Apollo's bird you hear.

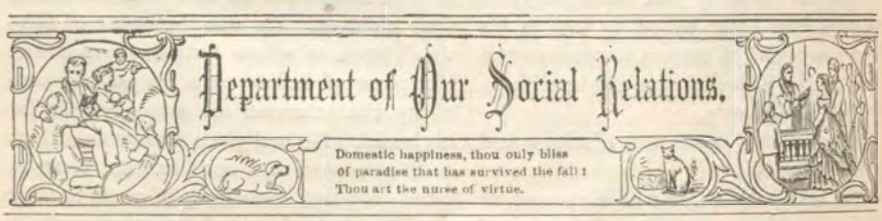
"Oh, poor Thrush!" she said, "how sadly
Every rule of art you break!
How long will you trill so badly,
Through the firs such discord make?

"Without taste, pray what is genius?
Strength, without its beauty fair?
Learn to sing, like me, harmonious,
After notes, with rule and care."

"But the muses' gifts are various,"
Said the Thrush, a little grieved.
"Southern tones may be melodious,
Mine were from the North received.

"Other stars with us are flaming,
Other feelings and desires;
How can song be one unchanging,
When so varied theme inspires?

"Art is but the world's great mirror;
Time, a people's epic ode.
Can, then, taste have other measure
Than by genius first bestowed?



"Be forbearing, beauteous sister!
Every one must have his part;
Wild my song to you and dyster,
But is yours without a fault?

"Let us love all forms of beauty,
Let the Northern have its charm,
While we learn to value truly
Southern tones so soft and warm.

"Measure not wide gift of Heaven
By your narrow scale alone,
Many forms to art are given,
Though her noble soul is one."

Saying this, on daring pinion
High he soars to Oden's hall,
Till his song's sweet, wild dominion
Rules o'er mountain vale and all.

LYDIA M. MILLARD.

WHAT IS OUR DUTY?

THIS question is constantly being asked by scores of women who believe in justice, and who want to love and help their fellow creatures; by those who consider it their highest privilege to be of real service in the world. It would seem the correct thing to care in such helpful ways for those who are nearest at hand, in many cases those whom circumstance has brought under the same roof. Now, is this not in many instances a colossal and often impossible task, especially when kind actions can not be dissociated from intimate relations? One can help one's washerwoman or seamstress with most effectual results; because this assistance does not in any way compromise future intercourse. With your friend it is different. This friend, whom you like, respect, and with whose trials and successes you keenly sympathize, demands, on account of this friendly expression of regard, a certain portion of your time and thought. She is worthy in every respect, and yet the intimacy which she considers her privilege—if not her right—you find yourself strangely averse to. Wherefore? What does it mean? and now you begin to analyze, and pick yourself and your friend to pieces.

She has a sweet disposition—sweeter than yours, you may be obliged to admit. She is intelligent, cultured, original may be, cleanly in her habits, and altogether an attractive person. You admit her superiority, and stand appalled at your own feelings. She is welcome in your parlor, but the privacy she covets with you, you abhor.

Probably the most tantalizing feature in such cases is your own inability to pick flaws in the individual. Her affection for you increases, but in proportion as she steps forward in this respect, do you retreat. Her kiss on your cheek burns all day, and her arm about your waist makes you wish you had never been born. You call yourself hard names, and believe in total depravity. Just as likely as not she overloads you with favors which you are restrained from refusing on account of her sensitiveness. She is all kindness and goodness; and how can you wound her? To stand up in cold blood, and tell her the true state of the case, would be a harder task than to rob a hen-roost, or pick a man's pocket; and then there are certain things about her you enjoy. Once in a while, with the width of a room between you, you are comfortable and happy. In

close proximity, and after an interview of an hour or two, you find yourself weak and exhausted, and as likely as not ready to cry.

Now, must this not be a purely physical and magnetic repugnance, over which mind has no control? Does it not come under the head of elective affinities, and is there not an honest and straightforward way of managing these inharmonious relations? But, on the other hand, is there a woman large enough, enlightened enough to bear such a statement of facts in the true spirit? It isn't of the slightest use to enumerate the angelic qualities of your friend. You are aware of them all; and while you may feel yourself a miserable sinner by contrast, it doesn't help you to bear her any nearer. You realize that all the will in the world can not dominate this strange, elusive something—this something which perpetually dodges you, but which holds you in a grip of death. It is like spun steel, and stronger than your virtue.

A little incident which happened to the writer, will, perhaps, illustrate the apparent unreasonableness of these influences. An accident on a pleasure trip, threw our party upon the hospitality of some strangers also traveling. One of these, a lady, was very helpful in assisting me to a change of garments, and in the most unobtrusive manner possible, strove to be of service. I was considerably shaken by the accident; but something in her sweet voice and manner soothed me in spite of myself. I went to sleep with my hand in hers, and awoke in the same position, wonderfully refreshed, and ready to resume travel. Our little sojourn together could not have lasted more than four hours, and yet to me—and I believe to her—it gave a pleasure, the remembrance of which will last to all eternity. After good-byes, and mutual good wishes had been exchanged, and we had started on our journey, then it was I found out that this woman to whom I was so attracted, and who had been mutually attracted to me, was a notorious member of the New York *demi monde*. This incident proves one of two things: my own inherent depravity, or the total absence of mind or judgment in such choice. In other words, these predilections are likely to be the results of nerve selection or affinity. You know that you admire virtue, and strength, and heroism, and strive to possess them; but you also know, mayhap to your eternal disgust, that the sinner is more agreeable than the saint, the coward than the hero. Now how are we to manage these things? Shall we endure our friend's intimacy, because of their desire for these relations, and make ourselves ill and miserable by such self-abnegation, or shall we sacrifice our friend to what the friend will doubtless consider a whim; or do worse than this, perhaps, deliberately resolve to wound her? In this question are involved subjects of the deepest importance, not only to the individual, but to society in general. The great trouble is the universal ignorance in regard to these hidden magnetic laws. What if the University professor or the Public School principal and teacher had some practical knowledge of these things, what a difference there would be in the seating and classifying of scholars. Now, if Susie Brown don't want to sit by Nellie Jones, and protests in the matter, perhaps to the extent of a crying spell, this is proof positive to the teacher that Susie Brown ought to be made to keep that seat. That inner occult something which rasps the child's sensitive nerves to the muddling of her brain, and the breaking down of her health, are too whimsical and ridiculous to be considered. What if the physician understood enough of these overpowering conditions to turn his eyes away from the bed and the patient to the social surroundings of the invalid? Oftentimes it is not the friend out of the house who ought to be excluded, but the friend under the same roof, or the nurse at the very bedside These are often the greatest hinderances to recovery, and skillful and well-meaning physicians are constantly being baffled by just such undermining influences. Having been the recipient of many a sick-bed confidence, I know whereof I speak. Let us have more light thrown on these subjects, and let us not be afraid to use it.

LIGHT IN DARK PLACES.

"This mournful truth is everywhere confessed,
Slow rises worth by poverty depressed."—SAMUEL JOHNSON.

CHAPTER VIII.

FURTHER GLIMPSES OF CAMP LIFE.

THEY had not sat down to breakfast yet the next morning, and Sadie was watching the baking of some oatmeal crisps when a rap was heard at their door. Norton opened it, and found Mrs. Moriarty.

"Kin I see the missus?"

"I guess so."

And Norton went to the door of their other room and informed his mother, who soon after repaired to the caller.

"Good-morning, Mrs. Moriarty."

"Och, and its good mornin', indade, to ye, me leddy. It's not inthrudin', I am?"

A kind shake of the head, on the part of Mrs. Camp, and she went in.

"Shure, an' I'm thinkin' I'll jist take Mickey and go on wan of thim ixcurshuns they give to the poor childer."

"It would do him good, Mrs. Moriarty, to have a breath of sea air and a run on the beach with the other children."

"Yis, that's wot I was thinkin', but I thought I'd cum down and ax ye about it afore I'd made up me moind intirely to go. The Dutch woman jist ajinin' me, is goin' wid her *kinter*, as she's afther callin' the two little griggs, so I'll be havin' company. An' I'd be takin' the little darlint over there by the windy (pointing to Dell), if ye'd thrust her."

"Thank you very much for your kind thoughtfulness, Mrs. Moriarty, but Dell goes out almost every day, with either me or Norton. To-day, as it will probably be very pleasant, she will go with me over the river to Brooklyn. I have some work nearly finished which I am to take there."

"Musha, and that smells good. What is it ye're bakin' there, young miss?"

"Only oatmeal," replied Sadie.

"Oatmeal! shure, and that's a purty dish. Faix, oatmeal was what we lived on, wid pertaties, most of the time in the ould country, an' I bile up a bit now and thin for me ould mon and Mickey. But what kind of a cake is that? Shure, I niver see anythin' loike it afore!"

Mrs. Camp broke off a liberal piece of a brown, crisp cake which lay smoking on the table, and handing it to the woman, said:

"This is what we are very fond of. Take a piece and try it."

"Whist now, I know it's good; iverything yer hands do is jist the bist, Mrs. Camp; and ye take so little throuble to do it too."

"The simplest methods produce the best results, Mrs. Moriarty. People spoil a vast amount of good food material by trying difficult and roundabout ways in preparing it for the table. They somehow can not understand that very little manipulation or change is necessary to render palatable what is fit to be put into the stomach. Indeed, many people actually spoil nearly everything they touch by the way they mix and turn, salt, dress, and cook, and they scarcely know the natural taste of the meats and vegetables they have upon their tables day after day."

"Faix, an' ye'er right, missus. There's me sisther, Rosy-Ann, who's lived out more'n fiftane years in Ameriky come nixt October, an' she sez that divil a wan of all the families she's cooked for cook loike any other. Botheration to't, she has to learn a new way ivery toime she changes places, an' that, lucky for her, hasn't been often of late. But she's been that mad sometimes with the toastin', and roastin', and stewin', and mixin' that's put on her, an' she knowin' that 'twas bint they were on sp'ilin' the good things they had to cook, that she's given the misthress warnin', and lift the nixt day. Shure, an' wasn't Rosy-Ann in a hotil wanst, an' didn't she learn there from the chafe-cook, a rale Frinchman from France, how to make the most beauchiful soup and stew, and with nixt to nothin' for matarial? But I'm kapin' yees from yer breakfast, and me

ould man and the b'yes are starvin' for theirs. Good-mornin', ma'am, and the darlints."

Mrs. Moriarty then bowed herself out, and mother and children sat down to a breakfast which an epicure used to the dining-hall of the "Brunswick" would have pronounced "thin," but which to the simple, unperverted palates of the Camps, appeared delicious. There was the crisp oatmeal cake warm and brown from the oven, with its accompaniment of fruit sauce, this time Turkish prunes, simply stewed; there was a poached egg for each, whose plump, golden center in a circle of white, gave it the appearance of an exaggerated field daisy; and there was a plate of wheat biscuits, round, brown, and so sweetly aromatic, by reason of their freedom from all chemical ferments. Butter was a luxury that Mrs. Camp's narrow purse could not afford, but they felt no need of it, for a little milk which Norton bought at the "creamery," or the fruit, made a toothsome dressing, more than filling the place of the oily extract.

"Um, ain't this good, Nortie?" said little Dell, smacking her lips with enthusiasm over a second piece of the thin meal cake which mamma had just spread thickly with the fruit juice.

"I rather guess tis, I could just live on this every time."

"I think you'd get tired of it after a while, and want something different for a change," suggested Sadie.

"Oh, you just try this 'individible,' as Bumpy says. The other day when a muffin-man come along the street, Bumpy looked into his basket and said: 'My eyes, Mister, if this individible had five cents, he'd buy out yer stock.' I up and told him, Sadie, that if he once had a taste of your breakfast-cake, he'd want no more of them greasy, floury things."

Breakfast over, all joined in clearing the little table, and even little Dell, who was but seven, had her share in the work, going briskly about with dustpan and brush to gather up the crumbs. The breakfast dishes washed, and dried, and put away, Sadie sat down for the half hour she had before leaving for the bindery, to read an instructive book which she had procured from the Mission Library. It was a collection of biographical sketches of eminent men and women. She had a habit when reading, if her mother were at hand, of reciting aloud passages which impressed her as particularly interesting. This Mrs. Camp encouraged by giving her attention, and commenting upon the subject of a passage, and of course

Mrs. Moriarty's Morning Call.

such a practice served to strengthen the maiden's memory and reasoning capacity, and to refresh the mind of her mother. In this pleasant employment, her half hour soon slipped by, and Sadie, glancing at the little clock, closed the book with a sigh:

"Oh, mother, if I could only read as much as I would like to, and not have to go to that Blossom & Gaff's!"

"My child, I know it is hard to turn from what is proper and highly desirable, to that which is compulsory and severe. In the springtime of life, to submit to repression, to see what we deem opportunities for personal culture and improvement pass without our being able to use them, is dispiriting. Yet there is some consolation in knowing that our condition might be much worse. And we can also glean a lesson in patience from the experience of the many who have become great and earned honor in spite of adversity in their youth. You know the early history of the late President Lincoln, the few books he had to read in his boyhood, and how he kept a scrap-book to preserve what he thought worthy. A plodding blacksmith, who is yet living, became, by study in the short intervals of rest from his forge, the great linguist of his time."

"I've read of him, mother; you mean Elihu Burritt."

"Yes, and lately the magazines and newspapers have had much to say of an extensively learned Scottish naturalist by the name of Edwards, who was a shoemaker, and so poor that he could at first only pursue his studies late at night. Little by little, my daughter, we can build up a large edifice of knowledge, if we are diligent and regular in using our spare time. Half an hour a day is more than many have had to themselves when young like you, and yet their learning in the course of a year became really vast, and made them famous."

"I think I do pick up a good deal, mother, as I go along. When anybody alludes to anything which I have read about, it seems to come fresh into my memory. Perhaps I remember all the better for reading so little."

"Yes, you thus have time to think about what you have perused, and to digest it well. People who read a great deal, do not give their minds the opportunity to analyze and reflect, consequently their much reading does them harm by clogging the action of the mind, and really weakening it. A few worthy books well read and remembered are more profitable than a whole library skimmed over."

Sadie was now ready for the street, and with warm kisses for mother and little sister, tripped away in a happy humor, the little talk just had giving her new strength to meet the difficulties of her present, and fresh hope for a better condition in the near future.

CHAPTER IX.

MR. STANLEY SHOWS A DEEPER INTEREST.

WE left Mr. Stanley on his way home after his timely intervention in behalf of Betty and Sadie. He was an active member of an up-town church, and having been given the charge of certain charitable work among the poor, had made the upper part of Cherry, Henry, and neighboring streets his field, and while thus engaged, he had become acquainted with the young men whose improper fun he had interrupted; and had exerted no little influence toward reforming them from the habit of tippling, into which, like most young men of their class, they had fallen. The object, it was plain, had not yet been accomplished, but there were indications of progress which were encouraging.

No one who is engaged in Christian labors among the degraded, if he or she be wise, expects immediate and satisfactory results. Much time must be spent, the same admonition repeated many times, and the same kindness performed before any loosening of the old bonds may be perceived. The poor victim of corrupting associations and practices must be first raised to a mental height whence he can view himself, and realize his condition and his need of reform and improvement. Unless this be done, there will be no substantial amendment in his life. Mr. Stanley was an ear-

nest and intelligent missionary, and had accomplished much, because he understood the character of the poor people whom he sought to help, and offered them encouragement and sympathy in their weaknesses and errors instead of reproach and criticism; thus arousing sentiments of industry and self-maintenance in those who were disposed to depend upon others for daily food.

Dashiel Stanley was a bachelor, upward of forty-five years old, and living with a married sister. Why he had not married may appear in the course of our narrative, but generally, in answer to questions on the subject, he replied that he found so much to do in other people's families, that he had no time to have one of his own. Two days after his meeting with Sadie, he was standing in his salesroom when Norton entered.

"Good-morning, my young paper merchant, how is business with you?"

"Good-morning, Mr. Stanley," replied Norton, a little confused by this style of address, commonplace enough among business men.

"I mean," replied the gentleman, "do you find ready sale for your waste?"

"Oh, yes, sir, but the boys say that the price is 'flat,' so I suppose that I don't get as much for it as I might, could the dealers sell it quicker."

"Yes, the paper trade is pretty dull. But how are the people at home? Your good mother, is she well?"

"Yes, sir, thank you, and mother says she is very much obliged for your kind help when our Sadie was set upon the other night."

"Oh, that's not worth mentioning; any man would take the part of a lady when attacked by rowdies. Those fellows intended only a little sport. So they said, but being drunk, their sport might have proved dangerous. When a man is under the influence of liquor, he is easily led into misconduct, from good humor he easily passes to anger, and that with but little pretext, and then is likely to commit some serious act of violence. The drunkard is a very unsafe person. I hope that you will never get into habits of drinking liquor."

"Oh, I never shall," exclaimed Norton. "I see enough drunken men, and women too, every day, to make me afraid of liquor."

"A very wholesome fear, my boy, which should cling to you through life, and if you come out a man like your father—"

"Did you know my father, Mr. Stanley?" cried Norton, impetuously.

"Yes, I knew him well."

"How glad I am," exclaimed the excited boy, seizing the gentleman's hand, who sympathized heartily with his eagerness, "to know some one, a nice, good man, who used to see and talk with my dear father. I was a little boy when he went away from us to the war. We had a real nice home then, sir, in Lowell, Massachusetts. Mother has told us so often about it—and he never came back."

"Yes, my poor boy, he was shot in the battle of Gettysburg. We were in the same company, and ate at the same mess. He was a lieutenant then, and I was orderly sergeant."

"Wouldn't mother like to talk with you about him though! I wish, sir, you would see her sometime, if you don't mind the place where we live."

"I shall be glad to call. When is it convenient for her to receive visitors?"

"I think about seven o'clock or after. Mother's pretty busy all day, but if you'll please say when you would come, I'm sure she'd be ready to see you. Perhaps you may know, sir, that father enlisted at the very beginning of the war, and only came home once for a little while before he was killed, and I just remember how they brought him home in his pretty uniform, and he was buried just the same, with the bright sword in the coffin."

"If I remember rightly," said Mr. Stanley, "your mother came down immediately after the battle, and took charge of the lieutenant's body."

"Yes, she did; and she says the soldiers were very kind to her, although there were so many killed and wounded to be looked after."

"Well, my boy, I shall certainly go to your place within a few days. Let me see, I have the number here, — Prince St., third story, back rooms. And now you can help

yourself to your paper stuff, while I attend to that customer who has just entered. Good-morning."

"Good-morning, and thank you, sir," said Norton, who at once proceeded to collect the odds and ends awaiting him. The conversation just had with Mr. Stanley filled his little head and heart, and he worked with great dispatch, being anxious to finish his morning's round as quickly as possible, and get home to tell his mother all that had been said.

Mrs. Camp's hour for dinner was quarter-past twelve, to suit Sadie's convenience, who came home at noon on fine days. Mrs. Camp deemed the out-of-door exercise she thus obtained, to be beneficial, to say nothing of the change afforded Sadie's mental life by the ten-minute walk from the shop

LITTLE DELL.

to their rooms. Generally, working-girls live so far from their place of employment, that the short hour at noon is insufficient to permit them to go home for dinner; they therefore prepare a meal which they carry to the shop, wrapped in paper or napkin, according to their several notions of neatness. During the noon-spell, while discussing this cold cheer, they are disposed in groups, for the most part talking frivolously, or commenting on their work and prospects in a way which is equally useless. Sadie did not incline to the idle gossip of her work-fellows, so preferred to run home, and the distance being short, she could eat her portion of the meal, and give a few minutes to her book, if the talk of the family did not consume the time she had to spare.

Norton reached home that day before the bells struck twelve. Mrs. Camp was making the table ready.

"Mother," cried the boy, "do you know that Mr. Stanley knew father well? was in the same company with him, and remembers about your coming to the camp after he was shot."

Five years had elapsed since that dreadful blow to her devoted woman's heart, but any allusion to it was sufficient to awaken the feeling of anguish which remained deep in her bosom. Starting at Norton's unexpected announcement, her face paled, but quickly recovering herself, she replied calmly:

"Mr. Stanley has been talking with you to-day about dear Lawrence, then, my son?"

"Yes, mother, and he said that he would come to see you soon, if you had no objection. Didn't you ever know Mr. Stanley, mother?"

"Not personally, but since you have mentioned that he was in the same company with your dear, buried father, I remember that in some of his letters, Lawrence alludes to a Mr. Stanley as being one of his camp associates. I should be glad to meet Mr. Stanley for your sake, Nortie, as well as for the sake of the dear one who died contending for his country in the same ranks."

Mrs. Camp's voice trembled, and Norton knowing the subject to be a painful one, turned to Dell and began an account of his street doings that morning.

CHAPTER X.

NORTON IN TROUBLE.

THE weather had become quite warm with the advancing season, and Mrs. Camp, to promote the movement of the air through her apartments, usually kept the outer door ajar during the early hours of the day. This morning, little Dell was swinging on the door-knob, now and then peering into the hall-way with a child's curiosity, especially if any sound of footsteps or other movement were heard. Mrs. Camp was busy with her sewing, so busy that Dell knew by her expression, that mamma must not be disturbed now by noisy play or prattle, and the lit-

tle girl, as she peered into the long, dim passage and down the long, steep stairway, thought longingly of the green and shady walks of the parks she had been taken to run in occasionally, and of the pretty green country, with singing birds, and cows, and lambs, of which nice stories had been read to her by Nortie from the books he obtained at the Mission Sunday-school. Poor little one, the thought of all that life and beauty out-of-doors somewhere, made her half sad at first, but the next minute quickened the impulse of her heart with a cheery, joyous sentiment, and she talked half aloud to herself thus:

"When I get a big girl, I know what I'll do. I'll go 'way, 'way off out of this great big place, where all the houses are so big and dark, and so close up together. I'll go, yes, I will, 'way off 'mong the trees and flowers, and live in a house with, oh, such a nice pretty garden. And I'll have kitties, and chickies, and birdies, and ever so many lambies. And I'll have a nice, good horssie, and drive him all my own self, and I'll come and take mamma and sister, and give them such a nice ride. Oh, won't that be nice!"

And the little girl in the ecstasy of her delightful picture of the future, fairly shouted and clapped her hands.

"Gently, my darling, gently," admonished Mrs. Camp.

"Oh, I forgot; I was thinking, mamma."

"Of what was my precious thinking?"

"I was thinking about such nice things—of being 'way off somewhere in the country, and having chickies, kitties, and I don't know how many other nice things, and—why, there comes Bumpy!"

While Dell had been talking, she was still in the door-way, and in the midst of telling her happy thoughts, Bumpy indeed came in view, while ascending the stairs two steps at a time.

"Say, young 'un, is the missus 'round here?" asked the young representative of Sullivan Street, half out of breath.

"If you mean mother, yes."

"Then I wants ter see her dereckly."

And Bumpy pushed on into the room where Mrs. Camp sat. His errand was an important one, she immediately perceived, and said by way of salutation:

"Well, my young friend, what have you to tell me?"

Bumpy coughed once or twice, shifted from one foot to the other, took off his cap, and twirled it two or three times, and then as if he had brought his resources of language into play, said:

"I've kum, missus, to tell yer as how Woolley, him as is yer boy, an' me, and sum other fellers was a standin' down in Broome Street, 'fore a shop where they sells soger water, peanuts, oranges, bernanners an' such, an' one of the fellers said he'd jest like ter have some of them oranges, and meant to have one too, and axed me ter go up ter the stan' an' take two or three. I said I wouldn't do it. Then he jest said to Woolly, who was a standin' by me, 'Yer'd better get them oranges, or I'll spile that fine sugar face of yourn.' Woolly then started to walk off, when the other feller, a big un, twice my size, jest took ahold of him an' throw'd him ag'in the stan', knockin' down the hull concern, an' then the fellers jumped in and grabbed wat they could, an' put roun' the corner. Woolly was so mad that he jest jumped up and went into the big un that'd pushed 'm down—'cross-eye Tim 'they calls him—and I swow, missus, he'd jest licked him ter pieces ef the man wat keeps the place hadn't run out an' took 'em both by the collar, and held 'em till a cop kum over and 'rested 'em. Woolly tole the man all 'bout it, but no use. He said he'd let 'em know their biznes, comin' 'round his store and knockin' down his stan' jest ter raise a row and steal his things."

Mrs. Camp, with ready intuition, had foreseen almost on the first appearance of Bumpy, that he was the bearer of disagreeable intelligence, and had braced herself for something even worse than what he had to tell. Naturally sensitive, her feelings were easily aroused to pleasure or pain, and she was also constitutionally averse to scenes and experiences which brought into relief the coarse and vicious qualities of human nature. Necessity, since the death of her husband, had forced her into contact with so many different people, and had compelled

her to receive so much rudeness and even cruelty from persons who employed her, that the lower or physical qualities of her organization had been brought into activity, and gave to her sensitiveness an offset of strength which sometimes surprised her. In this trouble she felt embarrassed, not only because of her maternal solicitude for the boy, but also because she had then in hand certain work which was to be completed and delivered the next evening, and to accomplish the task would require all her time until then. She had procured this work at a new place, and was anxious to be punctual in its delivery, because she would thus probably procure more, and perhaps establish a connection which would last during the summer. This would prove indeed fortunate, as the prospect for workpeople was more lowering than ever, so many shops were suspending operations as the season advanced.

After questioning Bumpy closely, to satisfy herself that Norton had acted only from the impulse given by a sense of wounded pride and honesty in attacking the other boy, and to ascertain the location of the station-house to which Norton had been taken, and the name of the storekeeper who had caused his arrest, she asked him to go the Mission and ask for Mr. Hammond, the Secretary of the Society; and if he were there, to request him to wait until she called.

Bumpy ran to the Mission office, and finding the Secretary, delivered Mrs. Camp's message in his original fashion, and then hurried back to announce that Mr. Hammond would see "the missus right off."

"Now, my good boy," said the lady to Bumpy, "are you busy to-day?"

"Nothin' 'tickler t'do, mum."

"Will you go with me, then?"

"Yes, mum, I jest will. Didn't I jest kum to guv yer all the help I kin to git Woolly out of the jug down there?"

Having placed Dell in the care of Mrs. Moriarty, the lady and her young assistant walked to the Mission.

Mrs. Camp had called on Mr. Hammond not very long before in behalf of a poor woman who had a room in the same house, and who had become, through sickness, entirely destitute. So he recognized her, and courteously invited her to take a chair.

"I beg that you will excuse this intrusion, sir, but I have need of assistance, and your kindness and that of your Society to my children, have induced me to apply to you."

"Whatever we can do for you, madam, will be done cheerfully, I assure you," said Mr. Hammond.

"My son Norton has very unexpectedly fallen into difficulty. He is a member of one of the Mission classes, as you may know, sir, and I think that it is not from any perversion or forgetfulness of the teachings received here or from me that he is now under arrest."

Then the lady related the circumstances of the affair briefly and clearly, adding a few words in explanation of her own circumstances, which might become seriously embarrassed if she were compelled to leave her work for a few hours.

"I understand your situation perfectly, madam," said the kind but important Mr. Hammond, "and know the nature of the engagement to your present and future need. Employers at this time are most exacting; in their respective spheres they also feel the pinch of necessity, and on that account, demand the most thorough performance of the services offered them, and many accustomed to dealings with the poor accept no excuses for work undone at the appointed time. So many hands are ready to take work at prices little above starvation, that they can make their own bargains, and you must submit. I'll attend to this matter myself. It won't do for you, madam, to go down to the police station, not just yet, at any rate. I'll inquire into the affair, and see the police judge and the owner of the fruit stand, and perhaps we'll get the boy out pretty speedily."

"Oh, I thank you, sir, most heartily for this great kindness. If you see my son, tell him to be brave and truthful for his mother's sake, and if he will not be permitted to come to me, I shall be there to see him soon," said Mrs. Camp, earnestly.

"Yes, my good woman, now go back to your work and that little girl, and this young

chevalier of the *sans culottes* and I will do the needful. Young sir," said he to Bumpy, with a gravity which brought a half smile to the lip of Mrs. Camp, "I think you and I will make too strong a team for them down there."

"That p'leece judge's a buster on the boys wots tuk in by the cops," said Bumpy. "But I'm in for it with yer honor."

"All right, then, we'll go down in a moment. By the way, Mrs. Camp, I'm so often called upon in cases more or less like this, that I'm a little worn out as a bail man, that is, for serving as security. You understand. Do you think of any one who would be likely to take enough interest in your son to become his bail, should it be needed?"

Here our excellent Mission secretary showed one of his weaknesses or prudences, as the reader may consider it. He disliked to have his name appear on a bail bond or any other form of security for another. He would give liberally of his time in behalf of a charitable object or in a friendly service, but when asked to bind himself in a legal or documentary way, he either declined at once, or evaded it. In reply to his question, the anxious mother said:

"I do not know any one upon whom I could rely in such an event. Perhaps, sir, Mr. Stanley—do you know Mr. Stanley—of Taylor & Stanley? he might."

"Mr. Stanley I know very well, as he sometimes comes here to talk to our boys and girls."

"Norton is well acquainted with him, sir, and I think that he has a good opinion of my poor boy."

"Well, I guess Stanley would fill the bill, if need be. We'll go now, young sir."

Mrs. Camp pressed the gentleman's hand, and having requested the boy to come and tell her the result of the interview with the magistrate, returned to her apartments and resumed her intermitted work. Casting her eye toward the clock on St. John's, she saw that three-quarters of an hour had been consumed in this unexpected trouble of Norton's.

(*To be continued*).

WIVES AND SHOP-WOMEN.

WE hear much of the benefits resulting from the change in female employments; that women were once confined from ten to eleven hours a day in an unhealthy sitting posture, in order that they might earn half as much as they now can by standing behind counters, and enjoying the beneficial exercise connected with shop work.

Well, it's a comfort that the poor sisterhood have, in any measure, emancipated themselves from the destructive tendency of sedentary pursuits; but, at the same time, a very serious question arises, and one fraught with tremendous consequences to young bachelors especially. Where are the wives to come from? Good wives, you know, are always represented as a quiet, home-loving, darn-stocking-mend-old-coats sort of machines.

Now, do you suppose Miss Seraphina, who looks *so* sweet and tasteful behind that counter, doing up with her parcels so much small talk, and throwing into the bargain such bright smiles, is going to give up willingly this enviable public position, hide all her charms in a kitchen, with no one but husband to admire? By no means. If she marries, which of course she will, and commences housekeeping, there are nine chances out of ten, that in six months or less, she will get tired and blue, and begin with insinuating smiles, to talk to Robert about boarding. She will say, "You know if we board I can go back into the store and earn my own clothes at least"—not a small item either, dear Seraphina. Of course Robert stoutly protests for awhile, all the time secretly admitting that it would be cheaper, and at last says out, "Hang these housekeeping cares."

The result is, housekeeping is thrown up, the furniture sold at a sacrifice or stored, and pretty Seraphina rejoices in her becoming new bridal finery and ornaments, behind Mr. Buyandsell's counter; and Robert, instead of coming home to his wife of an evening, drops into the club-room or hotel,

to wait until Seraphina is ready to go home, for business is lively, and late hours rule, particularly Saturday evenings, when girls are tired out with their week's work.

After smoking one or two choice segars, and, perhaps, washing them down with strengthened water (I'm afraid I mistake, I guess the strengthened water comes first), he takes Seraphina to their boarding-house with a kind of dreary feeling that this is not just what he married for.

Sometimes it happens that Robert don't get around in time, and Mr. B—— or one of the gentlemen clerks escorts his wife home, and then Robert looks *glum*, and wishes he had not been in such haste to marry, and Seraphina cries and thinks he has ceased to love her, when poor, simple creatures they are only suffering the consequences of a false position. I say false, because although I believe women fully capable of filling, with entire acceptance, public positions, I as fully believe that the generality of them would be far happier as wives with a home of their own.

Undoubtedly a few young women seek these public situations from vanity and a love of excitement, but by far the larger part of them are forced to accept them from actual necessity, or because they are better paid than in other occupations. Forced thus into the exciting scenes of crowded stores or saloons, they insensibly imbibe a taste for this excitement until it seems to become necessary to their happiness; and I think this to be deplored, as it disqualifies them for the discharge of quiet, domestic duties—duties which in fact go so much toward promoting the welfare of society.

But tending store, or smiling behind a soda fountain, is all well enough, provided the poor girls are not expected at marriage to change at once from pretty poll-parrots to humdrum chimney swallows. Miserable females, what can they do? One day they listen to urgent appeals from consistent philanthropists, to leave their death-dealing sedentary employments and, perhaps, hear the next week, from the same lips, lamentable groanings about the degeneracy of the times, the lack of good stay-at-home wives, the extravagance of female dress, etc. Is this just, is it right? Can one go upon hot coals and not be burned? And can a young girl be placed just where dress and fashion surround her, where she is expected to take the lead in it, and not imbibe a destructive love of it? I tell you nay.

If men *will* select wives who have been for years surrounded by excitement and vanity, ought they to expect them, *at once*, to make frugal, notable housekeepers? Ought they to complain if the young wife has neither taste nor ability to discharge domestic duties? To all such grumbling husbands, I say *wait*, have patience. Do not conclude too suddenly that your marriage is a failure. If your wife loves you, she will, in time, conform to her lot; and, perhaps, make as good a housekeeper as she did a fascinating saleswoman. And to all young women employed as clerks I would say, when solicited to marry, weigh well your chances for happiness in the change from silks and laces to the broom and wash-tub, cook-stove, etc.; think of the white hand turning red and rough, and nobody but husband to dress for, and likely enough he never noticing it after all. And if you are sensible enough to believe that the love of an honest heart and a quiet home where you can welcome a friend now and then, are ample compensation for fine clothes, exciting scenes, or the admiration of a crowd, why, say yes to John when he asks *the* question. But of all things, if you do marry and settle to housekeeping—which pray heaven you will do, for boarding-houses are death to the real happiness of the married—*keep* to it. Bear patiently with the fire that won't burn, the half-done loaf, the muddy coffee, if you *will* drink it; the clothes-line that will break down just as you had all those clean clothes on it.

You will one day smile over all these little sorrows under the pressure of real ones, and wonder as you preside at your attractive board and hear the praises of husband and guest over your excellent dishes, if you ever did have such food on your table once. Patience, discouraged young couples through the first years, says

COUSIN CONSTANCE.

INDOLENCE IN LITERATURE.

PART I.

"He spake of beauty: that the dull
Saw no divinity in grass,
Life in dead stones, or spirit in air;
Then looking as 'twere in a glass,
He smoothed his chin and sleeked his hair,
And said *the earth was beautiful.*"

THIS character of self-complacency which Tennyson draws so adroitly reminds the writer how presumptuous an act it may be for one who does not present claim to a knowledge of the first principles of correct language, to assume the task of pointing out errors, or of furnishing guides for others who are pursuing a literary career in the face of difficulties. However, none better know what is wanting than those who feel need. But how to bend one's self so as to acquire and use the peculiar requisites, seems to be the unavoidable endeavor at which the majorities fail, and it is simply because they expect to make "the mountain come to Mahomet."

Writers do not often err by grasping more than they can handle, but they certainly do not handle skillfully that which they undertake so promisingly well. They find the real labor to be very unlike their ideal opinion of it. They manifest too strong an inclination to make an elegant pastime of that which they have determined must first be a profitable literary effort. The early idea of the aspirant to authorship is a rose-colored conceit that a literary *sanctum* is something between a lady's boudoir filled with exquisite art, rare curiosities scattered here and there with charming negligence, with an ambrosial atmosphere floating in the midst, and some grand Atheneum where the muses nine, and the *literati* many, ecstatically offer their combinate oblations to the shrine of Wisdom; a continuous revelry, they fancy, in bewitching enchantments and grand inspirations. Never arose a more extravagant phantasy—never disenchantment followed more surely than in the wake of this wild dream.

Were as great pains taken to obtain the practical facts regarding those who have climbed the intellectual mountains—reaching the highest heights of celebrity—as are nurtured to idealize, or rather artificialize their ascent, it would prove a wholesome lesson to the student; for it would be demonstrated that, without an exception, the world's towering men have dignified their conquests by the severest labor, the closest economy of time, and the most meager expenditure of personal recreative pleasure. Instead of praying for the clouds to disperse, and then waiting for the answer to their petition, they have lighted their candles and studied in semi-darkness. They found no excuses for delay, but were shrewdly aware that eternal perseverance would be the unavoidable cost of their conquests, while exactness could be purchased with nothing less than the most rigid discipline.

Greatness is not thrust upon any non-conductor; the idea that it is, is simply poetic, and not at all philosophic. The great bane of pure, energetic literature is largely attributable to slothful inactivity and irresponsible indecision. In the midst of the present intellectual increase, with its growing agitation of culture, there is a large percentage of listlessness; not positive inaction, but negative exertion. This would seem incredible to any person searching in a literary emporium for a treatise upon some subject to which he is giving immediate attention; for, no matter what the subject, when he looks for a half-dozen authors, he is much surprised to find nearer a half-hundred lights of different magnitude to illuminate his present study; and each volume, at first overlooking, seems to be laboriously exhaustive. Minutiæ have the appearance of being here extensively elaborated, and wide generalities there condensed. "What wonderful research; what insight; what indomitable perseverance in explorative qualities; what expression!" ejaculates the average reader, as he rapidly skims over the contents. He swallows words as he does his meat—without mastication, inviting indigestion, lunacy, and the doctors. The genius of an author is amazing to the illit-

erate, and they are disposed to look outside of the natural sphere of human qualifications for its origin. Indeed, is it not a common frailty with all to look upon that which we do not at all understand as something foreign to the ordained paths of life—something introduced for a special time and people?

Let us consider how wide apart are the criticisms of the novice and the so-called "expert," and we can draw our inferences therefrom of the medium or average mind. The opinions of the literary novice are sure to be enthusiastic, or he is no true servant to his cause. His is the exuberance of youth, although he may not be young in years. He indulges in overweening hope, and overflows with the effervescence of untamed imagination. He has the rushing, dancing, bubbling eagerness of gas when a lighted match is applied to the burner. He is impatient to "come out." His plethora of ideas need relief, and will abide no further restraint. Let him take up a book to read. "There is everything in a title," say some, and writers will spend weeks to make the "happy hit." If the title particularly impresses our inexpert critic—if it stands out from among other titles in bold relief, as a scarlet geranium blossom distinctly arises from the surrounding green—he is captivated by its elegance. Now if, happily, the general tone of the book is pure, yet confident—if mellifluous words flow unrestrained with quicksilver rapidity and ease—he fancies that equilibrium sits gracefully poised, angel-like, over the brain of the author. If, on the contrary, there are strong words, unmusically strung, and he can not connect the long sentences so as to get the thread of the writer's thoughts, he takes it for granted that the subject-matter is profound, and far-reaching beyond his present mental caliber, and he resolves to lay it up as a work of high art which he shall learn, as he progresses, to appreciate. He detects no flaws, because he looks for none. He suspects no irregularities or inconsistencies, because he is eager to get at wholeness, originality, and unconditional truth. Character, to him, is either white or black, and the most pretentious wins his admiration. Principles and purposes are all right or all wrong. He sees distinctly the scarlet of the blossom and the green of the grass, carries them in his eye, and declares these are the only two colors that were presented. He does not seem to be conscious of the drapery of gray air, of the golden sunlight flecking the dew with opals, of the earth colors; and that repose, contour, and symmetry lie within the boundary of his mental picture, bringing to lively prominence the contrasting hues of the scarlet and the green, and enhancing their brilliancy and beauty. He is ready for perfection in one mind, and is ready to applaud something that is just glowing under favorable recognition by superior people. Not allowing himself to be one whit behind these "extraordinaries" in enthusiasm, he launches his opinions as if they were *Great Easterns*. So much for the novice, with whom, let it be remembered and acknowledged, every *litterateur* has been peculiarly acquainted, and to whom he or she has been more or less warmly attached in some of the experiences of the past. Why blush? There are greater follies than these.

The expert is the adverse of the novitiate. He has no cause at heart, for he likes not half so well to uphold or upbuild as he does to pull down, and roll, and trample, and degrade in the common dust. He has

"A mind well skilled to find or *forge* a fault;

and he is viciously happy in being "hated, yet caressed" by those who fear his cutting satire, his insolent ridicule, and his cold, measured scorn.

Having briefly sketched the inflammatory susceptibilities which adhere to the extreme ends of the critic's bench, thus demonstrating the unreliability of the unreasoned judgments of both novice and "expert," we will turn back to give a few reasons for charging average mental "geniuses" with slothfulness. The reader must remember that in this paper we are confining ourselves to the faults of literature and its manufacturers, and they can not be discussed as pleasantly as the fairer and more successful phases. In the first place, then, the profusion of literature—and it is immensely profuse—is commonplace, tame, and weari-

some; or, avoiding this, it is sensationally loud, and alarmingly excitative in its over-strained representations. It disappoints—where it does not cloy—by abruptly dropping the unwelcome curtain exactly when the reader is prepared for an original elaboration which shall enlighten him. It lures him to the mouth of the cave of the greatest scientific wonder, then assures him there is no way to enter—"No steps, no window or door, no study, no psychological opening to admit him to the 'unknowable!'" Its biographer turns autobiographer, and arranges the light so that it may shine most advantageously upon himself by reflection, little concerned about the exactness of his biographical picture. It invites the reader to some historic treat, and puts upon his credulity the cheapest slander, the most outrageous misrepresentations that partisan trickery and blind radicalism can put in circumlocution; or, on the other hand, robs thousands of their bravery, or magnanimity, or humanity, to dress up one hero, whose conscientious shoulders are so broad that they can carry all the honors that can be surreptitiously loaded thereupon. Its ethics threaten to stir and clarify the stagnating pools of self-love—to disturb the evil-doer—and they straightway lull him into self-complacency with their plausible moralities. Its poetry, profuse in quantity, keeps the listener alert for some new chord of sweetness—for some deep intonation that will vibrate in unison with his most sacred sense of love and life—and he is pained with hollow sounds, and mockery that distorts the real. Artificially it attempts to sing; and whines—to soar; and envelops itself in the blurry shadows of mystification, or entangles itself in the splendor of the stars, and can not get back to earth and reason to complete its attempted mission. The traveler by rail rides but a few hours before he finds two, three, or four novels lying in his lap. From the imposing "muslin-bound," in the newest colors, to the glaring, vulgar paper covers—they are all the "latest," and generally worse than their predecessors. In contents, they are true to the artificial, and false to the real. There is seldom one good thing in them to stick to the intellectual memory. But traveling wayfarers and free public libraries make ready markets for them. People who "have a passion for reading" will read anything for habit's sake.

Some one has remarked that "'Uncle Tom's Cabin' and Harriet Beecher Stowe have made each other monumental;" but the same writer adds this severe criticism, that "Mrs. Stowe's later productions are common tomb-stones." This is putting the case rather stoutly against an individual writer—but are not the public the greatest sufferers by this universal fault of famous authors, who sail so fast that they can carry no cargo? Voluminosity ranks high just now; and it pays—pecuniarily. Now and then some one takes up the pen—there is one volcanic eruption, one mighty disgorgement of the over-burdened accumulation—and the intellectual mountain sleeps again! But these two extremes scarcely enlighten the people as to what is going on under the careful hands of conservative thinkers and writers. These latter are accredited chiefly with slowness and dullness. They do not make "brilliant" discoveries, and then startle the world, just as it is settling down to their adoption, with some new theory that overturns and outrides the old ones. They never arrive at "final conclusions," and consequently have no jubilee. And so the people turn their backs to them. They seek no applause—need none, get none.

Yet fame has its uses. Appreciation is one of the indispensables to public usefulness, and justly so. A full burst of unanimous applause induces the streams of wit and wisdom to flow glibly. A "top round" of popularity stimulates the writer or speaker to graciousness, and makes him "do the agreeable" as if it were wholly innate. Together they strengthen his consciousness of ability, and steady his will to the task which is before him. They uplift him above fear, and he can afford, under public favor, to be both catholic and candid. They clear his vision to high susceptibility, and make him impressively eloquent. They bring him *en rapport* with his audience, and through that truly wonderful agency—the magnetism of sympathy—he anticipates their wishes, their intellectual tastes and capacities, and,

before they are aware they have asked, gives them something for their needs. But the summit of his glory is often reached by the writer to be immediately descended from. The honest praises of the people losing their fresh impetus, shift to adulation, which crazily runs on to the very limits of language. The author's ambition, and perhaps his vanity, is nurtured with this as recompense. Poor food for a sensitive soul to feast upon! It intoxicates while it poisons. He is diverted from the goal of his early purposes. His taste loses its native purity. The world is greedy and clamors for something more and else. Alas! it is here that "poverty, the mother of invention," comes in, and a "French dish," of the odds and ends of little extravagances of the past, is the pitiable result. The demand has become so great that he pays little heed to the quality of the supplies. The keen, straight edge of his Conscientiousness blunts; the fine temper of his thought hardens by the excessive heat of excitement, until it has grown brittle, and it carves the meat of truth with less nice lines than was its wont. The epicure's wine grows sour; his moral bread grows stale; the fruit of his mental labors is not so sweet or fresh as of yore.

ROSINE KNIGHT.

I DON'T KNOW.

SIMPLE enough the words sound, and easy of enunciation, certainly; but their utterance, with a great many people, requires the essence of courage, extracted and boiled down. Especially does the professional character regard their use as obsolete; and it is amusing to notice how many clever phrases he invents to supersede this plain and honest confesssion, "I—don't just remember. Can't say—exactly; 'pears to me I *ought* to know, too; but—well, really, I have forgotten!" when the facts in the case are, he don't know, never did, and the probabilities are that he never will.

Perhaps the cause of so much martyrdom of conscience, especially in the case of those who are brought by force of circumstances into more conspicuous notice in society is the fact that illiterate persons, knowing nothing of the incessant grinding requisite to polish the diamond, expect a few rubbings against seminary walls to bring out the jewel in all its resplendence; and the jewel, desirous, of course, of a rich setting, assumes the position allotted by ignorance, and consents to shine with a false lustre, making it hard for a less pretentious gem to obtain any setting at all.

The school-teacher is regarded by a certain class as a public lamp of information whose rays are to illumine even the most obscure caves and dells of ignorance.

An illustration of this assertion once occurred in the case of a young lady who went into a certain district in the State of Illinois, "to teach the young idea how to shoot."

The good people with whom she sojourned were puzzling over the question of the county-seat of a certain county in the State of Indiana. The question being referred to her, she innocently made answer, "I do not know." "What! you a schoolma'am and don't know *that?*" was the astonished outburst. That lady subsequently advised us never to say, "I don't know," if you want to be popular.

We do not deny that we have sometimes acted on the plan of her advice, but we do not consider it good for the conscience. We can not indorse the sacrifice that lays truth and honesty on the altar of popularity. There are many, many things in regard to which we must be content to remain in life-long ignorance.

The more we learn, and the more extended and widened our views of life become, the more sensible do we grow to the fact that our knowledge is as but a drop drawn from the great ocean of truth, which would scarce make a ripple on its surface.

Then let us be courageous, and not fear to bring the frank avowal of ignorance into our vocabularies.

"I don't know" is a legitimate expression, and is applicable in more cases than any similar combination of words in the English language.

MINNIE MYRTLE, Jr.

Department of Literature, Science, Education.

True philosophy is a revelation of the Divine will manifested in creation; it harmonizes with all truth, and can not with impunity be neglected.

LETTERS TO A SON IN COLLEGE.

No. VIII.

THE SYSTEM OF SPECULATION AND THE SYSTEM OF REASON.

MY DEAR BOY:—I was very much pleased at receiving your letter recounting the difficulties which you experienced in your study of mental philosophy, because it shows that you have taken a very intelligent interest in a most important subject.

You were not unreasonable in expecting from the study of mind results as practically useful as those which you have derived from the study of physiology; only the advantages which may be derived from a correct exposition of the facts and principles of mind, are as much superior to those which you have received from the study of the physical system, as mind is superior to the mere tenement which it inhabits. The study of mind must appear pre-eminently important, if it really has a definite constitution, and is governed by fixed laws, and if, by becoming familiar with that constitution, and yielding obedience to those laws, we may contribute to the development of the noblest characteristics of this most exalted portion of our nature. And not only would a thorough acquaintance with our mental constitution contribute to our advancement as individuals, but in all our civil institutions, in all our systems of education and schemes of benevolence, and social reform, we can have no certain and reliable principles for our guidance but those which may be derived from a correct exposition of the true philosophy of mind.

Governments are established that the interests of the individual may be promoted by the combined efforts of the many in the establishment of legislation for the practical direction of the conduct of the individuals forming the compact; in other words, for restraining and regulating the mental faculties in their efforts at gratification. But laws to regulate the activity of those faculties must be framed in accordance with their nature. And how can they be so framed unless the mental faculties are known and clearly defined, and the constitution which their Creator has imposed upon them be thoroughly understood. The training and education of youth are directed almost exclusively to the mental faculties, and unless these be known, and the laws which govern their activity be understood, our efforts at training them must be empirical and unreliable. Criminals and paupers are such chiefly because of the peculiar constitution of their mental faculties. And in order to be successful in the reformation and elevation of these classes, our efforts must be based upon a correct understanding of the nature, laws, and modes of activity of these mental faculties. Idiocy and insanity also are caused by mental deficiency and disease, and to be successful, any treatment for the amelioration of the condition of these unfortunates must be founded upon a knowledge of the facts and laws of the mental constitution. Morals and religion to produce the most beneficial results must operate in accordance with the constitution of the mental faculties; but so long as there is no unanimity among men in regard to the very fundamental principles of mental science, we must expect to find the world divided, and the efforts of the best men to a great extent nullified by the

most conflicting creeds, theories, and dogmas, in regard to questions which concern the dearest interests of mankind.

If mind can be resolved into its constituent elements; if those elements are governed by definite laws, and if those laws may be discovered, and reduced to practice in training, developing, guiding, and controlling mind, then indeed does mental science become the most useful and interesting study which can engage the attention of man. For mind being the motive power of the world, the source of every influence for good or evil which can be exerted in society, we can not hope to make intelligent progress in our governments, laws, and social institutions till we shall have mastered the principles of mind and the laws of its activity. If, on the other hand, the principles of mind are so inscrutable that their investigation possesses no attraction for any but a few of the very best minds; if they are so abstruse as to be adapted to excite barren speculation, rather than to furnish correct motives for the practical direction of human conduct; then mental investigation becomes merely an intellectual pastime for those who delight in metaphysical subtilties.

If we inquire into the results which have flowed from mental investigation after the old methods, we will find them neither profitable nor encouraging, though the study of mind has engaged the attention of the best intellects of every age since the early Greek philosophers. One system of philosophy has risen from the ashes of a previous one, and this in turn has been subverted by the philosophers of a succeeding generation. What has been affirmed of mind by one school of philosophy has been denied by another, and after the lapse of more than two thousand years there is yet no unanimity among philosophers in regard to the very existence of some of the most common principles and faculties of mind. This result of the efforts which have attended mental investigation is well summed up by M. De Bonald. "Diversity of doctrine," says he, "has increased from age to age with the number of masters and the progress of knowledge; and Europe, which at present possesses libraries filled with philosophical works, and which reckons up almost as many philosophers as writers, poor in the midst of so much riches, and uncertain with the aid of all its guides, which road it should follow; Europe, the center and focus of all the lights in the world, has yet its philosophy only in expectation."

If we inquire into the cause of these barren results, I think we shall find its explanation in the very method of studying mind which your text-book recommends, namely: by shutting up the organs of sense, shutting out the material world, and shutting in the mind upon itself. Metaphysicians have pursued the investigation of mind as though it were an entity almost entirely separate from the body. They have endeavored to hold the mind out like a garment to its own inspection, and turn it round on all sides to its own observation, and by reflection on consciousness to analyze and classify its principles and faculties. But in the present life we are not acquainted with mind and body as two distinct and separate entities, and we can not study either to advantage apart from the other. Of what practical use do you suppose would be a treatise on the five senses which would wholly ignore the existence of the organs through which they are manifested? And what confidence can we place in any system of mental philosophy which studies mind as a disembodied spirit, when the experience of every hour reminds us of the fact that every mental manifestation is affected in a greater or less degree by every bodily condition? But you will be able to appreciate better these observations on the old method of studying mind after I shall have unfolded to you a method which has come under my notice since, like yourself, I puzzled my brain over vain attempts to get some useful ideas out of the philosophy of the schools. I will do this in a series of letters, which will, I hope, relieve me from the task, for which I profess myself wholly incompetent, of resolving the difficulties which you have presented to me for solution.

In considering the mental characteristics of men, we are struck with the great diversity of talent and disposition which they

present. Every individual displays a character which is peculiarly his own, and which differs in a greater or less degree from that of every other individual. Thus in point of intellectual ability, or capacity to know, as your philosophy terms it, we observe that one individual has a peculiar talent for mathematics, another for music, and another for drawing and penmanship. One is able to express his ideas with great fluency, and another passes for a dullard in society because of his inability to give his thoughts expression. The style of one is concise, ornate, harmonious, and abounding in well-chosen illustrations; that of another is dry, diffuse, obscure, and wholly devoid of grace and beauty. One loves to reflect upon the deep and hidden things of nature, and to trace the various phenomena which he observes back to the causes from which they originate. Another readily discerns the mechanical adaptation of things, and turns his reflection upon the phenomena which they present to the invention of labor-saving machinery. Another discovers in every appearance of nature forms of beauty, which he portrays in words which glow with fancy and imagination. And another sees nothing in the objects which exist about him but their most obvious qualities.

In moral character and disposition, also, we observe equally as great diversity as in intellectual capacity. From the noble philanthropist, glowing with love and charity toward his fellow-men, to the base criminal who lives in continual warfare with the officers of justice and the rights of society, what opposite phases of character do we discover? Here, one strictly honest and upright; there, another whom no man will trust. Here, one in appearance fair and fascinating, but in reality a villain; there, another blunt and gruff of manner, but who scorns to do a meanness. Here, one diffident and sensitive; there, another bold and confident. Here, one proud and haughty; there, another humble and fawning. Here, one unstable as water; there, another whom no difficulty nor reverse of fortune can swerve from his purpose. Here, one generous and liberal; there, another mean and miserly. Here, one a natural brawler and fighter; there, another a natural peacemaker. Here, one a firm and constant friend; there, another deceitful and treacherous in his friendships.

Such are some of the common characteristics which we observe among men. It is to be observed, also, that these characteristics are constant. Among your college companions, you do not find that the student who at one time manifests a strong predilection for mathematics, music, the languages, chemistry, or philosophy; at another, has lost all taste for his special study, or that he suddenly acquires a great liking for certain subjects for which he previously showed no aptitude. Neither do you find him who, in one year, is well known for his fidelity and truthfulness, becoming in the next treacherous and deceitful; nor him who to-day is tremblingly alive to the voice of praise or censure, becoming to-morrow callous to the opinion of his fellow-students. But each individual manifests his peculiar character with such uniformity that after we have become thoroughly acquainted with him we are able to predict with considerable accuracy what will be his conduct under any given circumstances.

These talents and dispositions, it is to be further observed, are not the results of training, education, and the circumstances in which the individual is placed, as many philosophers assert, because these traits are often manifested at an age so early that the possibility of their being the result of any of these influences is altogether precluded. Mozart, for instance, composed music at the age of four. Pope says of himself, that he "lisped in numbers for the numbers came." Benjamin West, when a mere child, sketched accurately the portrait of his little sister sleeping in her cradle, with a brush made of hair pulled from a cat's back, and George Bidder was a profound mathematician before his father supposed he knew anything about mathematics.

Great mental capacity in special directions is also often manifested by individuals who have never enjoyed the advantages of early education, and whose circumstances have been, in other respects, most unfavorable to mental development. How many a

man, born to poverty and toil, has risen against the most adverse circumstances to wealth and fame by the force of his own inherent genius. And how many another, born apparently under the most auspicious star, has never risen above mediocrity in any pursuit or branch of knowledge even with the best training, the best education, and under the most favorable circumstances.

Considering the matter in the light of these well-known facts, I think the conclusion is irresistible that the common characteristics which we observe among men are inherent in the mental constitution, and from their great diversity I think it not unreasonable to suppose that they should have separate and distinct mediums of manifestation. What, then, are these mediums? and what is the cause of this great diversity of talent and disposition? These are questions which it is important to resolve before we can have a substantial basis for mental philosophy; yet, they are questions which have hitherto excited barren speculation, rather than led to discoveries productive of practically useful results.

The ancients located the affections and passions in different organs of the thoracic and abdominal viscera, while they referred the intellect to the brain. Thus the heart was regarded as the organ of courage and love, the liver of anger, the spleen of ill-humor, and the bowels of compassion, while the brain was divided into different compartments, as fancy, reflection, common sense, imagination, memory, etc., as the imagination led them to conceive a place appropriate to the different mental faculties. By others, the stomach, the ventricles, the spinal marrow, the pineal gland, and the cerebellum have been severally regarded as the special seat of the sentient soul. Some modern philosophers have taught that beyond its perception of material objects there is not the slightest reason for supposing that the mind ever operates through the agency of any material organs whatever. Your philosophy, I believe, does not commit itself in any very decided terms upon this important question. It simply says, "That the connection of mind with the body and thus with the agencies of an external world are mediately through the nerves, and their origin is in the brain and its elongation in the spinal cord."

It thus leaves you to adopt any hypothesis you choose in regard to the special seat of the mind. This neglect, whether intentional or accidental, is, I think, reprehensible. For, if your philosophy assumes that the brain is the organ of mind, as is generally conceded by the leading physiologists of the present day, it appears to me that its treatment of the subject is very incomplete without a consideration of the physiological conditions by which mental manifestations are affected. If, on the other hand, it assumes that the brain is not the organ of mind, or that with the exception of the organs of sensation, the mind never operates through the agency of any material organ whatever, then it should have cleared away the formidable difficulties by which these hypotheses are surrounded.

If the brain be not the organ of mind, what is its function? Is it, as some old physiologists have asserted, a mere excrescence of the spinal marrow, a sponge, a collection of confused intestines, or a bloodless mass which tempers the heat of the heart? Or is it not much more reasonable to suppose, since it receives a larger proportion of blood, and is more carefully protected than any other bodily organ, that it must have a correspondingly important function?

It has been observed by Cuvier, Blumenbach, and other leading physiologists that in the animal kingdom the brain improves in form and relative size as we ascend in the scale of intelligence, till in man it reaches a development as much superior to what is found in the lower animals as he is superior to them in intelligence. Even among men, the size and quality of the brain differ greatly, and it will be found that the mental manifestations vary in a corresponding degree. Where the brain is below a certain size, idiotism is the invariable result, while men renowned for comprehensive minds and great force of character invariably have heads of unusual magnitude.

If the brain be not the organ of mind, how are we to account for the various men-

tal disturbances which accompany affections of this organ? Consciousness is suspended by a rush of blood to the head as well as by a rapid withdrawal of this natural stimulus. Fever is often attended with delirium, and a blow on the head deprives a person of consciousness. Where the brain has been laid bare by injury, it has been found that consciousness could be suspended by pressure on the brain, and restored by removing the pressure. And where the skull has been depressed upon the brain, imbecility or complete unconsciousness have resulted. Sir Astley Cooper relates that a man on board a vessel in the Mediterranean was wounded in the head by a fall from the yard-arm. He remained in a state of complete insensibility for a period of thirteen months. He was then trephined, and a portion of the skull which was driven in upon the brain was removed. He was immediately restored to consciousness, and in a few days was as well as ever. The last thing he remembered was the capture of his vessel thirteen months before.

Where a portion of the skull has been removed so as to expose the brain to view, it has been found that the brain is agitated in proportion to the degree of mental activity. Dr. Combe quotes a case of this sort from the practice of Dr. Pierguin, of Montpelier:

"A female, aged 26, lost a large portion of her scalp, skull, and dura-mater. A corresponding portion of her brain was consequently bare, and subject to inspection. When she was in a dreamless sleep, her brain was motionless, and lay within the cranium. When her sleep was imperfect and she was agitated by dreams, her brain moved and protruded without the cranium, from cerebral hernia. In vivid dreams, reported as such by herself, the protrusion was considerable; and when she was perfectly awake, especially if engaged in active thought or sprightly conversation, it was still greater."

Again, if the mind acts perfectly independent of material organs, how is insanity to be explained? Is it reasonable to suppose that the immaterial and immortal mind becomes diseased? What a degrading view of spirit such an hypothesis presents! And how are we to reconcile the idea that the mind may become disordered with our belief in the soul's immortality? Is it not much more reasonable to suppose that it is the organ through which the mind acts which becomes diseased, and which thus causes a perverted mental manifestation? If a man's sight or hearing were impaired, would he not be judged a lunatic who should assert that the defect was in the mind and that remedies to prove effectual must be applied to the immaterial spirit? On the contrary, is it necessary even to assert that the functions of sight and hearing are entirely dependent upon the organs through which they are manifested, and that to preserve or restore the integrity of the function we must obey the physiological laws which govern the health of the material organ? But as matter of fact, in nearly all the cases of late years where examinations have been made it has been found that disorder of mind has been attended with disease in the brain. Out of 221 cases of insanity, Sir William Ellis found the brains of 207 diseased, 4 of the remainder were idiots from birth and are consequently excluded, and of the remaining 10, 7 were recent cases, being only about a month ill. In 108 cases of insanity where post-mortem examinations were made by Mr. Laurens, of London, every one showed marks of organic disease. These cases furnish additional evidence that the brain is the organ of the mind, as well as that the mind does not act independently of a material organ.

In sleep and intoxication, also, are we to suppose that it is the mind which rests and becomes drunken? Can we conceive of an immaterial spirit needing repose or becoming intoxicated? But how easily are these phenomena explained by referring them to the organ through which the mind acts; which going into a state of repose or being excited by intoxicants or stupefied by narcotics causes a corresponding condition of the immaterial principle.

These proofs that the mind does not act independently of a material organ, and that the brain is the organ through which it acts, are so self-evident that you may wonder that I think it necessary to produce them or

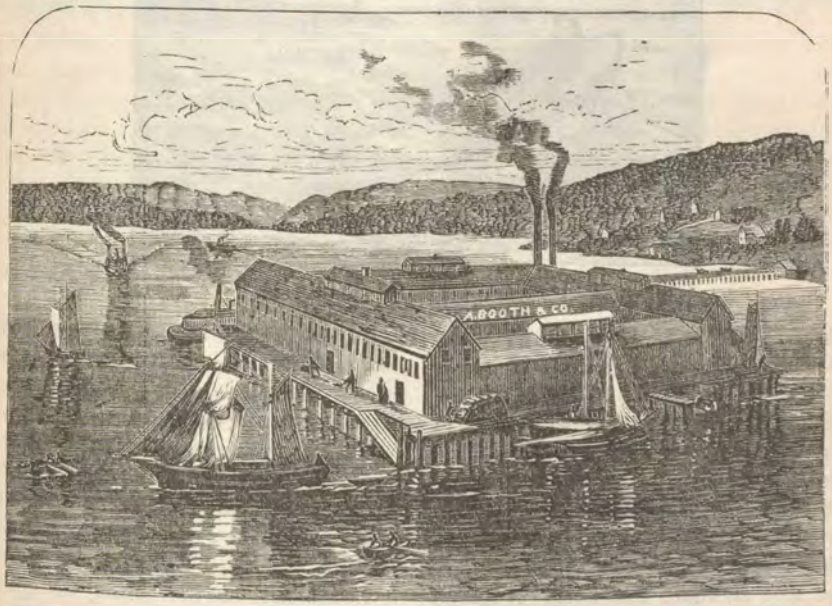
that any one should found a system of mental science upon hypotheses which they so completely contravene. In explanation, I would say that you have yet to learn, if you have not done so already, that there are very few men who are capable of rising above their preconceived opinions, and the creeds and dogmas in which they have been educated, and considering dispassionately any new notion which militates against their previously formed opinions, however clearly grounded in the truth those notions may appear to unbiased minds. If, for instance, a man becomes affected with the idea that if the mind operates through the agency of material organs, his life-long belief in the soul's immateriality and immortality, and man's accountability are called in question, he will turn a deaf ear to the most indubitable facts which any one can advance to prove that the mind does act through material organs. The honest seeker after truth, however, does not inquire as the condition for accepting any new fact, Does it accord with my creed and the opinions in which I have been educated? He simply asks, Is it true? If it is true, then am I correct in my inference that it contravenes my previously formed opinions? If I am correct in these, then must I renounce those opinions as erroneous; for truth is single and harmonious, and can be opposed only to error.

I wish you to cultivate this spirit of liberality in the consideration of all questions which may engage your attention. The histories of science, philosophy, and religion are filled with instructive examples which illustrate the evil results to the progress of the truth of individuals, sects, and schools, clinging blindly and pertinaciously to their creeds and dogmas, and dismissing as unworthy of candid consideration any subject which appeared to militate against their own pet theories. He who is wise will condemn no subject which he has never investigated, and he must indeed be affected with the most egregious vanity who, in looking back over the history of the past, and considering the many brilliant intellects whose carefully elaborated theories the progress of knowledge has completely overthrown, can self-complacently wrap about him the mantle of his own narrow prejudices, and ignore or heap ridicule upon any subject which appears hostile to his favorite opinions, but whose truthfulness he has never taken the trouble to investigate.

Affectionately yours,

PATER CONFIDENS.

THE OREGON SALMON FISHERY.



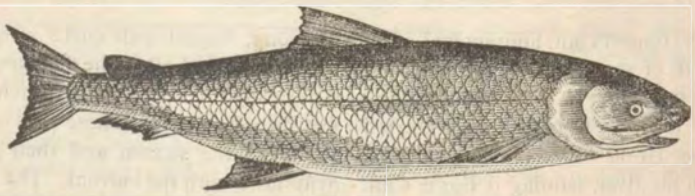
THE copious supply of preserved or canned fish which comes to the table of the consumer on the Atlantic seaboard, and which is due to the enterprise of many companies and individuals in sweeping the rivers of Oregon, deserves more than passing comment. Some years ago it was mooted, that in fish elements exist of special service to the brain and nervous system. This idea has been discussed *pro* and *con* at great length, and the majority of people appear to have accepted it. Certain it is that among the fish which contain phosphoric matter in considerable quantity, the salmon is prominent, and this species of the finny tribe is one of the most highly esteemed of fish by epicures. But its cost, until the introduction of Columbia River stock into Eastern markets, was too great to admit of being used as an article of food by the general population. Previously the chief source whence was derived the salmon supply, was the upper waters of Maine, and they becoming gradually fished out, the price has been correspondingly advanced. The application of the methods of preserving and canning at the fisheries of Oregon materially changed that state of things for us, and now they who are carnivorously given, in a small or large way, may gratify their appetite for salmon at an expense scarcely exceeding the cost of the common varieties of fish furnished by our markets.

Salmon catching and canning on the Columbia River has become a vast industry, employing upward of ten thousand people. The value of the produce exported will probably reach this year five millions of dollars.

Last year 40,000,000 pounds of salmon were caught on the Columbia River. The London *Times* has estimated that the total catch of Great Britain and Ireland for 1876 was 9,000,000 pounds. Thus, according to that calculation, the product of one Oregon river was more than four times the catch of the whole United Kingdom.

A short sketch with regard to the beginning and growth of this industry will probably interest the reader. The first salmon canned on the Pacific coast came from the Sacramento River, and were put up at Washington, opposite the city of Sacramento. Old trappers and hunters had often spoken there of the wonderfully large and fine fish to be caught in the Columbia River; and in 1865 Mr. George Hume started for that then far-off country and secured a location on the river, naming it Eagle Cliff. There suitable buildings were erected, and apparatus transported from the Sacramento River, and the first cans were filled in 1866, by the firm of Hapgood, Hume & Co. This firm finally dissolved, each member starting a separate establishment. Nearly every year subsequent to that saw the erection of at least one new building, and the starting of a fresh enterprise. The general appearance of these canneries is much the same; our illustration of one at Astoria will furnish a good idea of it.

The fish season generally lasts from May until August. The boats usually leave at 4 P.M., and return between 4 and 6 o'clock the next morning. The fishing is mostly done at night, the salmon knowing a net when he sees it, and avoiding it in the daytime. The boat's crew—see engraving—consists of two men, one for rowing and the other for manipulating the net. These nets are from twelve hundred to fifteen hundred feet long, floated with corks weighted with lead, somewhat after the fashion of the ordinary shad net, and fall as much as twenty feet into the water. These nets are stretched across the stream and then allowed to drift down with the current. The fish swimming against the stream are caught by their gills becoming entangled in the meshes. Immediately after the fish are caught, if not drowned in the net, they are killed by a blow on the head. The fish are large, weighing on an average twenty pounds. As soon as possible after they are delivered at the wharf of the cannery, they are prepared for the



A Fishing Station, Columbia River.

cans. Those who clean the fish become, by reason of practice, exceedingly dexterous, and very rapidly open and disembowel the fish. In some of the canneries the head and entrails are not thrown away, but converted into a very good article of oil. Each can is filled with a bit of fish, just about occupying its interior space, and a very small amount of brine is put in with it. After the can has been sealed, it is placed with others in a steam boiler, where the fish undergoes a cooking operation for an hour. Then, in order to permit the gases to escape, which have been generated by this cooking process, a hole is pricked in the top of the can, and soon afterward resoldered. A second cooking now takes place, when the culinary part of the business is ended. The cans are taken from the boiler, and a shower of cold water is thrown upon them. That they are perfectly tight, is shown by the way the top of the can bends in.

SALMON FISHERS AT WORK.

The question naturally suggested itself, will so great an industry be permanent? The large firms on the Columbia River have invested several hundred thousand dollars in the business, and so far, during the operations of the canning establishments, the draught of fishes has practically remained the same. There are prolific seasons with fish as with fruit or grain, but early settlers in Oregon declare they have noticed no perceptible diminution in number, taking one year with another. The Indians located around Astoria state that the fish run in the Columbia to-day as they did thirty years ago. The cod fisheries off Newfoundland, and the herring fisheries of Scotland, have been steadily drawn upon for hundreds of years, and still keep up their supplies. So it may fairly be anticipated that the salmon fisheries of the Columbia will remain an important industry of Oregon for a long time.

THE COLUMBIA RIVER SALMON.

LOUIS ADOLPHE THIERS, EX-PRESIDENT OF FRANCE.

THE sudden death of M. Thiers has produced wide-spread excitement and grief in France. His long association with the political history of his country, his advocacy of liberal government, and his exceedingly wise administration of affairs as President during the agitations which succeeded the fall of the Second Empire, had given him a solid place in the esteem of his countrymen, second to that of no other living man. Hence it is but natural that his taking off just now should be considered a great national misfortune.

He was born at Marseilles, April 16, 1797, the son of a locksmith, and educated at a public school. He aimed to be a soldier, but his desires in this respect not being approved, he was sent to the College of Aix, where he studied law. He possessed an excellent vital organization and an exuberance of animal spirits, and was so very much given to frolicsome ways that he troubled the authorities of the college considerably. His good nature and earnestness, however, in the end won their esteem, and through their influence it was that he first obtained his seat in the French Parliament. He did not succeed as a lawyer, so he forsook the law and took up the profession of literature, and set to work industriously to acquire a good position. In a comparatively short time he obtained recognition as a promising writer. He wrote for *Le Constitutionnel*, displaying great acuteness and much skill. In addition to his journalistic labors, he wrote a history of the French Revolution, the first volume of which was finished in 1823, the tenth and last in 1832. During the reign of Charles X., M. Thiers exhibited a good deal of spirit in opposition to certain unconstitutional acts of the king and his leading minister, Count de Polignac. About the year 1830 he was elected member of the Parliament for Aix. In 1832 he was appointed Minister of the Interior, but shortly after resigned that post for the place of Minister of Commerce and Public Works, which he held for several years. In 1836 he became Minister of Foreign Affairs, and President of the Council. After a brief service he retired, but again took the former position in 1840. Some unfortunate meas-

ures of diplomacy led to his retirement to private life and to the exercise of his literary talent, when he began his "History of the Consulate and Empire," which was not finished until 1862—a very elaborate work in twenty volumes, the first appearing in 1845. He remained in seclusion until the opening of the Revolution in 1848, when he appeared as a member of the National Guard. He soon, however, became a member of the Constituent Assembly, and afterward of the National Assembly.

Thiers professed to accept the Republic heartily, but President Napoleon did not give him an office, as was expected, and after the *coup d'état* of December 2, 1851, he was banished from France, going to Switzerland, but shortly afterward was allowed to return to Paris. For the next twelve years he employed his time mainly in literary affairs, giving some attention to painting and the fine arts in general. In 1863 M. Thiers was elected by the Liberal opposition a Deputy for the Department of the Seine. Here the little man showed his customary vigor and persistency by attacking the financial administration, the municipal policy of Baron Haussmann, and the Emperor's foreign system. Some claim that his taunts and criticisms were among the principal instigations to the conflict of 1870. When the war with Germany became inevitable, he delivered a speech in which he charged the Government with rushing headlong to destruction, being altogether unprepared for war. Its early reverses made him very conspicuous on account of the brilliancy of his harangues for the defense of France against the invader. He voluntarily undertook diplomatic missions to England, Russia, Austria, and Italy to solicit aid. He visited London September 13, 1870, and conferred with the English Ministry. Subsequently he visited St. Petersburg, Vienna, and Florence. His efforts, as well known, failed, and returning home in October, he thence proceeded to the headquarters of King William, at Versailles, to negotiate a peace in accordance with the advice of the neutral powers. He held several diplomatic conferences with Count Bismarck, with a view to secure an armistice of twenty-five days, so that elections might be held throughout the country for the establishment of a national government. These conferences failed, because Bismarck refused to allow the re-victualling of Paris and other besieged fortifications.

In spite of his unsuccess his popularity with the masses increased, and one of the first acts of the National Assembly, after it had obtained control of Paris, was to confer upon him the leadership of the Provisional Government. On February 28, 1871, M. Thiers introduced the preliminaries of the famous Treaty of Paris for the consideration of the Assembly. It was by this treaty that France consented to have annexed to the German Empire the fifth part of Lorraine, together with all of Alsace, excepting Belfort, and to pay the enormous sum of five milliards of francs, of which one milliard was to be paid that year, the remainder during the next three years by installments. This treaty was voted by the Assembly, on compulsion, it may be added. After the terrible scenes of the Commune and the recovery of the city by the Government army, the peace policy of Thiers was strengthened by the supplementary Assembly elections, which resulted in a very large vote of confidence in his leadership. His authority was enlarged, and his title changed to that of President of the French Republic. On the 24th of May, 1873, he resigned the Presidency, on account of the existence of a majority of the Assembly against certain measures of his, and Marshal McMahon succeeded him.

Like most little men, he was strongly ambitious for notoriety and distinction; sprightly, lively, and jovial. He was also brave; had a very active sense of honor; was not a radical in his views, and would never go beyond the length of what he termed *les libertés nécessaires* in his views of reform. He was a Frenchman of the old school, scrupulous, prudent; declining and refuting new theories from whatever source they might come. He loved fun intensely to the last; his head is particularly marked in the region of Mirthfulness. His practical jokes sometimes approached buffoonery. A writer says: "It is a curious commentary on national manners that so

nimble and volatile a person should have been considered one of the most serious men in France." The Legitimists blamed him for having employed the Secret Service funds under his control to buy the conscience of one Deutz to betray the Duchess de Berri to the Government of Louis Phillippe. This was undoubtedly an unchivalrous proceeding, but it was also a shrewd one, for it put an end to the Revolution which was keeping La Vendée in flames and disturbing the peace of Europe.

His death was occasioned by congestion of the brain, the attack coming on while at luncheon. He had contracted a slight cold a few days before, but nothing was thought of it. He was of full habit, with very active vital functions. His habits were simple; he rose early in the morning, took two short naps during the day, and was remarkable for his intellectual industry to the last, being thought likely to live many years longer. M. Thiers' confidence in his physical endurance was probably too great, and led to effort and exposure beyond what was proper in an octogenarian. In fact the real and immediate cause of the apoplexy is claimed to be a more than usual mental activity on M. Thiers' part for several days previous to the attack.

RESERVATIONS.

THE peace policy is my natural and chosen course of thought and action—yet, without intentional inconsistency, I have been found in the thickest of several engagements—many hand to hand encounters, the sanguinary character of which are attested by numerous scars and disfigurements, caused by bullet, blade, club, and knuckle; nevertheless I am always endeavoring to cultivate friendly relations with every living creature; and none of these conflicts have arisen from any aggressive thought or act of mine. True, in the wilds of Africa and Arizona, life has been taken, but only to save life, and when driven to the wall. So, in the crowded marts on both continents, have I taken the property of others, without an equivalent, simply in self-defense against the shafts of cold and hunger. It may be questioned, had I a right to commit these acts? Abstractly considered, they would be termed murderous and dishonest; yet, if I know anything of myself—and that has been a carefully studied science for thirty years—to take the life or property of the meanest living creature, has always been utterly abhorrent to me. The question must arise, Are we always responsible for such acts? Do not the pre-natal and subsequent conditions of existence seem to create and justify murder and robbery?

Man, like other anthropoids, lived naturally on fruits, nuts, and grains; and would never stray outside the zones which produce those articles in abundance, unless driven. But when on the war-path, and in partly desert regions where time and opportunity were not given for the production or gathering of the articles mentioned, animal food has been resorted to, until man has been gradually pushed to inhospitable regions, and the Arab, Tartar, Esquimaux, and Apache was the result. I confess to a strain of aboriginal blood, therefore may be accused of being not a disinterested party in this suit. However, there have been cases where the prisoners at the bar plead their own case. We choose, rather, to make our plea before taking a place at any bar or in any "reservation." In the abnormal conditions that surround us, and make us what we are, the natural laws of life are subverted, or become inoperative in a measure, therefore exact justice is impracticable, and we only plead for a modicum of consistency. Humanity might ask the removal of the straight-jacket from the poor maniac, yet a more discreet humanity demands its retention on the ground of safety to others. No books ever educated the hand or eye or imagination up to the production of such works as those of Michael Angelo, Canova, or Shakespeare, any more than they have to a knowledge sufficient for a fair judgment of others' acts. The truth in re-

gard to the just relations of man is not obtained by the student in his closet. Dickens said, "Only those learn to know who mix with all of nature's great creations." Judgment is rendered arbitrarily and tyrannically and without any but a theoretical knowledge of the case adjudged in many of the more important instances nowadays. This may presuppose the tribunals composed of persons who never committed an overt act and in most cases were never subject to the conditions making those acts necessary; therefore are one-sided and partial. To be faithful to justice and humanity involves a schooling which but few have the desire or opportunity of obtaining. The old Roman or Justinian law held the subject in the light of children to be cared for paternally by the Government, but modern civilization (?) chooses to suppose every individual acquainted with the law, and responsible for carrying it out, in letter and in spirit; yet in no age has there been such license. Indulgences are granted for the commital by those privileged of every crime under the sun. I here enter a solemn protest against the license and indulgence business. And the sentiment of the majority demand free trade, free thought, the disuse of penitentiaries, custom-houses, and privileges, and a remodeling of the language which calls one and the same act, when committed by different persons, by different names; justifying murder and robbery in one and punishing it in another. It is not claimed that we can get along, as yet, without "reservations;" in our present status, they may be necessary to restrain all, until our ethical strabismus is outgrown; but these "reservations" should not be chosen for their worthlessness and insalubrity, to decimate their occupants. A fair proportion of the breast of our bounteous mother-earth should be apportioned to each of her children. Each tribe kept on their own would eventually end their existence, or effectually cure the complaint; rendering them fit candidates for membership of society at large. In most cases it might be necessary to guard the "reservations" to prevent encroachments by the society tribes; in time all would see the wisdom of this purgatorial school, and accede harmony; but if each within their reservations choose to have tournaments, and by the skillful use of the lance should annihilate each the other, it would be their own loss. As a nomad I plead (and it is certain that I represent the large majority of the world's inhabitants) and beg in the name of justice and humanity for the apportionment. It is necessary, it is right; I want it for myself, and for all other tribes, which now have members scattered in every land endeavoring to hide or fraternize with those with whom they have no sympathy or consanguinity. There is one serious objection, in my mind, to this "reservation" business; and that is the necessity of resorting to the somewhat barbarous custom of tattooing or branding; which would be absolutely essential to the thorough carrying out of the system. Each tribe and subdivision of the larger tribes would require a distinct mark or brand, indelibly fixed. But this need not work a hardship, for by gradations the lowest could attain candidature for each successive tribal mark, which would be an unimpeachable diploma. This brand, together with General Crooke's policy, as applied to the poor insignificant Apache, would serve to keep each on their own "reservations," but nothing else would. This would prevent the Cheyennes, or Arrapahoes, or Crows from straggling into the agents', lawyers', or doctors' reservations, and *vice versa*. It has been said that truth was in the bottom of a well. I believe it. It is not only in the bottom of an unfathomable shaft, but the shaft has "caved" and the poor mangled remains of that idolized creature is buried in no end of rubbish. Who said that they were exhumed, found, brought to light? I would like to see the person and take him by the hand to know and feel if he were tangible, real flesh and blood. I think that some such conversation as the following might ensue: "I hear that you have found truth; is it so? Now let us consult together: You know, my dear man, that the world has been so often deceived by the semblance of truth that we are becoming more incredulous than formerly, and it may be necessary to devise a screen or test in order that all may

be satisfied that yours is the genuine article." (Long silence and deep thought). I suggest, "Weigh well your evidence, to see if some lurking sordid desire is not their father." The tribal division of mankind necessitates that other superfluity, "balance of power." Balance of power requires constant espionage and subdivision; these are all expensive. Suppose the energies that are now squandered in sustaining these castes and landmarks of society were expended in manufactures, arts, and sciences, is there a person living that has the pen or brain to picture or calculate the approximate result? No imaginary paradise has ever equaled the condition possible in which all would be partners if not equal. Equality is a myth. Nature knows no such term. A wise Omniscience arranges all things different. Let us agree to this fiat and differ harmoniously with "reservations."

F. M. S.

HISTORICAL SPELLING.

WELL we remember how we strained our young brains to understand why O-N-E should spell one. If we dared look up, "Please marm, what does E-Y-E spell?" The impatient answer was, "I, of course!" This always silenced further inquiry, though I must confess I never could see any "of course" about it, and burned to ask why? Now I never dared; but if I had, the reply would have been somewhat thus: "It is owing to the inestimable advantages and conveniences with reference to the relations of etymology that are secured by historical spelling." Happily for the teacher, this very syllogistical statement ends all discussions of the subject, for it would be rather difficult to point out any special advantage (or convenience either) in continuing to write the *ugh* of through.

To check the natural desire to find some adaptation of means to ends is the teacher's task, and is a hard one, but the scholar's is harder, to learn that *This is the right way, because it is.*

The English language is complete, and each of its words appears in a peculiar form that tells its derivation and history, and remains the same as a sort of anchor to hold the meaning during the petty vibrations and caprices of pronunciation to which a mature language is always subject. But the language spoken in America, though sprung from the English and bearing the same close resemblance to it that the child bears to the parent, is a growing language, the index of a progressive, youthful nation. And these vibrations around the written form of the mother-tongue, in it, become the germs of permanent changes, for it continually progresses forward and has no tendency to return again. A great part of our population are not of English extraction, and do not understand the principles of English, but they seize on the vigorous idioms that they hear, and cling to them. They are constantly cutting out the irregularities and arbitrary expressions used in England, so that we and the English are drifting slowly apart; and since that language is matured, but ours just beginning to grow, the rift between us must increase, and historical spelling, though very appropriate for them, a ceremonious, conservative nation, is inconsistent with the genius of our people and insufficient for our needs, chiefly because it furnishes no certain way to represent in all cases the sound of a word. This would not make, perhaps, so material a difference if our territory were as small as England, for there would be far less room for local dialects among the educated population. But ours is the widest country in the world which it is attempted to confine to a single dialect. Yet it is obviously necessary, from the peculiar form of our Government, that the language should be identical in every part. With local dialects arise party feelings and sectional differences, but where the language is the same, the people are united by stronger bonds of brotherhood.

> "Wherever sounds the German tongue
> And German hymns to God are sung,
> That is the German's fatherland."

It is a matter of history that States of different language never succeed in a friendly

union. Now, we do not imagine that our country can ever be divided up into languages; but when one letter has six sounds, as A in our alphabet, the wonder is that there are not a great many more provincialisms (the foundation of dialects) than there are among us. The Senate had to laugh, when the gentleman from Connecticut said, "A rolling 'stun' gets no moss;" and the effect of his eloquence was entirely spoiled. Yet the good people of Connecticut are not so much to blame for mistaking the sound of the O-N-E in stone, for the same letters spell un, in many words, as done, none, one, etc.

But besides its opposition to the progressive genius of our language and its being unsuitable for a vast population like ours, there are certain grave faults in Historical Spelling *per se* which would justify a practical people in tabooing it.

First: it is really "Historical Spelling," and embraces not only the history of the English language, but that of every nation which it ever came in contact with. And all this history and etymology in one small spelling-book render it irregular and promiscuous to an absurd degree. How much practical knowledge in science might be obtained with the same study and time that is required to master all the rules and the still more numerous exceptions of Historical Spelling! Words from the Latin, as a rule, are the most regularly spelled that we find in our dictionaries; but there is a list of German and Greek nouns which, though perfectly regular at home, when "anglicized" become choice subjects for spelling-matches. Among these are gneiss and schism, phthisic, etc. So numerous, indeed, are the lists of queer words that by the time all are mastered, the better part of a life is spent; and even then, if one meets the name of a new Western town, he does not know how to pronounce it, for he does not know whether the spelling is English, French, Indian, or what!

The only real objection to a phonetic revision of our spelling is the disturbance of etymological relations. We do not think that this would be great, but if it were, the time and pains wasted in long years of study to write and pronounce well, are more than can be recompensed by any convenience to etymologists. We are a practical people, and spelling might be such that even the youngest could soon understand it perfectly. Few are interested in etymology. The people are greatly concerned in easy and correct reading. Is it not better, then, that the few should consult an etymological dictionary, than that they should glean a little from the word's form, and every one else be forever perplexed with endless Historical Spelling?

A WONDERFUL LAKE.

AWHILE since, we met with a description of a lake in Central Florida, of which the following is the substance. It reads, indeed, like some of the stories in The Arabian Nights, but having the confirmation of scientific authority in the person of Prof. J. P. Steele, we do not hesitate to publish the account:

"'This lake rivals the famous valley of Sinbad the sailor. It is thought to average 2,000 feet down to the water, all round. The walls may be reported as entirely perpendicular, running down into the water and leaving no beach. The depth of the water is unknown, and its surface is smooth and unruffled, as it lies so far under the surface of the mountain that the air currents do not affect it. Its length is estimated at twelve miles and its breadth at ten. There is a beautiful island in its center, with luxuriant trees upon it. No living man has ever yet reached the water's edge, and it is not probable that any ever will. It lies silent, still, and mysterious, in the bosom of the 'everlasting hills,' like a huge well scooped out by the giant genii of the mountains in the unknown ages of long ago, and all around it, great primeval forests an eternal watch and ward are keeping.'

"In company with an experienced guide I reached the little lake in question at about the hour of ten in the morning. How large

it was I could not tell, but I judge it must be of considerable size, from the fact that I could not see across it, although enjoying a kind of bird's-eye view from a location some distance above the level of the water.

"Seeing nothing unusual about the place, I was on the point of expressing my disappointment to the guide, when he, having read my thoughts, cut all short by asking that I make a careful survey of the water, remarking, at the same time, that while there was really nothing extraordinary about the lake itself, it was strangely and wonderfully inhabited.

"I turned my attention to the water, and was soon convinced that I had, undoubtedly, met with a phenomenon, for it was so clear, so very transparent, that I could see through it in every direction with as much apparent ease as if it had been the atmosphere itself. Presently I saw one of the inhabitants hinted at, a little creature of a light brown color, looking, as it glided here and there, through the pure element, not unlike a common chimney swallow. Then came another, and another, and another, until all the waters of the lake seemed to be thickly swarming with them. They were very busy and very swift in their motions, darting, whirling, and angling with the greatest ease and the most charming grace; the guide said that like birds of the air, they were in quest of their prey, feeding upon animals too small to be seen by us from our stand-point.

"Suddenly, while I was gazing in wonder upon these strange creatures, a new actor appeared in the person of a larger animal, about the size, shape, and color of a huge muskmelon. He was quite transparent, so much so that I could see through and through him as plainly as if he had been a glass jar; and as he moved leisurely about, I noticed that he was catching and devouring the little 'swallows' without mercy. His interior, which seemed to be a huge cavity—nothing more—was literally filled with them, some still alive and swimming about in their strange prison. The entire mass held within his gigantic stomach kept up a rapid whirling round and round in one direction, from which I inferred that he had no regular digestive organs, but simply *wore* out his food; that is, reduced it by friction to a proper condition for his sustenance.

"Scarcely had I got fairly interested in this extraordinary animal when along came something which looked, with its slim, arching neck, very much like a swan. Its course was so directed that ere long it was brought into contact with the 'muskmelon,' and a fight was the consequence. It was a short fight, however, for neither of the parties seemed to relish the business, so they separated and struck off in opposite directions. A little distance, and the 'swan' met another of its own kind, and they commenced billing and cooing like two mated doves; but their pleasures were destined to be of short duration, for just at that instant a large and hideous-looking creature, with great horns and glaring eyes, pounced upon them from a covert hard by, seizing them both. A terrible struggle ensued, in the course of which one of the 'swans' made its escape, but the monster gripped the other fiercely by its slender neck until it ceased to struggle, after which he settled down with it to the bottom of the lake, and very quietly began converting it into a meal.

"About this time I noticed a second monster equally as frightful in appearance as the one just referred to, though evidently of a different species. He was moving along on the bottom of the lake, and unless his course were changed, would pass very near the other. The first monster's treatment of the 'swans' had made me his enemy, so I was well pleased with the turn affairs showed a prospect of taking; I desired that his banqueting should be disturbed. And it was. The new-comer found him, and went in for a share of the prey. A battle, the most frightful that I had ever before witnessed between two living creatures, immediately commenced. They seized each other and rolled over and over in a real death struggle, for several minutes, in the course of which they actually tore each other limb from limb. Finally one of them yielded up and died, after which the other with but two legs left out of six, dragged itself slowly away. And another installment

of animals, some like gigantic leeches, and others like Oriental turbans, and all effecting locomotion by stretching and pulling themselves into every conceivable shape, settled down and fell to regaling themselves upon the carcasses. They were, doubtless, the vultures of this remarkable body of water.

"Half a day or more was spent by me in watching the inhabitants of this Florida wonder. In the course of that time I saw very many strange sights—more than I could hint at in a short article like this. Besides, a written description could convey but a faint idea of the reality; one must see for himself before he can appreciate. Every reader of this *Journal* who has not already examined the remarkable body of water under consideration should do so without fail before he dies, for it will give him new ideas attainable from no other source. If he can not make it convenient to come all the way to Florida for that purpose, let him arrange to see the lake at home. A good microscope with a drop of impure or stagnant water upon the stage will enable him to have the same kind of lake at any locality he may select."

UNPARDONABLE IGNORANCE.

THERE is much ignorance in the world. Some of it is pardonable because it is unavoidable; but there is much of it that might be avoided, and that may properly be termed unpardonable ignorance. There are very few people who may not attain to a good general knowledge of those things which distinguish the intelligent man. We can not all be great, but we all may do our best; we can not all be learned, as scholars use that term, but we all may make the most of our opportunities. That ignorance which results from neglecting privileges, is certainly reprehensible; and the world, shame though it be, is full of just such ignorance.

What right has a man whose early education has not been wholly neglected, to remain ignorant of the country in which, and the Government under which, he lives, and yet to claim those rights and exercise those privileges which demand the highest intelligence? What right has a man voluntarily to remain in ignorance, and yet to force the evil effects of his ignorance upon the public? We are not among those who would establish a lettered aristocracy, or would ask the man who offers his vote, to give the inclination of the earth's axis to the ecliptic, the source of the Nile, and the center of the solar system. But we do think it a shame that men should be needlessly ignorant of those things on which, as voters, they are called upon to decide. We do claim that every man should know for what he votes, and why he thus votes. In a Government like ours, in which every man is a ruler, the intelligence of the masses is our only safeguard; and, though much boasting is indulged regarding our intelligence as a people, the writer fully believes that the greatest danger to American institutions lies in the blind ignorance of a large proportion of our voters. We need fear nothing from without; all danger lies within. And while we have more than a million of voters who know no more about the genius of our Government than a child of six years of age, we are by no means as secure as we fondly imagine ourselves to be. In ignorance there is always danger.

The privileges of the schools and the cheapness of books and periodicals, place general information within the reach of nearly every one; and they who neglect to profit by their opportunities, are unpardonably remiss in their duty both to themselves and to the country. Theirs is, indeed, *unpardonable ignorance.* E. T. BUSH.

HUMAN ORGANIZATION MULTIPLE.—Out of the letters of the alphabet words without end can be made. Now, a man has some thirty distinct and describable tendencies or faculties; and each has its own law; and the law of God has respect to every one of these; and what a vast complication they make! We can classify them and call them physical laws, social laws, moral laws, and spiritual laws; but we can not comprehend all the results which they are capable of producing in the higher realms of their

action. Above physical elements, which have to do with our relations to the material world, and the social elements which have to do with our relations to each other on earth, are others which are less apt to be understood. There is the reflective, which plays an important part in the reasoning process. There is the perceptive, which takes cognizance of the unseen. Then comes in imagination. After that comes in aspiration—that indefinite wanderer that goes seeking every whither, on every side, for rest, and finds it not. Every generous soul has this longing for something higher, something purer, something better. And here we break into the great invisible, spiritual realm, that is unexplored and unexplorable by the mortal eye; that is, and must forever be, unknown by the flesh, but that is to be known and inherited by the spirit. In all this mighty plexus of laws which run with the human faculties, connecting man by the body with the terraqueous globe, connecting him by the social elements with society and with business, connecting him by the intellect with the universe, and connecting him by faith and spirituality with the great populous world above, with angels and archangels, and with God himself, what vast creatures we are! How large a man is when you look at him in the light of all his possibilities and connections!—BEECHER.

THE WORK OF A HURRICANE.

THE village of Pensaukee, situated twenty-four miles north of the city of Green Bay, Wis., was entirely swept away by a whirlwind on the evening of July 7th. About half-past six o'clock in the evening a violent thunder-storm arose, which increased in fury, and at seven o'clock blew a perfect hurricane. The whirlwind came from a north-westerly direction, and is said to have resembled a dense cloud of fire and smoke, and moved at a terrific rate of speed. Huge trees were torn up by their roots and hurled a distance of twenty feet into the air. Some of the villagers ran from their houses and clasped their arms around the fence-posts, and in that way were saved. Houses were taken up, and the spot where they once stood left entirely bare, not even the foundations being left standing. The scene after the storm was sickening; cattle strewed the ground in all directions, many of them being dashed to pieces. F. B. Gardner's fine hotel was entirely destroyed. This building, which was built for the accommodation of fishing and hunting parties, was a handsome three-story and basement brick building, and is now a mere heap of ruins. Only one house escaped destruction, it being situated on the outskirts of the village. One saw-mill, one shingle-mill, and one grist-mill are entirely destroyed, the boiler of the grist-mill being thrown a distance of ten feet. Among the other buildings destroyed was the Company's store, in which was a large safe, and which was blown a distance of twenty feet, the Chicago and North-western Railroad depot, a school-house, and a large boarding-house. Two adults and four children were killed, and many seriously injured. One man and three children were blown into the river from a distance of about two hundred feet. A small tug-boat was blown clear out of the water and the fragments scattered to the winds.

The loss of property in the village will probably exceed fifty thousand dollars, and there are many farm-houses, barns, etc., north-west of Pensaukee destroyed. Many almost miraculous escapes are reported. The clerk in the store jumped through the window and lay down close to the building. The store was blown down and he was covered with the *débris* of the ruins, but escaped without a scratch. One young man was blown against the wall on the inside of the hotel; the wall fell out and he went with it; more than half the building was blown down in his vicinity, yet he escaped with a few scratches. W. H. H.

SLANDER.—Take half an ounce of Truth, add to it five ounces of Malice, five of Distrust, ten of Idle Talk, ten of Exaggeration, ten of Carelessness, fifteen of Love of Excitement, fifteen of Self-satisfaction, twenty-five of Indifference; stir *ad infinitum*, and you will have a fine SLANDER. This can be used in all seasons, and the atmosphere does not affect it.

Then there is always some basis?

Always, however slight—with only the necessary exceptions to prove the rule.

G. H. H

It is only by training all together—the physical, intellectual, and spiritual elements—that the complete man can be formed.

WHAT AND HOW SOME GREAT PEOPLE ATE.

IN a late number we cited the facts supplied by history with reference to the diseases which were the immediate causes of the death of many distinguished men. In the following article we have an array of interesting data which hygienists could apply, we think, with better effect than the writer, to the resolution of questions which have arisen concerning the causes of the maladies and infirmities of the memorable persons quoted.

"Mr. Buckle has traced the physical, moral, and intellectual degeneracy of the Hindoos to the element of starch in rice. If only their remote ancestors had lived on wheaten bread and good roast beef, instead of rice, the history of the world would have been changed, he thinks. Sir James Mackintosh used to say he believed the difference between one man and another was produced by the quantity of coffee he drank. Who, then, will deny that it is worth our while to ask what has generally been the food of great men? If, says Mr. Carlyle, heroism be sincerity, may we not all be heroes? If, say we, greatness is the result of good living, may we not all become great? Unfortunately it is extremely difficult to lay down any proposition on the subject with scientific accuracy. Facts there are in abundance: no attempt as yet at classification. We are in the experimental stage of a new science—for such it may claim to be, in these days, when it is sought to refer all spiritual effects to physical causes.

"'Great men are great eaters' would probably be the first exclamation of one who was given to over-hasty generalization. There would indeed be many examples to support such a rule. Charles V., for instance, was an enormous eater. We are told that 'he breakfasted at five on a fowl seethed in milk and dressed with sugar and spices. After this he went to sleep again. He dined at twelve, partaking always of twenty dishes. He supped twice; at first soon after vespers, and the second time at midnight or one o'clock, which meal was perhaps the most solid of the four. After meat he ate a great quantity of pastry and sweetmeats, and he irrigated every repast by vast drafts of beer and wine. His stomach, originally a wonderful one, succumbed after forty years of such labors.' (Motley, 'Rise of the Dutch Republic.')

"After all, Charles died at an age—about fifty-eight—at which we are accustomed in these days to consider a statesman as still in the prime of life. The love of pastry appears to have been hereditary in the House of Hapsburgh. Philip II., the same historian tells us, 'looked habitually on the ground when he conversed, was chary of speech, embarrassed, and even suffering in manner. This was ascribed partly to . . . . habitual pains in the stomach, occasioned by his inordinate fondness for pastry.' Philip ordering an *auto-da-fé* after a meal of gooseberry tart, which had disagreed with him, is a subject for an historical picture.

"Frederick the Great is another illustration of the rule. Though he could dine on a cup of chocolate in war time, he loved good eating and drinking, and undoubtedly hastened his death by refusing to conform in any way to proper rules of diet. 'The King,' wrote Mirabeau, who was in Berlin at the time, 'eats every day of ten or twelve dishes at dinner, each very highly seasoned; besides, at breakfast and supper, bread-and-

butter covered with salted tongue and pepper. We are at the last scene.' No wonder. A short time before, a gentleman dined with Frederick, when an eel-pie was brought to table which he declared was so hot 'that it looked as if it had been baked in hell.' The king was immoderately fond of these eel-pies, peppered to excess. But about six weeks before his death we have the record of a breakfast such as a sick man has rarely eaten. Our authority is again Mirabeau. 'On the 4th of July, when the doctor,' the celebrated Zimmerman from Hanover, 'saw the king in the afternoon all had again changed for the worst. He had applied himself to public business from half-past three in the morning till seven. He then ate for his breakfast a plate of sweetmeats, composed of sugar, white of eggs, and sour cream; then strawberries, cherries, and cold meat.' Frederick's illness was dropsy. He died on the 17th of August, 1786. Every schoolboy will remember the parallel of the English king who died of eating too many lampreys. King John, too, is said to have died of a surfeit of peaches and new ale. The verdict of modern epicures will probably be, 'Served him right.'

"Most of the English kings, we suspect, were fair trencher-men, as most of them were also men of ability. There is a curious anecdote of Henry VII. bearing on this subject. The king had been out hunting in the neighborhood of Windsor. His eagerness in the pursuit of the chase had carried him out of sight and hearing of his retinue. Night was falling; return to the castle that day was inexpedient, for close at hand lay the Abbey of Reading. Thither, accordingly, the king turned his steps. His habit was simple, and the good monks took him for one of the royal foresters, while Henry, for reasons of his own, did not care to undeceive them. He was hospitably entertained, and the lord abbot looked on with an approving smile at the hearty performance of his guest. At last he said, 'Truly I would give his grace your master the half of my revenues for so good an appetite.' Three days passed; the abbot was suddenly arrested in the king's name and hurried to the Tower, where a diet of bread and water was assigned him. The end of the story may be imagined. Before a month was over the abbot had recovered an excellent appetite for more substantials. But the tale is obviously apocryphal. Even a Tudor could not have arrested a mitered abbot in this summary fashion.

"Descending to the Stuarts, we find Henrietta Maria, at her first banquet in England, eating pheasant on a Friday, notwithstanding the signs and even open remonstrances of her French confessor. Poor girl! she was scarcely seventeen, and the sea passage had probably given her an appetite.

"Her estimable son, King Charles II. of glorious memory, delighted in eggs and ambergris, of which we may hope he partook moderately. His death was supposed by some to have been occasioned by poison administered in this his favorite dish.

"William III. both ate and drank more than was good for him. He loved to sit many hours at table: indeed, dinner was his chief recreation. Nothing must interfere with his enjoyment; the Princess Anne might look wistfully at that dish of young peas, but she looked in vain, for the king ate them all, and never offered her a spoonful. She revenged herself by calling the deliverer 'Caliban.'

"Among other sovereigns we find the great Napoleon a voracious eater. Some one has attributed the loss of the battle of Leipzig to the effects of a shoulder of mutton stuffed with onions, with which the emperor literally gorged himself, so as to become incapable of clear-minded and vigorous action. He ate very fast. The State banquet at the Tuileries lasted about thirty-five minutes. On the other hand, he was no lover of wine. In that melancholy voyage to St. Helena, he offended the English officers by rising from table before drinking had fairly begun. 'The general,' one of these prigs had the brutality to say in his hearing, 'has evidently not studied manners in the school of Lord Chesterfield.' Their idea of politeness—certainly not Lord Chesterfield's—was to drink on until you dropped under the table.

"The founder of the greatness of Russia

must unquestionably be added to the list of great men and great eaters. Macaulay tells us how, when Peter the Great visited England in the year 1698, the immense quantities of meat which he devoured, the brandy which he swallowed, and which, it was said, he had carefully distilled with his own hands, were during some weeks popular topics of conversation. Great as was Peter, he might have found his peer in the Roman Emperor Maximin (A.D. 235–238), who could eat in one day forty pounds of meat and drink six gallons of wine—unless the historians lie.

"There can be no doubt, however, that the Roman emperors numbered among them many a notable glutton. Heliogabalus loved to sup on the tongues of peacocks and nightingales; he fed his lions on pheasants and parrots. His Majesty would also give a zest to the pleasures of the table by assembling companies of guests who were all fat or all lean, or all tall or all short, or all bald or all gouty. Capital fun, too—for the Emperor. The truth of the story that Nero enriched his soups by dissolving diamonds in them may safely be left to chemists to decide.

"Of the first, the true Cæsar, of him who has been called the greatest character in history, it may be sufficient to quote the famous saying of Cato, 'That of all those who had helped to . . . . overthrow the republic, Cæsar was the only sober man.' It is not the less true that he loved the pleasures of the table, and was an affable and genial host. As a guest he probably gave the finest example of high breeding that has ever been known. The story is familiar as told by Suetonius. The dictator was dining out. Some rancid oil was served with the salad. Every one else made wry faces. Cæsar appeared not to perceive the mistake and asked for another supply.

"Heyne, while editing his 'Tibullus' in Dresden in a poor comrade's garret, with the floor for his bed and two folios for a pillow, gathered peasecod shells in the streets and boiled them for his dinner.

"When the Emperor Julian was first elevated to the rank of Cæsar, the young philosopher was quite distressed at the imperial *menu*—so elegant and sumptuous was the bill of fare. Pheasants he positively forbade to be brought to table, and extended the same prohibition to sow's udder (probably boiled in milk), a famous Roman delicacy. Whether this last order was purely a heroic instance of self-denial may be doubted.

"Mahomet, though the founder of a sensual religion, which promises a sensual paradise, was himself an abstemious man. 'Disdaining,' says Gibbon, 'the penance and merit of a hermit, he observed, without effort or vanity, the abstemious diet of an Arab and a soldier. On solemn occasions he feasted his companions with rustic and hospitable plenty; but in his domestic life many weeks would elapse without a fire being kindled on the hearth of the prophet. The interdiction of wine was confirmed by his example; his hunger was appeased with a sparing allowance of barley-bread; he delighted in the taste of milk and honey; but his ordinary food consisted of dates and water.'

"The old proverb said, 'Tell me what you drink, and I will tell you what you are.' Brillat Savrin varied it to 'Tell me what you eat, and I will tell you what you are.' Neither is a good criterion. Temperament, nationality, climate, produce a thousand individualities. It is said that an Englishman fights best when full, a Frenchman fasting, and a Dutchman drunk; a Prussian, we might add, with a pipe of 'requisitioned' tobacco in his mouth. Herodotus tells us of a wise custom among the Persians: when a question of State was to be debated they got drunk and gave their opinions under the encouraging influence of the wine; next morning they considered the subject when sober, and then compared their judgments. Herodotus would probably have ascribed the imposition of the match-tax and the withdrawal of the tax to two different Cabinet councils—one after dinner and one after breakfast. The same of the prohibition to hold a meeting in Trafalgar Square and the withdrawal of that prohibition.

"An extract from Boswell's 'Life of Johnson' is not to be resisted in a paper on the 'Food of Great Men.' 'When at

table he was totally absorbed in the business of the moment; his looks seemed riveted to his plate; nor would he, unless when in very high company, say one word, or even pay the least attention to what was said by others, till he had satisfied his appetite; which was so fierce and indulged with such intenseness that while in the act of eating the veins of his forehead swelled, and generally a strong perspiration was visible. To those whose sensations were delicate this could not but be disgusting; and it was doubtless not very suitable to the character of a philosopher, who should be distinguished by self-command. But it must be owned that Johnson, though he could be rigidly abstemious, was not a temperate man either in eating or drinking. He could refrain, but he could not use moderately. He told me that he had fasted two days without inconvenience, and that he had never been hungry but once. They who beheld with wonder how much he ate upon all occasions, when his dinner was to his taste, could not easily conceive what he must have meant by hunger; and not only was he remarkable for the extraordinary quantity which he ate, but he was, or affected to be, a man of very nice discernment in the science of cookery. He used to descant critically on the dishes which had been at table where he had dined or supped, and to recollect very minutely what he had liked. When invited to dine, even with an intimate friend, he was not pleased if something better than a plain dinner was not prepared for him. I have heard him say on such an occasion, "This was a good dinner enough, to be sure; but it was not a dinner to ask a man to." On the other hand, he was wont to express with great glee his satisfaction when he had been entertained quite to his mind. One day, when he had dined with his neighbor and landlord in Bolt Court, Mr. Allen, the printer, whose old housekeeper had studied his taste in everything, he pronounced this eulogy: "Sir, we could not have had a better dinner had there been a *synod of cooks*."

"'In the matter of drink he frankly confessed that his liking was for the strongest, as it was not the flavor, but the effect that he desired. He loved to pour capillaire into his wine, and melted butter into his chocolate. [What wonder that he was dropsical, wheezy, short-breathed, etc.] Voltaire's taste, by the way, was curious in this respect, for he mixed coffee and chocolate together. One remark of Johnson's seems to hit the bull's-eye. "Wherever," he said, "the dinner is ill got up, there is poverty, or there is avarice, or there is stupidity; in short, the family is somehow grossly wrong, for a man seldom thinks with more earnestness of anything than he does of his dinner, and if he can not get that well dressed he should be suspected of inaccuracy in other things."'"

W. G. MURRAY.

ANIMAL HEAT.

FROM the classical investigations and experiments of the distinguished physiologist, Claude Bernard, on Animal heat, its regulation and influence on fever, published in the *Giornale Internazionale*, 1877, No. 1, are extracted the following conclusions:

By means of thermo-electric sounds it is proven that venous blood is warmer than arterial, and the blood of the vena cava inferior in consequence of thermal sources in the liver, and hepatic vein is warmer than that of the vena cava superior. Since the superior vena cava with its branches is outside of the abdominal cavity, it resembles the superficial peripheric veins in containing cooler blood, and therefore it is that the blood emptied from it into the heart is cooler than the blood emptied from the heart into the carotid arteries. The right auricle also receives cooler blood from the lower part of the body. But after the cooler and warmer venous blood have become mixed, the blood in the right ventricle is still warmer than that in the left.

As regards the influence of the nervous system, the author distinguishes between dilating and contracting nerves (*nervi dila-*

torii et constrictorii), *i. e.*, such as effect dilatation or contraction of the blood-vessels. The first set he is inclined to call *trophic* nerves, as he has shown that by section of the trigeminus, paralysis of these nerves ensues and disturbances of nutrition.

Nutrition and animal heat are effected solely by the influence of nerves upon the circulation of the blood. Two kinds of vaso-motor nerves, therefore, must be recognized: *nervi medullares vaso-dilatorii* or *caloriferi*, which effect oxidation of the tissues, denutrition, a metamorphosis of anatomical elements; 2d, the *nervi vaso-motorii constrictorii*, which effect nutrition and organization of new tissue. These are also the *nervi frigorifici*, which lower the temperature and hold a balance against continuous oxidation. Wherever, then, new tissue is formed, the *nervi frigorifici* are engaged. Therefore it is that wounds cicatrize quicker under cold-water irrigation, and in animals in hibernation, than in summer, or in the state of activity.

In fever, on the other hand, there is greater activity of the *nervi caloriferi*, in consequence of which there is continuous oxidation of tissue, denutrition, and emaciation. Exact physiological experimentation thus confirms clinical experience. It is the great heat that constitutes the danger to life in fever; the oxidation of tissue, the reduced nutrition, that leads, unchecked, to death.

The therapeutic indication is to check the extraordinary activity of the calorific nerves by stimulation of the nerve-centers presiding over the constricting or frigorific nerves. Hence the efficacy of cold baths. Whether quinia, ergotin, and salicylic acid act in the same way, remains to be proven by further experimentation.—*Cin. Lancet and Observer.*

CONSECRATED LIFE.

THERE are wants peculiar to certain times in the history of the world. The need, it seems to me, of the present time for the glory of God and the progress of pure and undefiled religion is *consecrated life*. The times do not lack men of recognized and acknowledged ability, men of liberal education, men who can guide ships, run engines, control large manufactories, men who can command armies and govern nations, but it does lack men, and women too, who can and do *govern themselves*.

We forget that "he that ruleth his spirit is greater than he that taketh a city." It is, no doubt, easier sometimes under the spur of abnormal ambition, love of conquest, and desire of gain, to "take a city" than to control these unlawful desires and practice the unselfish precepts of the Gospel of Jesus by "doing unto others as we would that they should do unto us."

Many perish, perhaps, for lack of knowledge, more are lost because they do not *live* the truth as they know it.

THE IRREPRESSIBLE CONFLICT.

Just here comes in the great conflict between man's carnal nature, with all its natural and acquired wants and appetites, and God's will as manifested in the constitution of his being. This is what that most profound philosopher, Paul, called "minding the flesh." With equal physiological, moral, and religious truth, he says that the minding of the flesh is death. If *unrestrained*, it sooner or later leads to the destruction of the body and the mental and moral powers. God in His great scheme of benevolence, in which He brings life and immortality to light, placed before man not only bodily health and length of life and happiness in this world, but moral purity and excellence here, and eternal life and happiness in the future world, as motives to induce him to consecrate himself wholly to the service of high, noble, unselfish purposes.

IMPORTANCE OF THE BODY.

Our bodies may become habitations for the Spirit. Shall we, by improper indulgence of appetite and passion, by unhallowed desires so debase, defile, and blunt our perception of truth and right, prostrate our spiritual faculties as to shut up the avenues by which God's Spirit ordinarily enters within "this tabernacle?" No man can pre-

sent his body as a living sacrifice, acceptable to God, while indulging in habits that are destructive to the physical, mental, or moral powers. We can not deny that many of the excellent ones of the earth have learned, through physical sufferings, the lesson of obedience. But we believe that he who can, by obedience to the laws of health, not living after the flesh, but after the spirit, enjoy vigorous health, devoting it to noble purposes, *best* serves humanity and glorifies God. It may be easy under the influence of the sentiment, "Let us eat and drink for to-morrow we die," to barter the possibility of high attainments in the present life, and a glorious inheritance in the future, for a mess of earth's pottage.

PERFECTION OF CHARACTER.

This embraces more than simple desire to be "saved;" it requires daily, hourly, and persistent endeavor. The low places of self must be lifted up. The sharp corners must be broken off, and the rough places made smooth. Man is not left to struggle for this high attainment against great opposing forces unaided. He that truly turns his face upward, seeking to *know* his duty as God reveals it, seeking to *do* his duty as God commands, will find his path like that of the just, "shining more and more unto the perfect day." The day which by its clear light will reveal unto him still more of truth, more of duty, more of divine love and guidance, "Then shall ye know if ye follow on to know the Lord." Where finite wisdom ends, infinite wisdom may begin. Where *finite* capacity reaches its utmost limits, infinite power may come to give success.

Man's hour of extremity, when in his weakness he breathes the prayer of faith, is ever God's time to reveal Himself most lovingly and helpfully, the time when out of weakness he is made strong.

FEAR OF FAILURE.

Many persons are deterred from entering upon a course of life calculated to develop their latent powers and call into activity their highest faculties by the fear of *failure*. They say, "We would prefer to remain in comparative obscurity, assuming no obligations, making no professions, rather than fail to reach a high position." This is wrong. Such persons are exercising a certain kind of pride, or else they lack *true courage*. You should press forward though you may not attain to the highest position in life's honorable and useful pursuits or professions. Every one shall be held responsible for his one, two, or three talents. You dare not say because I have but *one* talent I may bury it in the earth. You may not lawfully hide God's money; no, you must put it on exchange. You must study your qualifications and the world's needs, and seek to render the highest service within your power. You have an ideal life higher, purer, and nobler than your actual life; strive to live it.

Be true to truth in all personal relations to it. One of the grandest ways in which to testify to the truth is to *endure* patiently, adhere to right. In some men's hearts are works where falsehoods are hid away, and because of this they are unsuccessful. Each one holds truths peculiar to himself. No truth, perhaps, is known by any one but which, sooner or later, he will be called to utter and maintain. Truth is not revealed or acquired to lie dormant. God will manufacture providences for you if you are faithful, but you may not expect such divine assistance if you are a coward. He whose life is hid in the bosom of God shall never fail.

G. C. MC ELROY, M.D.

TEA AS A SURGICAL ADJUVANT.– In the course of a lecture on contused and lacerated wounds, given by the late Prof. Crosby, of Bellevue Hospital, New York, he made the following pertinent remarks with regard to the use of stimulants in medical and surgical practice. In the treatment of a patient who had lately sustained very severe injuries to the head, he had employed strong tea as a substitute for alcohol: "I may say that the use of strong tea was forced on my notice by the patient, who refused to take any form of alcohol. He was suffering from shock induced by an amputation performed between the middle and lower third of the thigh. This amputation was secondary to a gun-shot wound, and was what the French call *mediate*. The shock was ab-

solutely terrific; the pulse remaining whole and pulseless for several hours. Failing to quiet his conscience in regard to the use of the alcohol, I gave him strong tea freely, and was gratified to find that he did well with it, reaction soon taking place. I may also add that in women, after delivery, it forms a satisfactory substitute for alcohol, and one which will bear a more extended use."

In regard to this use of tea we have only to say, that we are very willing to accept Dr. Crosby's authority, and believe that the general disuse of alcohol in its favor would be productive of great benefit in all cases where some stimulant is deemed necessary for the prompt recovery of a person from great nervous and blood depression.

OUR NATIONAL DISH--PIE.

The Prevalence of Pie—The Charm of Pie—Is Fat Digestible?—Fat as a Relish; as an Aid to Digestion—New Dishes — English Plum-pudding — Yorkshire Pudding—The Nature of Animal Fat—Fat is Dead Matter.

HEAR what an Englishman says of it: "Pie is one of the most established of American institutions. Indeed, the saying goes that 'all Americans die of pie.' It is nearly as venerated and probably more dangerous than our own roast beef and pudding, the one inseparably associated in the popular mind with Thanksgiving as the other is with Christmas Day." We have made this quotation not for its aptness nor its elegance, but to get a glimpse of ourselves as others see us. Now we will endeavor to dissect our own pie, and before we finish, perchance we may put a lancet into our neighbor's pudding.

Everybody who thinks at all on the subject, seems to take it for granted that pie is unwholesome. Doubtless many speak from experience, certainly many have opportunity to do so.

THE PREVALENCE OF PIE.

All through New England and in some of the Middle and Western States pie is the standard dessert at dinner. There may be pudding or there may not, but pie there must be, and usually two or three kinds of it, where there is any variety at dessert. At some hotels, and in some private houses in New England and in Northern New York, we have occasionally seen pie for breakfast, and it is sometimes put upon private tables for supper, though we believe this is never considered stylish. Formerly it was quite customary, but it has gradually been replaced by cake. There is no question but that Americans like pie, and as we have observed the preferences of foreigners at our own tables, we may add that we are much more partial to it than foreigners. But why should we like it? What is

THE CHARM OF PIE?

Pie, as we understand it, usually means some kind of fruit seasoned and baked in paste spread out uponp lates. We also have meat pies of various kinds, but these are not what we understand by the generic term "pie." The peculiarity which recommends it to our taste is the combination of the fruit with the cereal, seasoning the latter with its agreeable juices and flavors. The fruit is certainly *the* great attraction. People seldom complain that there is too much fruit, though they do sometimes complain of the thickness of the crust. But why not take the cooked and seasoned fruit by itself? This we do sometimes, or rather we eat it with bread and butter, but when they are cooked together, there is formed a delicious sauce between them which we do not otherwise obtain, and pie is the shape in which we have learned to like it best. Something like it we get in fruit puddings and dumplings, and hence their charm; but they must be eaten hot, while pies can be eaten cold and be kept for days, or even for weeks.

The cooking of meats or fruits in paste is not a new device. Ancient Grecian and Roman cookery produced many kinds of pies. The Emperor Verus devised a pie, but it was filled with bacon and peacock, ham, pheasant, and wild boar's flesh, which could easily be vulgarized into pork pie. Some of their tarts were made of chestnuts, herbs, rose leaves, quinces, gourds, radishes,

cherries, elderberry flowers, and rice, and we have but to mention this variety to show that their cheesy tarts, whatever they might be, were not like ours, or they never more would think of making them of radishes or elderberry flowers. Their pastry was usually seasoned with cheese and honey, and their recipes much more frequently mention pepper and salt and rice than fruit. The general use of fruit in pastry seems to be of a much more recent date, and we are disposed to look upon it as one of the steps of progress in the preparation of food. We know this is not the prevalent opinion. Fruit cake and fruit puddings and dumplings and fruit pies are considered the most indigestible of all things; but why? Are they worse than meat pies or dumplings or the same puddings without the fruit? The fruit is good, but the flavor is usually peculiar, and in case of disturbance this flavor is sure to be recognized and its cause blamed. But certainly there is blame somewhere, and what is the cause of it? Not the cereal, it does not produce the same effect in bread; not the fruit, which can be eaten safely enough with bread and butter. What, then? There is one other constant ingredient, and that is the

"SHORTENING."

Now, if you but stop to think, you will find that nearly all the articles complained of are mixed more or less with lard or butter or "drippings," with some kind of greasy or oily substance which is cooked into it. This constitutes the shortening, and this does the mischief.

"Well, but," one objector will say, "I use only butter, and the best at that." Still, butter is grease. You recognize that a large proportion of it makes "very rich cake," which must be eaten sparingly, if at all. You know that your loaf of bread-cake or your plain pastry for the children has very little shortening, and this is your unconscious acknowledgment of its unwholesomeness. You may make your own butter and your own lard, or even work up your biscuits with cream or with olive oil, and not have them wholesome after all. So it is not in the animality of the thing, nor is it in the mere fact of its presence. Instead of working it into the dough and baking the fruit in it, you may spread the butter upon your bread and eat your seasoned fruit with it, and you will find the diet much less injurious.

Here you have exactly the same ingredients, but treated differently, and in that difference of treatment lies most of the difficulty. Let us examine the progress of fat through the alimentary canal.

IS FAT DIGESTIBLE?

The gastric juice seems to have no power over fat to change its character. This was Dr. Beaumont's conclusion after many observations of it in the stomach of St. Martin, and after repeated experiments with fat and gastric juice in vials. As to what really is done with it, physiologists differ. Some say that the bile is called in to dissolve it, after which it is reduced to chyme by the gastric juice. Others say that it is dissolved by the bile after leaving the stomach, when, of course, the gastric juice would have but little further influence over it. Most of them agree, however, in saying that it passes into the blood as fat, in extremely small particles, in an emulsion, but still as fat. As this is an important point, we will make quotations. Dr. Pereira says: "The first change which the animal fat suffers when swallowed, consists in its conversion into liquid oil by the warmth of the stomach. Very gradually this oil is converted into a creamy-looking chyme, containing myriads of oily globules, visible to the eye when aided by the microscope, so that the oil is, in fact, not in solution, but, like the butter in milk or the oil in an emulsion, is held in suspension merely." In this state it "becomes absorbed by the chyliferous vessels."—*Food and Diet.*

Letheby says: "Fatty matters are digested by the emulsifying action of the pancreatic fluid; and by thus being broken up into extremely minute globules, they are freely admitted into the lacteal vessels; in fact, the emulsified globules of fat are seen covering the villi of the intestines, penetrating their tissues and thus entering the lacteals." We see no *digestion* about this: it is fat still.

Brinton takes it for granted that some of it is digested; he does not explain how, but he makes a most important admission with

regard to the remainder. He says: "Only a small quantity of fatty matter can really be digested at a time, any excess over this amount in the food being merely expelled from the intestinal canal with the fæces."

Reasoning from the analogy afforded by the digestion of well-known foods, we should say, that if it were a food and could benefit the system as such, it must be actually changed into chyme. If it is still oil, not materially changed by the digestive fluids, as most if not all physiologists now allow, we fail to see how it can nourish the living system. Now let us see whether it does so. It will be observed that cats, rats, and mice, although they may stick their teeth into butter, lard, and suet, seldom eat much of them. Dogs and other animals upon which experiments have been tried, eat of them at first and then refuse them. In 1841 the Gelatine Commission of the French Academy of Sciences stated in a report to that body, that animals fed on fatty substance (fresh butter, lard, and the fat which surrounds the bullock's heart) refuse after some time to take this food, and ultimately die of inanition. During life they exhaled a strong fatty odor, and though dying of inanition, were in a remarkable state of *embonpoint*. On a post-mortem examination, all the tissues and organs were found infiltrated with fat."—*Pereira on Food and Diet.*

It is useless to argue that it must be nutritious or needed by the human system because man eats it so freely. We have learned that man makes use of upward of thirty kinds of poisons in different parts of the world in the gratification of his whims or desires. If we believed, as some do, that our instincts have led us to combine those substances whose ultimate elements are just what we need, we should not think it worth while to write much on the subject. But what shall we think of physiologists who write books to show that men have naturally drifted into the best possible habits of eating and drinking, while, as a race, the half of us are walking into our graves before we are five years old? And yet we can hardly find a physiology that does not justify the use of a great many hurtful things in this way. One such writer very elaborately and even pathetically affirms that fat is necessary to prevent children from a tendency to consumption. It seems he has not so much confidence in the correctness of their inclinations as those of their elders. He intimates that the leanness of growing children arises from their being allowed to object to the eating of fat. He says: "There is a perfect craze amidst children upon this head; to whatever due, it is most foolish and deleterious. The rule among children is to object to fat, and how the little rebels ever came to so unanimous a conclusion as now exists, it is difficult to say. It is painful to see children at table permitted to reject every particle of fat, and then too commonly, in time, compelled to take cod-liver oil, the fears of their parents restoring to them that firmness they should never have laid aside. Still more painful is it to know that the absurd caprice, if persisted in, will in all probability lead to such a condition as may result in tubercle." And much more of the same sort.

We have made these quotations to show that we are perfectly well aware that "the doctors" are against us. Almost without exception, the old school doctors insist on the necessity of eating fat. And this in spite of their utter failure to prove it nutritious, and their own showing that animals can not live on it. But they have a way of getting around this, as they do some other things, by saying that though it may not be food itself, it gives a relish and aids the digestion of other food.

FAT AS A RELISH.

As to the relish, that depends on the taste. Children, as we have seen, relish their food better without it than with it. We are inclined to consider it a coarse taste which likes everything swimming in fat. There are large sections of country where this is not the case, and we have partaken of many delicate and delicious dishes which do not contain the ingredient. Our purest natural foods, the fruits, do not usually contain it, while our grains and our nuts, which have oils of their own, have them in forms so different from animal oils that their similarity is hardly recognized by the taste.

AS AN AID TO DIGESTION

the matter is well worthy of attention, for in this lies one of its greatest objections. We have seen that the gastric juice seems to have no power over the fat itself. Now if this is the case with fat, which floats free in the stomach, surrounded by the gastric fluid, much more would it be so with fat which is coated over or cooked into other substances, as in the case of shortened and fried articles of food. Still further, if the gastric juice can not dissolve this fat, how is it to gain access to the food associated with it in order to digest that? This is no merely theoretical difficulty. It is one that lies at the root of a large proportion of the indigestion and dyspepsia that afflict our "good livers." The difficulty is plain, and the dividing line is well-defined, and yet the physiologists have most of them hitherto failed to see it. Pereira does enumerate many shortened, fried, and greasy dishes as unsuited for dyspeptics, but he fails to point out how this cooking of fat into cereal and fibrous matters makes them difficult of digestion. He alleges that the difficulty is caused by some supposed chemical change to which cooking gives rise in the fat itself. We have seen that the very same ingredients which we eat with comparative safety in bread and butter and sweetened fruit sauce, when cooked together in a pie are far more difficult of digestion. Now if drippings (a kind of fat falling from roast meat, and which has attained the position of a distinct mention in English cookery) or lard or oleomargarine be substituted for butter, they prove nearly if not quite as digestible, although the drippings and the lard have been cooked, and the oleomargarine has been "processed" beyond our knowledge. The difficulty is simple, and lies in the hinderance made to the entrance of the gastric juice by the fat into substances which it has coated over and permeated. Let our cooks once understand this principle and they will find it a very great help in the preparation of wholesome food. They will see why puff paste, whether made into pies, puddings, dumplings or tarts, must necessarily be hurtful. They will see why melted butter is more obnoxious than the unmelted, because it becomes more intimately associated with the food to which it prevents the free access of the gastric juice. They will not only see why fried potatoes are so very indigestible when allowed to soak up much fat, but why in any case there is quite too much fried surface to be really wholesome. They will see why they should not drop a speck of butter into each gem tin, why, indeed, they should keep their gem pans in such condition that they scarce need oiling at all; and why oilstone griddles are so desirable, if they are going to use griddle-cakes at all. They will see why cake is hurtful, almost without exception. And if they will consider that the yolk of an egg has a large ingredient of oil (and that the hard-cooked white is quite as indigestible for another reason), they will see why they should not use eggs instead of shortening, or incorporate them with their long-cooked dishes at all. And if they will take into consideration that in all the features hitherto considered, vegetable oils are nearly if not quite as objectionable as animal oils, they will not try to find substitutes in that direction, as our English friends are doing. There may be reasons (which we will consider soon) why the vegetable oils are less objectionable than the animal, but we have yet to find any kind of oil with which fibrous or cereal matters can be shortened or in which they can be fried without interfering with their digestibility.

Yes, we know this makes a pretty clean sweep of the baker's counter, and, I am sorry to say, of a large share of the dishes on most private and public tables. But if our readers for the last five years or more have followed our numerous recipes, they are not at a loss for dishes entirely free from shortening in any shape. Moreover, if it will make an equally clean sweep of the dyspepsias, many an unhappy man will (perhaps) be willing to forego his customary toothsome dose of misery.

NEW DISHES.

We would specially advise the cooks to be brave, and strike out for entirely new dishes, rather than to reduce gradually the shortening in the accustomed dishes. That will only spoil their taste and cause discontent. Better put them away entirely, one

by one (if not all at once), and forget them, while you bring on something entirely different to take their place. Use, for example, fruit and cereal puddings, instead of pies. These combine the elements first mentioned, as the charm of the pie, without its hurtful ingredient, the shortened paste. It is true that a vitiated taste will crave the missing fat at first, but doing away with it will bring a much keener and more delicate taste and a better appetite, and the food will be enjoyed without the fat more than it ever was with it.

But it is not best to make too many changes at once, unless the case be desperate, and such cases we do not treat here. They require special medical prescription. We deal in these columns, or intend to, mostly with the common family diet, and we wish to make it conducive to the best interests of the family. So in putting aside shortened food, it may not be advisable to put away butter also at first. If eaten cold upon bread, it does not interfere with digestion as when cooked into the food. It is true we have very little to say in its favor. If it is not digested, it can not be nutritious, and we have innumerable cases where it causes such impurity as shows itself in pimples and blotches, if nothing more.

In the varied and interesting aspects of the case, we have come near forgetting our neighbor's

ENGLISH PLUM-PUDDING.

We are ready now to look it fairly in the face. It is shortened invariably with suet, which has the advantage simply of not sending its oil into all the surrounding cereal until the latter has been somewhat swelled and cooked with heat. Therefore it is not so hard and heavy as it would be if shortened with a more oily substance. Of course, then, the gastric juice does not have quite so much difficulty in penetrating its substance. But any boiled dough is almost invariably tougher and more difficult of division than that which is baked. There is nothing worse, we believe, except frying. English plum-puddings are proverbially indigestible, and we suspect the only reason why they are not even more complained of than American pie, is that the English are a little more deliberate in their mastication than the Americans. If plum-pudding were common here, doubtless we should die of it more extensively than we do of pie. Juvenile English literature is full of the wails that arise from "too much plum-pudding," which implies insufficient mastication.

The English have dishes that are worse than pie or plum-pudding, and some that are great favorites too. Among these the

YORKSHIRE PUDDING

stands pre-eminent. We should not call it a pudding at all. It is made with eggs and milk and flour into a stiff batter, sometimes baked in the oven for a while and then set down under the roasted meat to become saturated with the dripping. It is then served with the meat, and sometimes even placed under it on the platter. This is as bad as fried doughnuts saturated with grease. We can hardly imagine anything worse which is considered digestible at all.

There is much more that could be said, and which we would like to say on this whole subject, but will make only a point or two more, and leave it for the thought and reflection of our readers, for with all we might say they will not master it until they have thought and discussed and read about it for themselves.

The physiologists who insist that fat is so necessary for us, do not seem to consistently allow for the fact that the best fat-forming substances are purely vegetable. The fat hog and ox and goose do not obtain their fat from animal food. The carnivora that eat more fat are much more lean. Still less do they consider

THE NATURE OF ANIMAL FAT.

They take it for granted that it is food when they can not prove that it is digested or can nourish and keep in life the animal system, and in face of the fact that in experiment it does not. They *say* it is used as food in the absence of fresh supplies, but experience shows that a lean man will endure starving better than a fat man.

FAT IS DEAD MATTER.

Liebig says: "The abnormal condition which causes the deposit of fat in the animal body, depends on a disproportion be-

tween the quantity of carbon in the food and that of oxygen absorbed by the skin and lungs." And again: "The production of fat is always a consequence of a deficient supply of oxygen." So when animals are fed with cereals, which contain much carbon, and are restrained from exercise, by which they take in much oxygen, they are not able to dispose of the carbon. It falls lifeless and must be tucked away in the most convenient place, or else it will so befoul the blood as to cause congestion and immediate disease. The cellular tissue proves to be this convenient place, where it remains well tolerated until the animal has a chance by exercise or starvation to throw it off. But if the quantity be increased beyond what can be thus disposed of, it interferes with vital processes to such a degree as frequently to cause disease and death. Many fattened animals are almost ready to die with disease, as their livers show, and human beings thus troubled die of dropsy, apoplexy, and fatty degeneration of the vitals.

Another proof that fat is dead matter is found in the curious fact, that under some conditions of decay, muscle and other animal tissue changes into fat. Brinton thus learnedly puts it: "Formed within the sarcolemma by the regressive metamorphosis of the muscular substance, or sarcode." Instances of this we see in paralytic limbs half dead, where the impression of the finger produces a white spot which very slowly regains its natural color. Post-mortem dissection shows that these muscles have been undergoing more or less this regressive metamorphosis, and that they are more or less fat. A still stronger proof is found in a similar change in the muscles of dead bodies buried under circumstances which prevent their decay. The flesh gradually turns into this peculiar fatty substance. That there is a little fat in the system, which seems to be needed as a cushion, for example, in the orbit of the eye and the soles of the feet, is admitted; some say in the nerves and brain also; though we are not well acquainted with the nature of these substances. But in case of the great animal adipose tissue which we use in cooking and as fat meat, we think the facts which have passed under our review strongly indicate that it is dead matter, and this is sufficient to account for its lack of nutrition and its entire unsuitability for food. JULIA COLMAN.

AN OLD MILLER ON WHEAT AS FOOD.

As time goes on, more and more testimony is added to the long array which supports the opinion of hygienists with regard to food. Most of this testimony comes now from unhygienic sources, from men and women whose practical experience, perhaps covering a long life, is embodied in it. Now, for instance, we have the statement of an old farmer regarding the value of wheat in different forms of preparation as food. Mr. R. Moody, of Maine, writes to the New York *Tribune* as follows: "On farms that have been cropped many years, and have not been supplied with enough of the proper kind of plant food to perfect the growth, wheat is much inferior in quality as well as in quantity to what it was half a century ago. Fifty-five or fifty-six years since, I began flouring wheat in this place, and am now doing the same (at seventy-two years of age), and can see a marked decline in the condition of the grain as it is brought to the mill; but I have never seen or heard of any process by which I thought flour from any quality of wheat could be improved further than to free it from all foreign substance, and clean perfectly the exterior of the wheat; then if the wheat is perfected in growth and well cared for, it is, when well ground and bolted, fit food for man, but better if not bolted or sifted at all. I think fresh ground the best; age will whiten the flour, but all improvement in whiteness (if it is an improvement) causes corresponding depreciation in strength. And yet the present strife among millers seems to be to ascertain who shall lead in making the whitest flour, and especially the whitest from the middlings. The result is that the manufacturer who makes the whitest from sound and clean grain deprives the consumer of the most life-sustaining elements. The manu-

facturers spend millions in improved machinery to divest the flour of its most essential parts, which the consumers have to pay twice dearly for; first, the great cost of machinery in cash; second, and most essential, the enervating condition of the physical system, which in these days is not over-taxed with nerve-food or sunlight. But so long as the eyes of the masses are their gods, I presume they will subject both the inner and outer man to all kinds of torture for this visionary gratification."

A NEW "REMEDY" FOR DROPSY.—Some of the medical organs announce a discovery which appears to us like a return to the barbaric practices of mediæval time. We are told that in Russia the common cockroach is a favorite popular remedy for dropsy. Dr. P. Bogomolow, of St. Petersburg, has lately examined its effects in nine cases of Bright's disease, heart disease, and other affections accompanied with severe dropsy, and the result was uniform in each case, as the following: There was an increase in the secretion of the urine and perspiration, with rapid disappearance of œdema, and also almost complete disappearance from the urine of albumen and renal derivatives. The dose was from five to ten grains of the powdered cockroaches in the twenty-four hours, but they were administered as a tincture and as an infusion. These insects do not, like cantharides, produce any irritant action on the kidneys. Dr. Bogomolow has succeeded in extracting from them a crystalline body which he calls anthiydropin, and which is their active principle.

RECORD OF SCIENTIFIC DISCOVERY.

A Question in Optics.—EDITOR PHRENOLOGICAL JOURNAL: I am a little surprised that Mr. Fairfield should still maintain that the two statements which he made and which I called in question, are accurate. That he might have made a slip of the pen or memory in the first place is supposable; that he should maintain the truth of such obviously erroneous views after his attention had been called thereto is, to say the least, extraordinary.

Mr. Fairfield's propositions are as follows:

1. "When a ray of light passes from a refracting medium of lesser into one of greater density, it enters the latter at right angles to the plane of its surface." And

2. "If a sphere of solid glass is fitted into an aperture in a dark screen, and the light of a gas jet is directed upon it, each ray is refracted toward the center of the sphere; and as all the rays meet at that point, a perfect representation of the jet is presented within the ball."

It was to these two propositions, as laid down and figured out by Mr. Fairfield, that I took exception. I did not then, and do not now, concern myself with the question as to the shape of the blood-corpuscle. It will be time enough to attack the latter question when the elementary optical problems have been settled. That these two propositions are radically and entirely erroneous must be so well known by every careful student of optics that it seems like a waste of time and of your valuable space to refute them; but since they have found their way into your pages it may not be out of place to set those whom Mr. Fairfield is very fond of calling "lay" readers right.

The questions in dispute may be decided in one of two ways: We may give a mathematical and experimental demonstration of them, or we may call in the evidence of some well-known and generally recognized authority. Of such authorities there are scores—all easily accessible to the readers of your JOURNAL, and therefore why Mr. Fairfield should refer to a German book and one somewhat difficult of access to most of your readers, I confess myself unable to understand. Some one of the works of Brewster, Carpenter, Hogg, Deschanel, Frey, Silliman, Ganot, Draper, Quekett, and dozens of others may be found in any library or any book-store; and as they are in English, they can be generally understood. *Das Microskop*, by Nägeli und Schwendenner, is in German, and there are probably not over a hundred copies in the United States. As an early copy of the last edition reached me, I am somewhat familiar with its contents; and what will your readers think when I tell them that it does not at all touch upon the questions at issue! The authors devote scarcely any space to elementary optics and do not treat of blood corpuscles at all, the work being almost wholly occupied with the applications of the microscope to botany!

The first proposition of Mr. Fairfield is that a ray of light passing from a refracting medium of lesser into one of greater density, enters the latter at right angles to the plane of its surface, and he figures the rays of light reflected from the mirror impingeing on the

slide and cover, and passing through both at right angles. The accompanying figure 1 was originally given by Ross to illustrate the course of the rays, OTR and O′T′R′ through the thin glass, G G G G, usually employed to cover microscopic objects. It will be seen that they do not pass through the glass at right angles; in short, that they obey a law very different from that laid down in words and figured out by Mr. Fairfield in your July

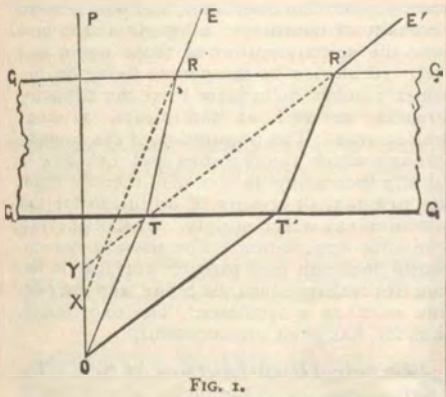


FIG. 1.

issue. The figure given above has been accepted as correct by Carpenter, Brewster, Hogg, Pelletan, and a host of others, including Nägeli and Schwendenner, in whose work it appears as Fig. 26. How Mr. Fairfield could, in the face of this fact, claim that the work of these eminent microscopists "shows the soundness of his position," I can not understand. Mr. Fairfield, in his first article, figured very definitely what he supposed to be the course of the rays through a sphere of glass or blood. The accompanying figure 2 gives the course of the rays through a sphere of glass as laid down by Sir David Brewster. It is an accurate transfer of figure 26 of the American edition of his Treatise on Optics, which is very common. Here it will be seen that the rays H R and H′ R′ instead of meeting at the center meet beyond the sphere at F, the distance of which is equal to the radius, and Brewster tells us further that if the sphere were one inch in diameter and made of the following substances, the focal distances (that is, the point at which the rays would meet) would be as follows:

INDEX OF REFRACTION.	DISTANCE OF THE FOCUS FROM THE SPHERE.
Tabasheer, 1.11145	4 inches.
Water, 1.3358	1 "
Glass, 1.500	½ "
Zircon, 2.000	0 "

And it is only in the case of spheres made of diamond or some substance having an index of refraction higher than 2.000 that the focus falls within the sphere.

It is a noticeable feature of Mr. Fairfield's writings that he constantly speaks of "my (his) best glasses" and refers, as in his recent article in the New York *Sun*, to his long experience and great skill with the microscope. And in view of all this he pronounces my experiment with the thermometer bulb "clumsy and inexact boy's play." Now Mr. Fairfield should remember that other people probably have glasses quite as good as those in his possession. I have some very excellent ones myself by some of the best makers in the world; but I am sorry to be obliged to think that all your readers are not provided with good compound microscopes. I therefore selected an experiment which any boy, however "clumsy and inexact," could try. It was no less an authority than the great Faraday, who said on one occassion, "I like a boy's experiment." Mr. Fairfield seems to like experiments which are so complicated that I am very sure he does not undersand them. My proposition and the experiment to prove it are simple, direct, exact, and easily repeated. The proposition is this: If the focus of a sphere is at its center, then it must be impossible for us to see any object through a sphere, for if the rays emerge as figured by Mr. Fairfield, they scatter in every direction and can not afterward possibly unite to form an image. But spheres of glass *do* form images, and make the best simple microscopes we have, for a well-made Coddington lens is a perfect sphere, at least so far as its acting surfaces are concerned. Every one has seen those spherical glass watch-charms that are so common. They form excellent magnifiers. The bulb of a broken thermometer, filled with water, makes an excellent magnifier—better than any of the fifty-cent microscopes so freely advertised, and its focus is certainly not at its center.

In discussing the question of the relation of the radius of curvature to the focal length of a lens, Mr. Fairfield seems to be ignorant of the fact that in the usual theoretical disquisitions on this subject, the *thickness* of the lens is not considered in the first approximation, as is distinctly stated in Potter's Optics, page 73. In the case of lenses of long focus, like spectacle glasses, the thickness of the lens has but slight influence; in the case of a lens having the form of a sphere, the thickness exerts a sufficient influence to move the focus from the center to a point outside of

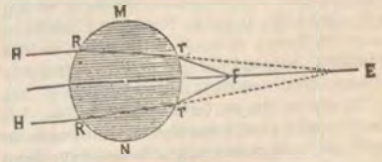

FIG. 2.

the sphere, provided the index of refraction does not exceed 1.999. I am sorry to be obliged to believe that Mr. Fairfield is in error when he assumes that every boy of twelve understands these things or that the principles of the compound microscope are familiar to "men rudimentarily acquainted with science." My experience is that very few of the ordinarily intelligent and well educated persons that we meet are able

to trace the course of the rays through a lens and give the proper angles due to the refractive indices of the various substances under consideration. Indeed, very few of those who have received a scientific education are able to do it. This being the case, perhaps the space that we have occupied in discussing these questions has not been altogether wasted. JOHN PHIN.

Researches of Last Year.—Forty-ve scientific expeditions were fitted out during the year 1876. Of these, twenty-four had their field in Europe, seven in Africa, five in America, and two in Oceanica. The objects of the researches included archæology, natural history, anthropology, medicine, statistics, comparative legislation, comparative history of religions, philosophy, geography, geodesy, and astronomy. In addition, organized researches were also made among archives and in libraries.

A Polar Colony.—Captain Howgate, an officer in the American Signal Corps, has proposed an expedition having in view the establishment of a colony at an accessible point in the Arctic regions, which may constitute a base for a series of attempts to attain the pole. This expedition has already been arranged, Captain Tyson of Polaris fame being the commander.

Some years ago it was suggested through the columns of THE PHRENOLOGICAL JOURNAL that the only feasible method by which the North Pole could be reached, would be by a chain of settlements where supplies might be accumulated and protection and support afforded expeditionary parties.

A Correspondent of an English journal, writing of his visit to Pompeii, after a long interval, comments upon the progress of excavations there. He says that about two-fifths of the city have already been disinterred, and the excavations are now being carried on by an average number of one hundred men, toward the east or north-east. To the museum fresh bodies, or their forms in plaster of Paris, are constantly added. He writes: "Years have passed since I was present at the first ingenious experiment which was made by the present Senator Fiorelli to recover the forms at least of the dead, so that it is with no slight interest that I regard any progress, and considerable progress has been made in the mode of preservation. It often happens that, from the superincumbent weight and other causes, the bones have been displaced—these are now removed from the *débris* as far as possible, so that the figure is not deformed by bones protruding from wrong places. This was first attempted in 1873, and has been continued ever since with great success. Perhaps the most beautiful figure in the collection is that of a young girl, exquisitely formed; she is lying on her face, while her hand was evidently attempting to cover her eyes. The folds of her dress, the very texture, and her hair, are all sharply defined. Near her lay, and lies, a man on his back, and by his side was, and is, an iron rod, four feet long, with which it is supposed he was forcing a road. Close by is another female figure, with iron sandals attached to the feet, the bones of which are well preserved."

River-Water Pollution.—Major Frank Bolton, the London water examiner, states in his monthly report that the deterioration of the waters of the Thames and Lea by sewage pollution continues, and points to the necessity of measures being adopted to prevent the contamination of those rivers and their tributaries by the people living on the upper reaches, who now treat the tributary streams, as well as the rivers, as common sewers. The population of the country through which the Thames and Lea flow is rapidly increasing in density, thereby tending to establish centers of pollution for the metropolitan water supply. Paris is having a similar experience. The sewage has recently been run into vats for purification before its discharge into the Seine, and the residue used as a fertilizer. The experiment, thus far, has been unsuccessful.

Electric Illumination at Sea.—The English iron-clad *Alexandria*, supposed to be the finest afloat, has an electric lamp attached to its foremast. The *Polytechnic* says the cost of the lamp and the necessary electric apparatus was £1,000, a sum which seems enormous at first, but does not appear so very extravagant when we reflect that it is purposed to protect a ship the insurance of which amounts to £600,000. The electric light serves two purposes: first, as a beacon light to point out dangerous reefs of rock or sand; and second, as a protection against torpedo boats. The light is thrown out from all sides of the lamp, and illuminates such a large surface of the water that it would be almost impossible for a torpedo boat to approach without detection; especially as the light falling upon the smoke would suffer such refraction as to make the boat's existence even more apparent than if the light had but fallen on its surface. This latter function of the electric light is very important, since ships have heretofore found no protection against the attacks of the torpedo boat.

A New Property of Oxygen.—Recent investigations, according to the *Journal of Chemistry*, have disclosed the singular fact that oxygen under high pressure rapidly destroys all living beings and organic compounds. All varied phenomena of fermentation, in which the chemical action depends upon the presence of living organisms, are completely arrested by the action of compressed oxygen, even if exerted for only a brief time; while fermentations due to dissolved matter, like diastase, perfectly resist the influence. M. Bert, to whom this curious discovery is due, has found a practical application of it in the field of physiological research. The ripening of fruits is arrested by

exposure to compressed oxygen, and hence it must arise from cellular evolution. The poison of the scorpion, on the other hand, whether liquid, or dried and redissolved in water, entirely resists the action of the compressed gas. Such poisons evidently owe their power to chemical compounds akin to the vegetable alkaloids. Fresh vaccine matter, subjected for more than a week to oxygen under a pressure equal to fifty atmospheres, retained its virtue; from which it would appear that the active principle in vaccine matter is not certain living organisms or cells, as some have supposed. The virus of glanders, after similar treatment, quickly infected horses inoculated with it; and carbuncular blood, though freed from bacteria, was found to retain its dangerous properties after the same test. These must, therefore, be put in the same class with vaccine matter. If these results are confirmed by further investigations, the discovery is certainly a most important one, and will lead to the settlement of many disputed questions in physiological chemistry.

AGRICULTURAL HINTS.

[The mind is the man. Farming, in the highest sense, is not simply doing the hard work necessary. This can be done by muscle when directed by brains. The true farmer is he who can plan, direct, and control skillfully.]

As this department is one which should contain the most recent gleanings of wisdom and experience, our readers and friends in the rural districts are invited to send us any items of value to agriculturists in general, and which should have a wide circulation. Due credit will, in every case, be given to the contributor.

Killing Cut Worms.—A correspondent of the *Country Gentleman* thus advises on this point: "If the sod is turned early, say in February or March, let it stand until just before planting time, when it will have a good coat of green vegetation, which turned under will afford sufficient food for some time; and by the time the corn makes its appearance many of the worms will have become grown, and have left. They usually leave with the advent of warm weather. As a general thing they do but little damage, for they seldom cut a plant down below the bud, and it readily comes up again, and soon gets strong enough to withstand their ravages until hot weather. Your correspondent is mistaken, (?) I think, when he says that by ploughing early in the spring so that the ground freshly turned would freeze, he killed the worms. I have never experienced any benefit from this mode. In fact I believe freezing will kill few if any grubs already in a torpid state."

Different Birds as Insect Destroyers.—In 1858 Prof. Jenks devoted a season to determining the character of the robin. He found that in March, April, and May, their whole food was insectivorous; from the last of June till October the robin's stomach contained both insects and berries; and after July their diet was mostly grasshoppers. This for Massachusetts: Prof. Treadwell, of Cambridge, demonstrated that each young robin ate to exceed his own weight each day. As during the nesting season in spring, their chief article of food is the cutworm, we can realize in part what a benefit the robin is to agriculture. Indeed the onion, cabbage, and radish crops are almost dependent on birds for their successful culture, as during seasons when birds are scarce the caterpillar is unusually destructive.

The oriole, or golden robin, feeds on the curculio. The cat-bird seeks the grubs of the May beetle and the tent caterpillar; and according to Dr. Kirtland, a flock of jays taking up their residence in a clump of evergreens near his garden, cleaned the whole neighborhood of this obnoxious caterpillar.

Fowl Crossing for Profit.—In the spring purchase a bright, healthy young cockerel of pure blood and one of the small breeds—such as Leghorn, Hamburg, Game, or Dorking. Put him with twelve to twenty common or pure-blooded hens of the large breeds—Cochin, Brahma, etc.—and with due care and attention you will have chickens which will not be excelled by any either for eating or laying. I am acquainted with a large number of eminent poulterers in Massachusetts who have tried this plan, and every one of them pronounces it to be superior to any other they have ever tried for producing eggs. If care is taken in the selection of the stock, great beauty may be obtained in the progeny—for example, by putting a brown Leghorn cockerel with buff Cochin hens, or a white Dorking cockerel with white Cochin hens. My own choice is a brown Leghorn cock with black Cochin hens. The progeny from these will have black bodies from the hens, and neck and comb from the male bird; but either of these crosses are equally good if the distinctions I have noted are observed.

Grain Production.—Europe produces now on an average 5,000,000,000 bushels, of which Russia produces one-third, Germany and France 520,000,000 bushels each, and Austria, 500,000,000. The United States produces 1,600,000,000 bushels, or about the same as Russia. In order, however, to appreciate the advantage of the United States, the population should be taken into account, this is, for the United States, 40,000,000, and therefore we produce forty bushels per head; while Europe, with a population of not quite 300,000,000, produces only sixteen bushels per head, Russia twenty-six bushels per head, and Great Britain only four bushels per head. As the average quanti-

ty of grain consumed per head is fifteen bushels, we produce three times as much as we want, Russia scarcely twice its wants, Europe on an average all needed, but Great Britain not much over one-fourth. It will be seen that the general production far surpasses the consumption, but this excess is absorbed by breweries and distilleries all over the world, which do more to keep up breadstuffs at a high figure than anything else.—*Manufacturer and Builder.*

Floor Paint.—There is but one paint suitable for floors, and this is French ochre. First, if the boards have shrunk, clean out the joints well, and with a small brush give a heavy coat of boiled linseed oil, then putty up solid. Now paint the whole floor with a mixture of much oil and little ochre for the first coat, then, after it is well dried, give two more coats of much ochre and little oil, finally finish with a coat of first-rate copal varnish. This is an extremely durable paint for floors, in-doors or out, such as verandas, porticoes, and the like. A floor stain is best mixed with oil and finally varnished.

To Prepare Vegetable Mould.—As early in November as the leaves of trees can be collected, let them be brought in a considerable quantity, into a close place, and dressed up there in the form of a hot-bed. Let this be well saturated with the drainings from the dung-heap, with suds from the wash-house, with urine from the stable and cow-house, where this latter article can be procured. Let this bed or heap be covered and lined with fresh stable dung, to make it heat. When the heat is sufficiently subsided, let the leaves be uncovered and turned over, to mix the dry and the wet well together, and if moisture be required, let them have it of the same description, repeating the process till all be reduced to fine mould. This will be ready for use in two months from the time of collecting the leaves, and to prevent any waste of the liquid recommended, a layer of maiden earth, of two feet thick, should be made the substratum, which would receive any of the valuable liquid that would otherwise run to waste. Leaves of slow decomposition should be avoided, as those of the oak, etc., which, however, are the best for retaining heat in hot-beds and pits. The leaves of Fir should also be avoided, but those of the Sycamore, Elm, Alder, Maple, and all the soft kinds are better suited for the purpose. This compost should be kept dry, in an airy place, and ridged up, so that the rain can not wash out the salts with which it abounds.—*Gardener's Record.*

Cheap and Easy Drainage.—There is in use in some parts of the country a very cheap and practical method of underdrainage, which farmers properly circumstanced can employ to advantage, but which is seldom mentioned in the agricultural papers. The plan is most effectually adopted wherever, at a depth of a few, or perhaps several feet, a strata of clay or hard-pan, through which water will not penetrate, overlies gravel, or other porous substance, when, if a shaft is dug through the clay formation and into the gravel or sand below it, a vast amount of water will find a natural subterranean and perfect outlet at a very light expense. Several members have stated at the Batavia Farmers' Club that in instances where they found a low place on their land, where water was inclined to stand, they, in a dry time, dug a hole, as for a well, down through this clay, then filled the hole with any refuse stone and removed the excavated earth so as to let the drainage into this pit, and after that no water was ever seen standing there any more. The same plan was practiced in Batavia village, where, on Main Street, water in wet times had flooded the surface for rods, and it was thought to be a difficult and expensive job to properly drain it away; but as the corporation extended it chose for Street Commissioner a farmer who had practiced the method described, and he had a hole sunk at the lowest point on each side of the street, which, after filling with stone and leveling, secured the perfect drainage desired. Thus, at an expense of a few dollars only, was obtained a result which it might easily have cost a few hundred dollars to have effected in any other way.—*Tribune.*

Why not?—Our scientists tell us that after all there is not so much difference between animal and vegetable life as some think. We know that even in one generation a half-starved animal will deteriorate, and that three or four generations of such treatment will dwarf and decrease any race of animals. Is it not probable that, under the same or similar circumstances, grain will deteriorate not only in quantity, but also in quality? If the crop is supplied with the proper kind of food, properly worked and cared for, we do not believe that it will deteriorate any more than an animal. We know of instances where the same corn has been cultivated for thirty years on the same farm, and still, so far from deteriorating, has increased in production and value. It is a firm belief with many (and facts seem to support it) that seed taken from a thin, barren soil, and planted in a rich and productive one, will produce better than seed which had been grown there for several generations.

Improved Mortar.—A French authority recommends the use of sawdust instead of hair in mortar to prevent its peeling off. His own house, exposed to prolonged storms on the sea coast, had patches of mortar to be renewed every spring, and after trying, without effect, a number of substitutes, he found sawdust perfectly satisfactory. It was first thoroughly dried and sifted through an ordinary grain sieve, to remove the larger particles. The mortar was made by mixing one part cement, two lime, two sawdust, and five sharp sand, the sawdust being first well mixed dry with the cement and sand.

MRS. C. FOWLER WELLS, *Proprietor.*
H. S. DRAYTON, A.M., *Editor.* N. SIZER, *Associate.*

NEW YORK,
NOVEMBER, 1877.

PERSONAL INDEBTEDNESS.

CABINET COLLOQUY, NO. V.

DURING the early hours of one of those close, muggy days, which we New Yorkers experienced near the middle of last September, a gentleman called at our rooms and introduced himself as an old reader of the PHRENOLOGICAL. We, of course, bade him welcome, and accompanied him in a survey of our Cabinet and rooms. In the course of the interview he remarked:

"I think it just on my part to say that I owe my condition, what I am to-day, to the teachings of your JOURNAL. I took it for upward of fourteen years, read it carefully, studied it, depended upon it for advice and instruction, and endeavored to follow its excellent teaching. It cleared up many of my doubts; it gave me new views of life, suggested new ways of thought and life, and stimulated me to effort in directions which I wouldn't have thought of, had I not been a reader. I will say this of myself—for I feel my indebtedness—but I am almost ashamed to say, however, that on account of my business compelling me to travel a good deal, I have not taken it for two or three years past."

"You have a family?" we inquired.

"Yes."

"Then why not give them the benefit of the reading which has profited you so much?"

"I have certainly thought of re-subscribing, but somehow or other neglected to do it. But shall do so."

"Do you not think, sir, that such work as the PHRENOLOGICAL JOURNAL is carrying on should be supported?"

"Most assuredly. I can think of no other enterprise better calculated to improve the moral and intellectual condition of society. It is everything that is philanthropic."

"Then, my friend, why should we not look to such as you, who so heartily acknowledge personal benefit through its instrumentality, for aid and coöperation in carrying on its good work?"

"You are indeed right, and my negligence deserves reproof. How much disposed we are, we busy men, to grab all the good we can get and forget the source of it!"

"Not so much that, I think. You subscribed and paid for the copies of the magazine—a business transaction—and you were warranted in making what use you pleased of the reading material it contained. You were wise enough to see and appreciate the merits of it. But you probably did not think of extending to others its advantages. In the activity of your business life you may have had little time to spare."

"That was the case, sir. But I might have exhibited a more generous spirit. I did often speak of the work you phrenologists were doing as reformers, but did not take any pains to bring it to the knowledge of others. Now I see that I have been derelict in my duty as a man and a father. What more easy than placing an earnest advocate of truth, like your JOURNAL, in the hands of a young man or woman!"

"We should be glad to have the ability to supply the youth of America with it."

"May you obtain the ability," said our visitor. "Nothing would be productive of more substantial good. I shall do what I can to further the end."

A few hours later in the same day a Southern gentleman dropped in and leisurely made the tour of our office. On greeting him, he said, "I am Mr. M—, of ——, an old subscriber, as you will see by reference to your books. I have been a reader of the JOURNAL many years, and would as soon think of giving up my dinner as doing without it. My family look for its coming every month, and would have it published oftener if they had their way. Besides, I have caused it to be sent to one or two relations, who also prize it very highly."

Of course, this visitor interested us deeply, and we entered into a free discussion of the present *status* of Phrenology and the prospects of the PHRENOLOGICAL, and after a half hour's interview, which we trust proved as refreshing and edifying to this worthy man as it did to us, he took his leave.

Not long ago one of the leading religious weeklies of our city took occasion, in a reply to a correspondent, to depreciate the value and utility of Phrenology, and made use of somewhat caustic language. We are not given to boasting, but so far as the accomplishment of solid practical good to society is concerned, we are ready to compare the record of the PHRENOLOGICAL JOURNAL during its thirty-nine years' career with the record of that weekly. The visitors, of whose statements we have just given an abridgment, are both gentlemen of high respectability and in Christian connections, and are but two, of hundreds like them, who have borne witness to the worthiness of the teachings of Phrenology.

RIFLE SHOOTING.

THE recent shooting match between the English and American teams resulted, as every one knows, in a victory for the Americans, with better scores for both sides than had ever before been made at an international match. We will confess to some interest in this sort of sport, because we discern in it features of real excellence. Unlike horse-racing or base-ball playing, it brings into activity higher faculties of the mind, and affords a kind of training which has thus far proved valuable to our young men, and is not without a good influence upon the political relations subsisting between England and the United States.

The young men who derive the most benefit are of that well-to-do class that can afford to indulge their taste for amusement and recreation almost at their pleasure. These young men of fortune, attracted by the éclat of successful marksmanship, soon find on trial that weak nerves, feeble muscles, a disordered digestion, are incompatible with a good score, and therefore that the practices of eating, drinking, smoking, chewing, irregular sleeping, and doing that which conduces to physical exhaustion, unfit a man for excellence at the target. The easy self-poise, steady hand, unflinching eye, and endurance of a protracted contest are concomitants only of a good organization and a temperate life. When our young gentlemen, in their earnestness to succeed as riflemen, adopt the habits of temperance and frugality, they influence the entire community of young men, since those in the lower walks of society readily copy when they can the manners of the wealthy and privileged.

Besides this tendency to regulate the physical habits, the practice of rifle shooting affords a sort of intellectual training. It

sharpens the perception, contributes to directness and precision of thought, and brings out a man's practical talent. For these and similar reasons, that large class of persons which is ever on the watch to make capital of everything allied to popular recreation, can not so easily convert a shooting match into a gambling convenience, or an occasion for revelry and brawling. Betting and drinking have about destroyed the respectability of base-ball play, and the roughs who make betting and drinking the leading features of their life, have already endeavored to introduce their favorite practices into rifle shooting, but with little or no success among those practically interested in the sport.

A brief consideration of the men who figure most conspicuously as marksmen will satisfy almost any one with regard to the special organization which is at the basis of their proficiency. In them all there are an overhang and a breadth of brow which betoken large perceptive organs, and also an intensity and liveliness of eye-expression which indicate perceptive activity. Take the faces of Messrs. Hyde, Jewell, Allen, Lamb, Blydenburgh, and Gen. Dakin, of the Americans, and of Sir Henry Halford and Messrs. Milner, Rigby, Fergusson, and Gilder, of the British team, and one can not help being struck with their very marked development of the organs of Size, Weight, Locality, and Individuality. The massiveness of these organs imparts a deep-set, cavernous appearance to the eyes, which in nearly every instance are but moderate in size, indicating scarcely more than an average development of Language.

A study of the portraits of the gentlemen composing the British and American teams, published soon after the match in *Harper's Weekly*, with the assistance of the phrenological organology, will furnish any one desirous of seeing for himself the reasons for their excellence at the target. In the matter of temperament, the motive or muscular appears to predominate, the mental or nervous organism being next in conspicuity, while the vital is associated as an adjuvant to the muscular and nervous forces, and not as a master. The gentlemen we have named do not carry the signs of slavish subordination to any of the forms of appetite, while the most of them have the unmistakable expression of the sober and temperate life, and of the mental refinement coincident therewith.

RUSSELL T. TRALL, M.D.

ANOTHER friend of humanity, and one most active in the cause of reform, has suddenly left us. Dr. Russell T. Trall, the first exponent of practical Water-Cure, and for many years the recognized leader in hygienic and medical reforms, died in the night of the 23d of September. A few days previously he had taken cold while working in his garden at Florence Heights, N. J., but evidently deemed his indisposition of little moment, as he declined any treatment for its relief. Pneumonia supervened and with fatal result. The sad intelligence comes too late for us to make more than a brief mention of the occurrence in this number. In the next we shall publish an account of Dr. Trall's interesting career and accompany it with a portrait.

"AS A MAN THINKETH, SO IS HE."

THE intelligence of the period is becoming more and more impressed with the influence of hereditary traits, or, what is the same thing, special organization upon the character and life of men; a paragraph in the New York *Library Table* shows that our literature is becoming permeated with physiological truth, viz.:

"In the course of a very enlightened note on William F. Gill's 'Life of Edgar Allan Poe,' the *Atlantic Monthly* has some observations that are too eminently valuable to be left buried in magazine minion; and hence, without attempting any quotation, it is a pleasure to call popular attention to them. Mr. Howells briefly notes the predestination to misfortune that appears in Poe's career, and compares the American poet with the unfortunate Alfred de Musset as one of the most intimate parallels furnished by literary history. There is a deep pathos undoubtedly in such lives as Poe's—lives that seem doomed from the outset; but the pathos must not blind our judgment to the fact that the failure arises directly from inherent weakness. There is no truth more often forgotten than that fate is but a verbal symbol for one's own soul, and that the seeds of our misfortunes in the world are all within ourselves. A man's biography is but the record his soul leaves in its passage through the world. The contradiction in Poe's nature was that he had no conception of sincerity. Impulsive, passionate, wayward, he was an actor in everything he did, and his associates soon learned that his brilliant intellect was unguided by conscience."

This is but a graceful recognition of one of the fundamental principles of phrenological science, and for which its early teachers were reviled and stigmatized as atheists, infidels, and materialists, whereas they were only declaring the results of careful observation and the conclusions of the soundest practical philosophy.

A proper understanding of the principles of heredity will help to improve the mental and physical condition of society more than any other agency of human discovery.

DOESN'T NEED IT FOR STRENGTH.—Ahmed Mukhtar Pasha, who has shown the most ability as a commander in the Turkish army, is the idol of his troops. He lives very frugally, much as the common soldiers do; never eats flesh meat in his campaigns—the very time he should need it most, if it give strength to body or mind, one would think. Nor does he touch alcoholic beverages; and, strangest of all for a Turk, he does not smoke.

His dress, like his habits, is of the plainest. No wonder that he is a difficult subject for the Russians to handle.

SHOULD IT BE SO?

WE may not understand it, but when we read in the newspapers of men who have organized themselves into a society for the avowed purpose of promoting their special line of commercial operations—of course having in view their own personal convenience and profit—when we read of their assembling together and determining upon certain prices to be demanded for articles which take the chief places in the catalogue of human necessaries, we are inclined to think that such men would, if the opportunity were given them, store up the atmosphere and sell it by the foot, and now and then get into a wrangle among themselves on account of a "corner."

We have no protest to enter against dealers in corn, wheat, oats, potatoes, coal, wood, etc., associating for the purpose of facilitating their business operations by devising methods for the easy and quick transportation of the required supplies from the producer to the consumer. As society is constituted, there must be dealers, middlemen, to market the produce of the field, orchard, and mine, and for their labor they are entitled to a fair profit. But when such men concert to fix the prices of commodities with little consideration for the requirements of the consumer, we feel compelled to enter our most solemn objection.

We would make the sale of the neces-

saries of life as free as it were possible consistently with the sanitary welfare of the community, permitting, of course, the matter of prices to depend mainly upon the conditions of supply and demand. In the furtherance of this object we would have producer and consumer brought face to face, that each might learn the other's needs and interests, and make common cause for each other's benefit. A great part of the complaining which is heard on both sides is due to the lack of knowledge on each side of the other side's condition.

The tendency of our later civilization is toward an increased differentiation in the methods of trade as in the modes of education and association, and the distance between producer and consumer may grow wider and wider, with the increase of differentiations, yet so long as the mill and the market are readily accessible to both producer and consumer, they should not permit the dealer or middleman to exercise an almost absolute control over matters in which they are chiefly concerned.

THE LATE D. H. JACQUES.

THE announcement of the sudden death of this gentleman on the 25th of August was an occasion of deep regret to us and to all who had any acquaintance with him. He possessed a mind of superior tone and culture, a character distinguished for gentleness and sympathy. Early in life he gave attention to the pursuits of literature and contributed to different publications, besides writing and editing many volumes. His field of thought and effort was mainly that of popular education, and in it he—although perhaps little known by name to the population at large—exerted a wide-spread influence. His teaching has ever been characterized by purity of motive and clearness of method. For several years he was associated in the editorial conduct of the PHRENOLOGICAL JOURNAL, and while in this relation prepared the well-known "Handbooks for Home Improvement," the "Rural Manuals," and the admirable physiological treatise entitled "Physical Perfection." About ten years ago he left New York to assume the editorship of *The Rural Carolinian*, and in a short time made that new venture the representative agricultural organ of the South. A year or two since he retired to Fernandina, Fla., where he continued to pursue his literary and horticultural tastes, being the chief contributor to the *Semi-Tropical*, a live and influential magazine published at Jacksonville. Mr. Jacques was regarded in the Southern States as a leading authority in agricultural matters. He organized the Order of the Patrons of Husbandry in South Carolina, and was looked up to as one of its chief supporters.

GOOD LEGISLATION.

THE Aldermen of New York City have done a wise thing in voting an ordinance prohibitory of the miscellaneous practice of carrying pistols.

By the terms of this new regulation, persons taken into custody for disorderly conduct on whom a pistol of any kind is found, shall be fined or imprisoned, at the discretion of the Police Justice before whom the complaint is made, the fine not to exceed $100 or the imprisonment one hundred days. All respectable and law-abiding citizens who may need to carry such a weapon within the city limits must apply for a permit to the Police Superintendent.

If this ordinance be carried into effect with vigor, it will do much toward checking disorder and bloodshed among the

vicious and law-breaking classes. Many a ruffian would lose half his brutality by being deprived of his pistol; and most of the other half by being prevented from drinking whisky or other alcoholic poisons.

We would go further than this measure of the New York authorities, and prohibit absolutely the carrying of deadly weapons, the pistol and the dagger, except by the regularly constituted guardians of public order. No law-abiding, honest man cares to walk abroad with a revolver in his pocket, and rowdies and loafers should not be permitted to do so.

Our Mentorial Bureau.

[In this Department will be noticed such matters as are of interest to correspondents and to the general reader. Contributions for "What They Say" should be brief, pointed, and creamy, to secure publication.]

To Our Correspondents.

QUESTIONS OF "GENERAL INTEREST" ONLY *will be answered in this department. But one question at a time, and that clearly stated, must be propounded, if a correspondent shall expect us to give him the benefit of an early consideration.*

IF AN INQUIRY FAIL TO RECEIVE ATTENTION *within two months, the correspondent should repeat it; if not then published, the inquirer may conclude that an answer is withheld, for good reasons, by the editor.*

WE CANNOT UNDERTAKE TO RETURN UNAVAILABLE CONTRIBUTIONS *unless the necessary postage is provided by the writers. In all cases, persons who communicate with us through the post-office should, if they expect a reply, inclose the return postage—stamps being preferred. Anonymous letters will not be considered.*

THE MOUSE.—What faculty is it which enables a mouse to hide so quickly?

Answer: In the first place he has no Self-esteem, and therefore he has no dignity to consult in his movements; secondly, he has large Cautiousness, which makes him cowardly in reference to danger, which he desires to hide from; thirdly, he is so small, that ideas, such as he has, can go to his extremities quickly and set them in motion; and lastly, there is so little of him to hide that room to hide in is easily found.

FLAT-HEAD INDIANS.—The practice on the part of the Flat-head tribes of compressing the anterior part of the brain alters its contour, but no part of the brain can be said to be essentially impaired. The organs are only pushed out of their proper location or relation. The observer in considering the organization of the Flat-head, must take into account the unnatural practice. He could not, of course, consider the brain thus forcibly modified from the point of view of the natural or undisturbed organization. Allusion has been made to this subject in our columns from time to time. A few years ago an article of considerable length was devoted to it.

NERVOUS TREMOR.—M. T.—The trouble you speak of is by no means uncommon, especially in young men occupying office clerkships. You probably possess a good degree of Conscientiousness, Approbativeness, Cautiousness, without a sufficient quantity of Self-esteem to give you steadiness and full self-reliance. Endeavor in your trying situation to forget yourself, or the proximity of the employer. By doing your duty thoroughly, you will have no occasion for doubt or misgiving, and the consciousness of honest effort and the performance of duty will help you to meet this disagreeable imposition. We know that it is very trying to be watched, and we also know that straightforward conduct will offset in very great measure the susceptibility to excitement, and ultimately win the esteem of others.

WEAKNESS OF BACK—KIDNEY DISEASE.—It may be that your kidneys are somewhat affected; but we think that a careful, nutritious diet, abundance of sleep, and a good degree of out-door exercise will help to overcome it, even if there be an hereditary taint. If you could have a good hand-rub morning and night, it would help you. Perhaps much of your trouble arises from morbid thought. You probably entertain with too much anxiety the notion that you have inherited functional disease. If you could set aside all thought of this character it would be well. An out-door employment would be beneficial, and we would counsel a change of vocation in that behalf.

TELEGRAPHIC PARALYSIS.—E. A. H.—The communication from the *Journal of the Telegraph*, which you quote, sets forth a malady with

which we are familiar. We have had occasion once or twice to answer a correspondent with regard to it. The peculiar nature of the telegraphic employment induces the affection, and we can suggest no other course with a view to its cure or relief than an occasional withdrawal from such employment. The occupation being a sedentary one, with a partial yet constant use of a few muscles, imposes a considerable strain upon the nervous system. It appears to be a fact that we feel warranted in asserting, on the ground of our own observation, that those who are most likely to be affected by such a malady, make the best telegraphers on account of the predominance of the nervous temperament in their organization. It is this nervous excess which gives them the susceptibility requisite for skill in receiving dispatches and sending them.

ELECTRO-THERAPEUTICS.—H. F. H.—In most of the forms of nervous disease electrical treatment by the hands of a skillful operator is beneficial. In some forms electricity furnishes the only safe treatment, and cures have been accomplished which had been despaired of by any other process known to medicine. We do not approve the various devices to which you allude, regarding the claims in their behalf as unwarranted from a scientific point of view. As substitutes for drug medicines, we are certainly in favor of them, and if cures follow their use, we would place them to the credit of Faith.

EXERCISE.—During the summer, muscular exercise is best taken before the sun is high and exercising its greatest power, and also late in the afternoon. In the winter one can exercise pretty vigorously all day. In fact, we find it quite necessary if out of doors much and exposed to the cold.

SOLDIERS AND COFFEE.—According to the late Dr. A. E. Parkes, who took observations during a campaign in Africa, soldiers on the march exhibit most endurance by abstaining altogether from stimulating drinks of any kind, coffee and tea included, and eating mainly of oatmeal gruel, brown bread, and a little prepared or preserved beef. The oatmeal gruel, however, formed the larger portion of the diet.

SIDEACHE.—L. J.—We are of opinion that your painful experiences are owing to indigestion. Perhaps milk does not agree with you. In fact, we have observed that few can partake freely of milk without experiencing more or less discomfort. It is readily absorbed, and is liable to clog the depurating organs. Rye flour is a good article, and as generally obtained from dealers in the city contains more nutrition than the average grades of superfine wheat flour. We would advise you to eat very little sugar or molasses, but rather plenty of fruit at meal-time, especially of the fresh sorts.

AVERSION TO NUDITY.—We presume that the common aversion to being divested altogether of one's clothing, particularly when in a conspicuous relation to society, is due to the long-established habit of wearing clothes. In Paradisaic time man lived in a very warm region, and conventional usage dispensed with clothing, so people did not feel particularly embarrassed. This matter of costume is on the whole a subject of climate and of habit.

FOOD FOR STUDENTS.—I would like to know what is the best food that a student can use?

Answer: We will say to our correspondent that he should avoid pork and other greasy food in the main; that he should keep clear from all the pungent condiments—such as spices, mustard, vinegar. He should avoid tobacco and coffee, fine flour, and mainly also sugar and butter. Sugar is a concentrated extract which produces heat and heat only. Butter is taken from milk, where it belongs, and produces only heat. Superfine flour is mostly heating material, and the man or beast confined to that solely as an article of food, would not reach a hundred days of life. You should avoid pies, cakes, and most of those made dishes of which starch, sugar, and butter are leading ingredients. You may eat fish and eggs; bread made of wheat ground without sifting; also oatmeal, fruits and vegetables. Wheat is complete food; so is oatmeal, as birds and animals, which will live on them solely if they can, bear testimony; and these really cover the whole ground of nutrition. The same is true of milk and of fish; and certainly potatoes, green peas, beans, and other vegetables, including fruit, constitute complete food. A student should eat liberally of wheat and oatmeal, fish and milk, with fruit, and little of beef and mutton. In the excellent "Letters to a Son in College" the subject of diet has been carefully discussed.

What They Say.

"GRAHAM FLOUR" TO ORDER.—In a note recently received from a subscriber who resides in a leading town of Maine, an incident is reported to the effect that a lady called at a grocery and asked for Graham meal. The clerk, not sufficiently initiated in the tricks of the trade to be reticent with regard to them, replied, "We have no Graham meal now, but I will make some in a few minutes for you." The lady exclaimed, "You make some! How do you make it?" "Why," the complaisant fellow answered, "we mix flour and shorts half and half. Mr. —— (the proprietor) made some last week, but it is all out

now." The lady concluded not to wait for him to supply her.

PROFESSIONAL EXAMINATIONS. — We often receive letters from those who have been examined expressing the benefit which they have derived. Such a letter has just come to hand, and reads as follows:

S. R. WELLS & Co.: On the first of November, 1876, I was in New York, and obtained a phrenological examination, written out in full, which has been of great value to me. And now I want to obtain an examination of a lady friend, and also to know if we are suited to enjoy the marriage relation together. Will it be necessary to send the photographs of both of us?

Yours, truly, ——

EMPIRE CITY, NEVADA, Aug. 27, 1877.

S. R. WELLS & Co.: *Gentlemen* — I received your letter and books August 24th, and description of character which you made from my photograph is, as far as I am able to judge of myself, correct and satisfactory. I have now become fully convinced of your ability to describe character, and believe it to be every person's interest, who intends studying for a professional career, to consult you. I am determined, if it is the will of God, to give Phrenology a thorough investigation, as it is the most important and useful of all the sciences. It enables us to measure our own capacity, to ascertain our strong and our weak points, to learn what sins most easily beset us, and what course to pursue to guard against them, and promote virtue, purity, and holiness; how to cultivate the faculties which are deficient or inactive, and how to restrain or control excessive or perverted action. Knowing ourselves aright, we can set about the work of self-improvement understandingly, and with the best of prospects for full success. As a guarantee of my earnestness, I enclose ten dollars, for which please forward to me the set of books which is desirable for students to read before entering the Phrenological Institute of New York. It is my intention to attend the Institute next summer, 1878. Yours, truly, ——

"SO LONG AS SHE REMAINS MY WIDOW."—It has long been a matter of speculation in my mind whether the above was not a bit of pleasantry with which a man proposes to solace his last hours. It is a gross wrong that the law permits this clause to be inserted in a will. The family cares of the wife have prevented her from entering the workshop and "boning into the hardwork," but she has no less taxed mind and body in the privacy of home to sustain him in his endeavors to promote the prosperity of the family by her frugality, economy, and cheerfulness, and what they two have gathered belongs as much to one as the other. The husband has the power to bequeath, even to strangers, the most of the property, and often has it recorded in the county records that his wife can have the *use* of all or a portion of the rest as long as she remains his widow! The masculine mind, sanctioned by legal statutes, repudiates the right of the wife to say to her husband, under like circumstances, "This you can *use* so long as you remain my widower," and he may soon seek some congenial soul to help him enjoy the property which No. 1 carefully saved.

Aside from the legal wrong, it is also a moral wrong. A woman left a widow feels the loneliness of her situation no less keenly than a man, and this clause in his "last will and testament" has a tendency to its evasion, as illustrated by a recent case in Brooklyn, N. Y., where the will of the husband stated that the property should go to others if his widow re-married. The lady feeling the injustice of the act, and desiring another husband, went to reside with him without formal ceremonies, whereupon the conditional heirs brought suit to claim the property.

Another case in point is that of a lady residing near New Hartford, N. Y., who several years ago married a dry-goods clerk. She was possessed of a large property, and soon after marriage the husband left his situation and devoted his whole attention to the care of his wife's estate. Under his management her property dwindled, while he, as years rolled on, grew rich and influential. On his death his will gave to several persons large bequests, and the *use* of what remained—aside from her right of dower—he gave to his wife as long as she remained his widow! Whatever the motive, it must be a grim satisfaction for a man to know that such a clause in his will would have a tendency to keep his memory green in the heart of his wife for as many years as she remains his widow.

ALICE HUNTLEY PAYNE.

WISDOM.

"Think truly, and thy thought
Shall be a fruitful seed."

THE best way to throw dice—throw them away.

AFTER all, our worst misfortunes never happen, and most miseries lie in anticipation.

I AM persuaded that every time a man smiles, but more so when he laughs, it adds something to his fragment of life.—STERNE.

WHEN I read Beethoven's life I said, I will never repine. When I heard his seventh symphony, I said, I will triumph.—MARGARET FULLER.

NO MATTER whether or not the men of the future happen to know your name; if they are unconsciously modified by your life it is enough.—E. P. TENNEY'S "Coronation."

A HEAD properly constituted can accommodate itself to whatever pillows the vicissitudes of fortune may place under it

WHO waits will come to sorrow;
He must not drive away
The vantage of the present,
The offer of to-day:
He must be up and doing
Some steady aim pursuing,
And while the sun is shining
Must not fail to make the hay.

IT is the great privilege of poverty to be happy unenvied, to be healthy without physics, secured without a guard, and to obtain from the bounty of nature what the great and wealthy are compelled to procure by the help of art.

MIRTH.

"A little nonsense now and then,
Is relished by the wisest men."

AT a recent dinner of shoemakers, the following toast was given: "May we have all the women to shoe and the men to boot."

"No," she said, and the wrinkles in her face smoothed out pleasantly, "No, I do not remember the last seventeen-year locusts. I was an infant then."

A TRAMP he entered a widow's cot,
One dark, uncanny night;
She felled him with a big slung-shot—
That was the widow's might.

THE following notice appeared on the west end of a country meeting-house: "Anybody sticking bills against this church will be prosecuted according to law or any other nuisance."

AN acrobatic Frenchman claims great credit for being able to "walk on the ceiling with his head down;" but if he wants to create a real sensation, let him walk on the ceiling with his head up.

"WHY did you name that old horse Napoleon?" asked a gentleman of a negro, whose horse was almost reduced to a skeleton. "Why, marse, you see it's caze the bony part is so strong in him."

"NEVER catch me marrying a reformed man," said a wise little Chicago girl; "when I get married it will be to some man that doesn't need reforming."

A MEDICAL journal gives the antidotes to a number of poisons, and adds: "These remedies must be given before the doctor comes." By all means. Give the patient at least one chance for his life.—*Louisville Courier-Journal.*

"MY son," said a mother to a little boy four years old, "whom above all others will you wish to see when you pass into the spirit world?" "Goliah!" shouted the child with joyous anticipation, "unless," he quickly added, "there's a bigger fellow there!"

A COUNTRY editor received the following: "Dear sir—I have looked carefully and patiently over your papers for months for the death of some individuals I was acquainted with, but as yet not a single soul I care anything about has dropped off. You will please to have my name erased."

HE was a very literal man and it was only his second visit. She was sitting at the piano reading the titles in her music book, and when she glanced sentimentally at him, repeating the words, "Why do summer roses fade?" he answered that he didn't know, but he had heard his father say that a dead cat laid at the roots of the bush in the spring-time would make the roses last all summer.

Library.

In this department we give short reviews of such NEW BOOKS *as publishers see fit to send us. In these reviews we seek to treat author and publisher satisfactorily and justly, and also to furnish our readers with such information as shall enable them to form an opinion of the desirability of any particular volume for personal use. It is our wish to notice the better class of books issuing from the press, and we invite publishers to favor us with their recent publications, especially those related in any way to mental or physiological science.*

DEVIL PUZZLERS AND OTHER STUDIES. By Frederick B. Perkins. 16mo, pp. 215, paper 50 cts. New York: G. P. Putnam's Sons.

This volume contrasts sharply with the common run of publications of the day, the miscellaneous and multiple "baby" books, and the olla podrida of stories about husbands, wives, grandmothers, etc., which have so much taken up popular attention. We would expect no nonsense from Mr. Perkins, even when he proposes to write nonsense, for his humor can not avoid the vein of practical satire. The series of essays—they are worthy the name—grouped in this well-printed little volume, teems with fun, but it is a nervous, emphatic fun, which instructs at the same time it amuses. Many truths are told us concerning our moral and intellectual waywardness, and many excellent admonitions quaintly suggested. The hit at the bizarre fashions of the day in the first sketch is neatly delivered, and the patent-minister and lecturer manufactory is characterized by an audacity which the reader can not help admiring. The experiences, nameless and terrible, odd and fantastic, of childhood, are vividly set forth in the study of that early period in our human probation. In these pencilings Mr. Perkins discovers

his kinship in the child-life with other men and women of his generation. "The Compensation Office" is the gem of the collection, and may be recommended to the perusal of society in general, and particularly to those disappointed or unhappy in their domestic relations, or in the vocations of their choice or necessity. The series closes with "My Forenoon with the Baby," which is packed full of mirth-provoking incident, and will please those mothers who are inclined to regard men nurses as "horrid bears."

READINGS AND RECITATIONS. A New and Short Collection of Articles in Prose and Verse, embracing Argument and Appeal, Farce and Humor, by the Foremost Temperance Advocates and Writers; suitable for use in Schools or Temperance Organizations, Reform Clubs, Lodges, etc., and for public and private readings. Edited by Miss L. Penney. Paper. Price, 25 cts. New York: The National Temperance Society and Publication House.

This collection, take it altogether, is an excellent one for the uses which are pretty fully set forth in the above title. As there are upward of a hundred selections, many of which are from the pens of eminent writers, the price is certainly very moderate.

ALCOHOL AND THE STATE. A Discussion of the Problem of Law as applied to the Liquor Traffic. By Robert C. Pitman, LL.D., Associate Justice Superior Court of Massachusetts. 12mo, cloth, pp. 406. Price, $1.50. New York National Temperance Society and Publication House.

It is certainly an encouraging fact for the consideration of all who are friendly to temperance reform, that the law, through many of its leading representatives, is becoming more and more interested in measures for the suppression of the promiscuous sale of alcoholic beverages. During the past two or three years, several books of high importance on the legal aspects of the temperance question have been published, and the appearance now of Judge Pitman's admirable treatise is indicative, we take it, of a growing demand for the solid discussion of the subject from the point of view of human right.

"Throughout this essay," the author says, "my purpose has been to keep close to the subject indicated by the title, to treat it in a calm and argumentative rather than in a rhetorical style, and to present the policy of Prohibition as not a mere corollary from personal abstinence, but as based upon the broadest grounds of statesmanship." The general tone of the book is in keeping with this statement; it is a calm, judicial view of the situation presented by alcoholism to-day. The data are drawn from the best sources, and those sources are fully named.

Judge Pitman divides his work into two parts: the first, distributed into ten chapters, discusses the direct influences of alcoholism upon society, in occasioning "Waste," the "Destruction of Home," the increase of pauperism, disease, and immorality. The second part discusses the legal aspects of the liquor traffic, in sixteen chapters, and covers a wide field, from "The Province of Law" to "Law as a Teacher" and "Enforcement." As an argument we consider this volume the most exhaustive and convincing of any that have been published on the subject, and we gladly commend its perusal to the reader in general, and to the active promoter of temperance reform in particular.

PUBLICATIONS RECEIVED.

THE OCTOBER NUMBER of the Magazine of American History (A. S. Barnes & Co., Publishers) is noteworthy. The leading article is an account of the Location of the National Capital at Washington. The biographical sketch, from the pen of the editor, is of Colonel Ebenezer Stevens, of the Con inental Army, who commanded the artillery of the Northern Department in the campaigns of 1776 and 1777, accompanied Lafayette in his Southern expedition in 1781 as Chief of Artillery, and was later at the siege of Yorktown. This sketch contains some new and curious details of the Boston Tea Party, in which Colonel Stevens was an actor. The department of Original Documents supplies a Bundle of Old Letters of Paul Richard, Mayor o. New York, of Robert and Richard Ray, New York merchants in 1758; a letter of a Son of Liberty to James Beekman and some interesting correspondence between Fulton, Madison, and Monroe upon the organization of a steam navy. To these are added the Journal of Charles Clinton, the founder of the great New York family of that name, of his voyage from Ireland to America in 1729. The Reprint is a translation from the Spanish of an interesting paper on the death of Diego Velasquez, the companion of Columbus. The Notes and Queries are full, and pleasant reading, and the notices of historical publications bring the record of this class of literature up to date.

THE PROPHYLACTIC TREATMENT of Placenta Prævia. By T. Gaillard Thomas, M.D., Professor of Obstetrics and Diseases of Women and Children, College of Physicians and Surgeons, New York. Reprinted from the *American Practitioner*.

MONTHLY WEATHER REVIEW FOR AUGUST. From which we obtain the information that during the month an unusually low range of barometer prevailed over the Atlantic and Gulf States; the temperature was excessive generally, and although there were many heavy local rains, the Middle States in general experienced a drought.

PROCEEDINGS AT THE TENTH ANNUAL MEETING of the Free Religious Association, held in Boston, May 31 and June 1, 1877. This bulky pamphlet contains addresses made by several eminent representatives of liberal religious thought; among them Wm. R. Alger, O. B. Frothingham, Wm. H. Channing, Rabbi Lasker, T. W. Higginson. Published by the Boston Free Religious Association.

FAMILY RECORDS; their Importance and Value. By William Frederic Holcombe, M.D. An Essay read before the New York Genealogical and Biographical Society, February 21, 1877.

THE CHRISTIAN INTELLIGENCER. Current numbers have come regularly to hand. We note an improvement in form and literary tone.

CIRCULAR OF COLORADO COLLEGE, at Colorado Springs. 1877–78.

OPENING OF THE PHRENOLOGICAL INSTITUTE.

The Autumn (1877) Session of the AMERICAN INSTITUTE OF PHRENOLOGY opened with appropriate exercises on the 6th of October.

Mrs. C. F. Wells, in behalf of the agents, bade the new students welcome to New York and the privileges of the institution, and reminded them that Phrenology is a science and its practice is an art, and that the main object of their coming here was to acquaint themselves with the art or practical application of Phrenology.

Mr. Austin, the instructor in Elocution, was then introduced and said :

In the course of instruction now inaugurated we come together, not as strangers, but as friends. We meet as the result of a line of thought and course of study that makes us companions and co-laborers. We come together in the spirit of a common fellowship ; in the interest of a common cause ; and I trust it will result in enlarging the field and augmenting the influence for a common good. You have gathered here from great distances to condense and crystallize into practical utility the knowledge you have imbibed of the laws and philosophy of our science, and we shall aim to so direct our efforts that you will all appreciate that each one of us in his special department has done his best to properly fit you for so important and useful a field of duty and labor ; and expect and believe that at the close of the session you will have reason to feel, that, without this course of instruction, you would be unable to assume the position to which you aspire.

It will be my duty to give you such rules and exercises in vocal culture as our limited time will allow, not with the expectation of perfecting you in the art of elocution, but in the hope of laying the foundation for *growth* to that end. Richard Grant White says : "Reading aloud is among the very best of educational disciplines, because a person can not read anything aloud *well*, with proper inflection and emphasis, without thoroughly understanding it "—and this is the art that makes the orator.

Expression should be as much a matter of education as the training of the mind. It is only secondary to the production of thought, and any course of education which discards the power of eloquence and professes without its aid to fully equip the mind, *cripples* its flight by withholding so strong a pinion.

The magic power of eloquence animates the earnest heart to high resolves and higher ambitions ; fires the soldier for conflict and to face death ; makes the culprit hide his face in horror from the distorted visage it reflects ; and breaks down the stern majesty of law with its tender pathos and subtle pleadings.

Some of the best thoughts and finest conceptions fall listless and lifeless for want of an effective delivery, while an otherwise ordinary speech, through the power and magnetism of a fine elocutionary effort, *rivets* attention and conveys lasting impressions ; and, as speakers, *you* will find that though you *have* your line of discourse well mapped out, and your ideas well drilled, you will fall far short in force of expression, in proper inflection and emphasis, without the aid this culture gives.

We bid you a hearty welcome and wish you a happy sojourn with us.

Mr. H. S. Drayton, instructor in Mental Philosophy and the History of Phrenology, in response to a call, said :

FRIENDS AND MEMBERS OF THE CLASS FOR THE AUTUMN OF 1877 :—I think it quite appropriate that there should be some formality in the opening of our sessions ; and there can be a form without much effort at seriousness. I take it that you who are present — those particularly who have come long distances—are actuated by a grave purpose. Being already acquainted somewhat with the fundamental principles of Phrenology, you have come to increase your knowledge, not only with regard to those principles in themselves, but especially with regard to their operation and adaptation in our active life. We claim—perhaps it is not necessary to make the assertion in this presence—that the principal object or aim of Phrenology as taught here is to give a knowledge of the selfhood ; first knowing ourself we can then proceed to consider those without. There can be no success in life —I care not in what department one may work— without a knowledge of the self-nature. How is it possible to adapt ourselves to any vocation without knowing our capabilities ? If you would teach others to understand themselves, you must instruct them from your own plane. You can have no standard of judgment with regard to others which will be sure—which will give a firm footing, other than that which proceeds from yourselves. I know that it is a common saying with people when remarks of a personal nature are made that are not altogether acceptable to them, that he who has made the remarks "judges others by himself," and they utter it in the spirit of reproach ; but I will not reproach a man for judging of others if I know that he has well-estimated himself beforehand ; for I know that he who well understands himself, will have a fair understanding of the world without.

Christianity is said by the theologians to deal with the "heart ;" that is the old designation of what we now understand as *spirit*. The good Book says that out of the heart proceed all kinds of expression—evil thoughts and good—confirming in advance this system of ours, which declares that man expresses in his outward manifestation motives and thoughts which rule within. Horace Mann was right when he said, "Phrenology is the handmaid of Christianity ;" for the very reason that Phrenology recognizes the inruling of motive, of sentiment, and that the expression of the man may be taken as a guide to the estimation of his mental status.

We, as Phrenologists, differ somewhat from the array of thinkers who appear to have the lead in modern metaphysics, and who are represented by such minds as Spencer. If you will look into their philosophy you will find it stated substantially that man is as he is by reason of— not his interior self—but of his environment ; the circumstances which surround him make him what he is ; and, therefore, if you would improve man's condition, you must improve his environment. Phrenology, however, says man is what he is by reason of himself, his inner nature, his inner life ; that man makes or mars his fortune for himself. I grant that circumstances have an influence—a tendency to mold and educate, but the man's motive, tendencies, individuality, are the motor principles in his life. Were we to attempt to apply the rule which those thinkers assert to the lives of many great men in the records of history, we would soon find that it would not suit. If it be circumstances, environment, which make men, would the world have known a Demosthenes, a Socrates, a Hadrian, a Swedenborg, a Galileo, a Luther, a Sterphenson, a Lincoln, an Edwards — that distinguished and living Scotch naturalist—who fought against circumstances during his childhood ?

Our surroundings may influence the mind ;

and yet we have surroundings sometimes with a mental state entirely different from that which would be suggested naturally by them. Do we not look at things through glasses which are colored by our mental state, be it hopeful, gloomy, or cheerful? Certainly each one of us views external conditions largely in accordance with our different views. Circumstances may suggest the coloring of thought, but the primary motive and the primary impulse is given by the man's essential character. Two men may be walking along a shore of the noble river which washes the western boundary of this city; one will see beauty and grandeur in it, the other will see utility—simply prosaic utility—and discuss its application for the purposes of commerce in a practical way; and the influence of the man who sees the beautiful may not be sufficient to work the practical man into an ecstasy of admiration. Hamlet is represented as learned, refined, noble, yet looking upon the world as disorderly and chaotic; but the great genius who created Hamlet saw beauty and adaptation everywhere governing in the world.

It was not my intention, however, to make more than a few simple remarks to you on this opening occasion, to the effect mainly that each one of those who will meet you in the character of instructors will be earnest and faithful in his department, and that when the session has come to its close, you will feel that your attendance here has been in most respects a benefit."

Mr. Nelson Sizer, instructor in Practical Phrenology, said among other things:

Thirty-eight years ago I was preparing to enter the phrenological field. I was studying the books by myself, and trying to make some drawings which would illustrate and represent the forms of heads. At that time Phrenology was not very much known—in fact, it was very little understood in this country. The Fowlers were lecturing, and the great Caldwell had taught some, but in those days railroads, telegraphs, and great newspapers were not in existence. Stage coaches carried people from Albany to Buffalo; they went through sometimes by daylight and sometimes not. Everything was localized; now everything is generalized.

When I commenced in this field there were but very few in this country trying to vindicate the subject publicly. You may count them all on the fingers of one hand. There were dear friends of Phrenology, such as John Pierpont, William Ellery Channing, Horace Mann, Dr. Boardman, Amos Dean, of Albany, late deceased. There were strong thinkers who studied Phrenology as a science, but not as an art. In that day there were very few men who understood Phrenology tolerably well or made any attempt at applying it practically. They would read it as a metaphysical science; they would study the nature of each faculty as laid down by the immortal Gall and Spurzheim, and by their no less immortal successors, the Combes and Dr. Caldwell; and they would see in it a science of metaphysics far surpassing that which they had ever conceived before; but beyond that they did not try to go. They did not undertake to apply Phrenology very much to the living head.

Practical Phrenology was introduced into the world largely by the Fowlers. In this Yankee world of ours we want a handle on both sides of the jug; we want everything to be practical. The question comes up, What is it good for? How can we use it? And therefore when the Fowlers began to study Phrenology they said: We must apply this. We must examine the heads of people. And how did they apply it? They would say to an audience, You may blindfold one of us, and he will make an examination while the other examiner is in another room, or even across the street, watched by a committee chosen for the purpose, that no collusion may exist between us. So, the first having finished his examination, the other would also make an examination blindfolded, that the audience might compare or criticise the two statements. I have done that with the Messrs. Fowler myself.

Of course, there has been a great deal of quackery practiced by persons pretending to be phrenologists, as in what new thought or discovery has there not been? Gumps undertake to preach the Gospel once in a while; selfish, ignorant men undertake to practice the healing art. Anybody can be an editor, or try to be. Sometimes one succeeds. In this great country anybody may undertake to do what he please, and if he succeed, he becomes master of the situation, so far as the situation extends. We demand of men to prove what they profess.

Now, wherein does this great subject of ours differ from others in regard to mind? The subject of mind has been the constant study of the greatest thinkers in every age since the dawn of civilization. Men have studied to know what is man, and what is in man, and they have closed their eyes and tried to introspect themselves. A great metaphysical writer will sit down and write very clearly about the way he feels himself; and he will infer as well as he can by examination of self-consciousness what he is, and so write a system of mental philosophy for other people to accept. Now, such a man can not write in that way a system for any other man, for they are not alike. No one of you could write a system of philosophy that would not differ from that of every other man or woman here. Why, you can not walk across the room and make such steps as any other person can walk in easily, naturally.

A metaphysician may write a system of mental philosophy, and speak about reason, judgment, imagination, will, understanding, etc., and call his work mental science. But in fact the metaphysicians differ almost as much as theologians differ. One man of note said that conscience, or that which we call conscience, grows out of the love of praise. Now, that man had large Approbativeness, and he was thoroughly honest in saying that which he felt, viz., When I have done wrong, what is my sense of remorse and sorrow? It is, What will the people say? What will the world think? Now, others differently constituted, would laugh at a man who felt that way when he had done wrong. Such a man has Conscientiousness less developed than Approbativeness, and Approbativeness forms the basis of his idea of conscience. Another man thinks the fear of punishment is the basis of moral duty. Once in a while we find a man who says man does right without the fear of punishment or hope of reward, or anything extraneous; but does right because it is right. That man has true conscience, and he will answer very well as a metaphysician on the subject of conscience; but he might not on other subjects. Phrenology is a system of induction—from facts—and in the course of this series of lectures and lessons we will show you how every faculty was discovered. Dr. Gall was one of the most honest of observers. He did not allow himself to decide any question with regard to an organ until he had made at least a thousand observations on the subject.

I want to say to you here, and now for the first time, but not for the last, the brain is the man just as much as the hub of the wheel is the heart of the wheel; and everything that you are, in power of hand, in sensitiveness of hearing, or clearness of vision, etc., you are because of your brain organization. Everything that belongs to man is the servant of this central organ, the brain, and there is where the soul and mind reside; there is where the man is.

—A Set of TEA-SPOONS, FORKS, KNIVES, FRUIT or CAKE BASKET, NAPKIN RINGS, Etc.? We offer REED & BARTON'S celebrated SILVER-PLATED WARE, as Premiums for Subscribers to

THE PHRENOLOGICAL JOURNAL,

on the following very liberal terms. All Standard Plate and fully Warranted.

Gem Pattern.
New Style, with Cutting Edges.

NAME OF ARTICLES.	NO. OF SUBSCRIBERS REQUIRED At $2.00.
One dozen Tea-Spoons,	5
One-half dozen Table-Spoons,	5
One dozen Dessert-Spoons,	8
One dozen Table-Spoons,	8
One dozen Table Forks (see cut),	9
One-half doz. Solid Steel, Silver-Plated Knives	5
One-half dozen Napkin Rings (see cut),	5
Either a Castor or Butter Dish,	6
Elegant Fruit and Cake Basket (illust'd above).	7

Set about it in Earnest and it will be found not difficult to obtain either of the above premiums by a few hours work. Send 20 cents for Agent's Outfit, Specimen numbers, circulars, blanks, etc.

Address *S. R. WELLS & Co., Publishers, 737 Broadway, N. Y.*

AN IMPORTANT ANNOUNCEMENT.

Price Reduced for 1878.

In consideration of the continued hard times, and wishing to increase a knowledge of and interest in Phrenology and Health Reform, it has been deemed best to reduce the subscription price of

The Phrenological Journal

FROM $3.00 TO $2.00 A YEAR.

The size of The Journal must of necessity be reduced somewhat, but this change will not be in proportion to the reduction in price, while the quality of reading-matter, scientific and miscellaneous, will be more than maintained. Each of the several important departments will be retained, and no expense spared to make The Journal the best and most useful publication for general circulation.

This REDUCED PRICE will place it within the reach of all, and will result in a greatly increased list of subscribers; and, as an incentive for immediate subscriptions for 1878, we offer

3 Months Free to New Subscribers for 1878.

That is, all subscriptions received now, with the new subscription price, will be entered for the October, November, and December numbers of this year FREE; thus giving The Journal in the $3.00 form THREE MONTHS FREE.

In order to introduce The Journal more widely for 1878, to new readers, and believing that it needs only to be seen to be appreciated, it is decided to offer it to new subscribers for three months

ON TRIAL FOR 25 CENTS.

Names should be sent in at once, and the numbers of The Journal will be sent regularly.

AGENTS WANTED to canvass for The Journal. Liberal Cash Commissions given, or choice from liberal Premiums; and at these reduced rates large lists of names should be obtained by every canvasser.

Send for Terms, and address all orders to

THE PHRENOLOGICAL JOURNAL AND LIFE ILLUSTRATED.

VOL. 65. 1877.

NUMBER 6.] *December, 1877.* [WHOLE No. 468.

RUSSELL T. TRALL, M.D.,

THE EMINENT HYGIENIC LEADER.

IN the November number the death of this eminent and most active of American advocates of hygienic medication was announced. As the intelligence did not

reach us before we were closing the JOURNAL forms for the press, it was necessary to defer such an account as might properly sketch his career until the present number. A dozen years or so ago a delineation of his phrenological character was published, which showed him to possess the following qualities and traits:

In brain and temperamental constitution he was a superior man, intensely active as a thinker and worker, thoroughgoing and positive in all that he undertook. As indicated by the portrait, he had a large and prominent forehead, the organs of Causality and Comparison predominating; but the perceptive faculties, as a class, were larger than they seem, on account of the fullness of the upper part.

He had very large Firmness, Cautiousness, Conscientiousness, and Combativeness—the latter being exceedingly prominent and active. We account for this on the ground that Dr. Trall had quite early in life engaged in the temperance cause, and subsequently added to his militancy in that the controversies in which he found himself involved for the maintenance of his opinions in physiology and hygiene. He has been, as is well known to most of our readers, the chief promulgator of the new school of medical practice based on hygienic principles.

He had but moderate Veneration, hence his comparatively little deference for old theories or opinions in religion and science, and his Secretiveness being moderate or small, and Approbativeness, Firmness, and Conscientiousness large, with an original, philosophical, and experimental intellect, he was disposed to take strong and radical grounds on all questions which interested him. Instead of adopting the opinions of others, or resting on theories which may be true or may be false, he looked at once to original sources to discover the causes of things.

He had that degree of integrity, truthfulness, and tenacity which would hold him to his convictions though burning at the stake. There was no yielding in his disposition. Intellect to discover, and Caution to make him careful to be right, and Conscientiousness to fortify and hold him to it, made it next to impossible for him to deny or forswear the truth. The religion of such a man is made up chiefly of Conscientiousness, giving the sense of justice, the appreciation of duty and obligation, and Benevolence, which imparts kindness, sympathy, and generosity.

His Constructiveness was well developed; it gave him fondness for mechanism and enabled him to appreciate inventions, machinery, architecture, and to plan and contrive. He abounded in suggestions and projects.

He had a full degree of Ideality, but more Sublimity, and was not wanting in a taste for art and poetry. Mirthfulness was large, which, combining with Combativeness and a quick, active intellect, rendered him very sarcastic and cutting in his remarks and criticisms whenever disposed to exercise the tongue or pen of the critic and satirist.

In the use of language, however, he exhibited more fluency through the pen; but had he given more attention to public speaking, he would doubtless have excelled.

Socially, the brain was well developed; in love for the opposite sex, for the young, for friends, for home, he was not deficient; but such was his devotion to the objects of his professional calling that he appeared less social and domestic than he really was.

His chief faults grew out of his moderate Acquisitiveness, for he failed to appreciate the true value of property; his small Secretiveness and large Combativeness, which

rendered him blunt to friends, and to his opponents unpleasantly candid.

His indifference to the opinions of others often led him into controversies and embarrassments which a little considerate deference would have avoided. But there was scarcely any of the elements of compromise in his organization, and his moderate Veneration and Spirituality were insufficient to tone down his rigid estimate of justice and propriety and his severe requirement of proof before he would yield assent to any proposition which did not at first make a favorable impression.

RUSSELL THACHER TRALL was born at Vernon, Tolland County, Conn., August 5, 1812. His parents removed to Western New York, then almost a wilderness, while he was an infant, and where he was designed for the life of a farmer. His opportunities for education were exceedingly meager, and were wholly confined to the District School. Before he had fairly emerged from boyhood he lost his health, and receiving, as he believed, nothing but injury from the treatment of all the physicians whom he consulted, and being dissatisfied with their explanations of his malady, and their talk about the remedies proposed, he determined to investigate the subject for himself. His father was astonished and the whole family circle surprised on being informed that he had "chosen a profession" and had entered the office of the village physician as a medical student. Some opposition was manifested by the "constituted authorities" to the boy's action, but when it was found that he had "made up" his mind, the point was conceded; a yoke of oxen was made over to the doctor in payment for two years' tuition, after which the medical aspirant was to work his way in bleeding, pulling teeth, visiting unimportant patients, and otherwise assisting the "old doctor." In a day or two thereafter the subject of this memoir found himself peacefully installed among bones, books, and drugs. He had, however, no definite idea of ever becoming a physician. His health was lost. If he did not regain it he was useless. He determined to sacrifice all to that primary consideration, and let the future take care of itself. He pursued his studies diligently for three years without finding the health he sought, and then, after attending courses of lectures at Castleton, Vt., and Albany, N. Y., he was graduated, and practiced several years in accordance with the theories into which he had been educated. Having studied medicine as, perhaps, very few other human beings have, with no reference to acquiring a profitable trade or business, but solely with the view to self-preservation, he was almost of necessity a close and critical scholar and an impartial and unprejudiced truth-seeker. Before he had finished his course of studies he began seriously to think that a majority of medical doctrines were, as he styled them himself, "the incoherent expressions of incoherent ideas;" that many of the rules of practice as taught in the standard text-books were entirely erroneous, and that many of the remedies in general use were not only injurious, but dangerous. Before, therefore, he had taken the degree of M.D., he had become very skeptical with regard to much of the so-called Medical Science of the world. Having no love for nor interest in any system but the true one, and being determined to satisfy himself, if possible, what was true, he investigated theoretically and tested experimentally the Homeopathic, Eclectic, and Physio-Medical systems, his observations and experience continually leading him away from all faith in drug medicines of any kind.

In 1840 he came to New York, where he had enlarged opportunities for pursuing his researches, and soon became fully satisfied in his own mind that the whole system of drug-medication was false in philosophy and absurd in science, "in opposition to nature and contrary to common sense," and that the only true remedial agents were those materials and influences which possessed *normal* relations to the vital organism—air, light, water, food, temperature, exercise and rest, sleep, emotional influences, electricity, etc.

About the year 1844 he opened in New

York city a "Water-Cure," the first undertaken in the United States. His first patients were a set of desperate cases from the Broadway Hospital, all of whom recovered under his management. From that time Dr. Trall did not administer a grain of drug-medicine, or alcoholic stimulants of any kind.

In 1847 he started the New York Hygienic Institute in Laight Street, New York, and continued to direct it until 1864, when he disposed of his interest and went to Minneapolis, Minn., where he had organized a Cure on a large scale. This enterprise, however, did not succeed in accordance with his expectations, and he returned to New York in 1866, and shortly afterward opened the establishment at Florence Heights, New Jersey.

In 1852 Dr. Trall founded a "Hydropathic and Physiological School," which was chartered by the Legislature in 1857 under the name of the "New York Hygeio-Therapeutic College," and authorized to confer the degree of M.D. In this college ladies and gentlemen were admitted on precisely equal terms.

In 1862 he went to Europe to attend the International Temperance Convention. In this meeting of reformers he took a prominent part, discussing with his characteristic vigor the physiological aspects of questions relating to the use of alcohol as a beverage and as a medicine.

Notwithstanding extensive and exacting professional business, Dr. Trall found time to write many valuable books and pamphlets, besides editing and contributing to several periodicals. The catalogue of his published books includes more than twenty-five volumes, embracing the subjects of Physiology, Hydropathy, Hygiene, Vegetarianism, Temperance, etc. The most noted and perhaps the most valuable of these is his "Hydropathic Encyclopedia," an elaborate work of nearly one thousand pages, which not only treats of the theory and practice of Hydropathy, but also considers the philosophy and treatment of diseases advanced by the older schools of medicine. The circulation of this work has exceeded forty thousand copies.

"The Family Gymnasium," another popular treatise, was written to meet the want of the people for a text-book which would advise them with respect to proper methods of physical exercise.

"The Hydropathic Cook-Book" was a natural outcome of the practice of his system of dietetics in the hygienic establishments which he started. It is not only a compilation of recipes, but also a scientific treatise on human foods.

"Popular Physiology" is a brief but thorough treatise on the subject of human physiology, adapted to the use of the reader and to schools as a text-book.

One of Dr. Trall's later works is "Digestion and Dyspepsia," which has found a wide circulation. Although a small volume, it contains a full description of the different causes and forms of dyspepsia, and supplies advice with reference to their cure by dietetic means.

"The Mother's Hygienic Hand-book" is, as its name implies, a manual for the use of women in the home treatment of the disorders peculiar to themselves, and in the management of children. It is an exceedingly valuable work, and has saved many lives and prevented more suffering and disease than could be easily related.

Besides these, his "Alcoholic Controversy," "True Healing Art," "Uterine Diseases," "Tobacco Using," "Water-Cure for the Million," and "The Temperance Platform" are worthy of passing mention.

For several years previous to his death Dr. Trall had been engaged upon a work which was intended to embody his views and many years' experience as a medicist, and it is gratifying for us to be able to say in answer to recent inquiries, that he had very nearly completed it, so that its publication may be expected at no very distant day. In the palmy days of the Washingtonian Movement he edited the *New York Organ*, then the leading temperance weekly of the country, and for two years he was one of the assistant editors of the weekly *Life Illustrated*, at one time published by this house. For more than fifteen years he had charge of the editorial department of the *Water-Cure Journal*, which was pub-

lished by Fowlers & Wells and was afterward called *The Hygienic Teacher;* later, when it became his own, *The Herald of Health.*

On assuming charge of the "Hygeian Home" at Florence Heights, Dr. Trall gave attention more strictly to the treatment of his patients and to the instruction of the classes in the Hygeio-Therapeutic College, the sessions of which were held subsequently to 1867 at Florence.

As a writer, he wielded a ready pen, and wrote in a crisp, condensed style, which proclaimed the man of learning and experience. It may be said with safety, that for clearness and vigor of thought, facility of expression, and command of data relating to his subject, he was unsurpassed by any other writer in the ranks of contemporary medicists. His manuscript was singularly free from alterations or erasures, and he was a friend to the printer, in that he rarely found it necessary to make changes in his proof-sheets.

His death, although at an age when men are commonly deemed in the decline of life, may excite comment reflecting upon the system of which he was so powerful an advocate. It is, therefore, proper that we should ask the reader to consider the life of the man, and judge whether or not his career of sixty-five years is a strong testimonial in favor of his theory and practice.

He has been an incessant, enthusiastic worker, violating indeed many of the rules of hygiene which he himself insisted upon as essential to be observed if one would have good health. It was a common habit of his to work far into the night to accomplish what he deemed necessary, and in this way his native stock of vitality (never great) was largely drawn upon; besides, the weakest point in his constitution was that which was impaired by disease in his early years. A few days before his death, while in an exhausted condition from overwork, he contracted a severe cold. He was not living as an inmate of the Hygeian Home at Florence, but in a cottage detached from the ground, with his son, they having their meals sent to them or going to the regular dining hall. When he felt the influence of the cold, he took a wet-sheet pack, supposing this would be sufficient treatment, but it should have been followed up, as it was not. His judgment was greatly warped by his physical condition, and when his son desired to render him assistance and proper care, he declined to be cared for. His instinct was to be let alone, and his son, a young man absolutely without experience, having been used to yielding to his father's judgment in all things, yielded now to his father's request to be let alone, supposing that rest was what he needed and that he would soon recover. The atmosphere in that part of the State, as well as in many other parts of the country, has been during the past season much tainted with the malarial influences which produce fever, and in his debilitated condition Dr. Trall was a susceptible subject for it. Those familiar with the nature of malarial disorder know of the depressing influence it has on the mind. This soon took hold of the doctor and he became rapidly worse, still urging to be left alone, until the young man, becoming alarmed, called on friends for counsel and sent for the doctors. But it was too late; Dr. Trall was already dying, and he passed quietly away as though asleep. He had often said of late that he had lived his allotted time, and now it could be no fault of hygiene if he died. Still he hoped to live many years, feeling that his work was hardly finished; but as stated before, what he had done would have exhausted the life of a much stronger person, and the accomplishments of his career will wield an influence through coming generations.

THE GOVERNMENT LIBRARY.—The entire number of volumes in the library of Congress is now about 315,000. This library is especially rich in periodicals, nearly all the English and American reviews and magazines being taken, with many of the most valuable in foreign languages. The files of newspapers alone now exceed 5,000 bound volumes. The copyright business of the library, notwithstanding the depressed condition of the book trade, shows more entries than last year, about 11,000

copyrights having been granted since the 1st of January, 1877. An increasingly large number of periodicals, musical compositions, photographs, engravings, and maps are protected by copyright. The library grows so rapidly, through its various collections, aided by purchase, exchange with foreign governments, the deposits of National and State documents, additions from the Smithsonian Institute, and the operation of the copyright law, that the necessity of a new building, constructed especially for its accommodation and future growth, has long been conceded. It is believed that Congress will, at the coming session, provide for the better protection and safety of this great and invaluable library.

FULL-ORBED MANHOOD.

[AN extract from the Rev. Joseph Cook's lecture on "Certainties in Religion" delivered before the Chautauqua Assembly:]

"WHAT a frictionless action is the soul of a full-orbed man! Why do I say full-orbed? Because this loom might turn against the very plan of it if you were to take off half a dozen wheels. The young man who has crushed out fifty or eighty of the noblest instincts of his nature by dissipation—he is not only a dissipated man, but he is a dizzy-pated man; he is not a fair specimen of human nature. I will not take him to find out how this human machine may be made to operate harmoniously upon itself, for several of the wheels are gone. Perhaps I could turn him the wrong way and give no distress to his faculties.

"Well, but you say this is a very unfair procedure. It is a scientific procedure, for if I go to Ann Arbor, or the University of New York, and ask some great professor what the lily of the valley is, or what the plant we call maize is, he will not show me a stunted specimen. If I carry to him a lily of the valley or a stalk of maize, he will want a specimen that grew in good soil, and that was well watered, and that showed all the powers of the plant. If I present to him the plant which rustles over so many hundred square miles on the prairies yonder, he will ask: 'Did the maize come from France, where it produces forty to one; or from Illinois, where it produces eighty to one; or from Mexico, where it produces a hundred and fifty to one?' He will not take the maize to put into his cabinet unless it is a full-grown specimen, and he is perfectly scientific in that procedure; and so with the lily of the valley—he will not have it from any stunted soil, but he tells me that I must make up a picture of it if I can not get a perfect specimen. Some specimens are good, and I will picture the best in a number of specimens until I have from several specimens a perfect idea of what that plant can do. When I have done this, I carry that picture to Prof. Agassiz, or Prof. Dana, and he will say: 'That is a lily of the valley that I will show to the world as a specimen of what is natural in that plant.'

"Just so I claim that if I have to follow the scientific method in ascertaining what is natural to human nature, I must take full-grown specimens, and if I can not find in any one man or woman all the growth of all the faculties, I will take the best history has shown here, and the best it has shown there, and make up my ideal of man as Agassiz does his ideal of the lily of the valley. What is natural to man? Let us answer that question by an unflinching application of the scientific method. Let us for a moment build up a man by that stern style of dissection which the student of merely physical science applies to the plant. We shall find ourselves confronted at once with a sense of our own fragmentary growth. I have a right, just as in the case of the lily of the valley, to take the best of many specimens.

"Put together Phocion for Greece, and Hampden for England, and Washington and your Lincoln for America, as representatives of lofty justice in men. Take your Aristotle and Bacon, your Kant and Hamilton and Edwards, as specimens of

analytical power. Take your Isaiahs and Fénelons and Bossuets, your Miltons and your Jeremy Taylors, as illustrations of the height which men may attain in the spiritual imagination and insight. Take your Napoleons, your Hannibals, your Cæsars, for executive strength. Put into those full-orbed men the consciences of the martyrs and the apostles and the prophets. And now, having built up the loftiest zones of human nature according to the scientific method, I will not diverge from the stern demands of science: I will put into the lower zones of man's nature the very best growth you have seen there. For after Isaiah and Plato, after the prophets and apostles, after the Cæsars and Napoleons, after the Kants and the Hamiltons have been put into the upper ranges, I can bear to put into the lower, as added basilar strength, the Caligulas and the Neros and the Domitians and the Vespasians. It will only give steeds to these riders to put the best growth of the basilar faculties beneath the best growth of the coronal. It is good for a man to have a tempest in the lower half of his face if he has a hurricane in the upper half.

"Now, with that thought of a full-orbed man before you, ask whether nature made up thus can stoop to the gutter, can be at peace while uttering the words 'I will not' defiantly to the still small voice that says 'I ought;' can harmonize itself with the environment which faculty gives to faculty when it will not do what it knows it ought to do, or what the nature of things requires? Is it in such a full-orbed specimen of human nature to act crookedly or to drop down to vice? There is a rule in the United States that no one State can declare war or make peace without the consent of all the other States. Massachusetts and South Carolina have no right, under the Constitution, to fall into war or to declare peace unless the Union gives its consent. Now, just that is the law of this republic of faculties, and is the law of this full-orbed nature which I have sketched, and of which we have at best only a sketch, for a man must be a full-orbed nature in order to appreciate one of that nature. In man's nature there is a law that there must not be any secession. South Carolina must not go out of the Union. There is not a vice that can get a vote of the Union on its own side. I claim there is not a single action in human nature known as a vice that is not a secessionist in the constitution of man's nature. Now, if you please, it is getting to be a stern last morning with all philosophy that has vice, if these things can be demonstrated to all men. We know we are made on a plan, and the soul ought to act frictionlessly, and of course, when men take a full-orbed soul as a specimen of what is natural, and we know that every vice is a secessionist, why, we know then *scientifically* there is a best way to live, and if there is a best way to live, we know scientifically that it is best to live the best way.

"You think nothing can be proved outside of the Bible? Why, all these propositions I hold would be true even if there had been given us no revelation. I hold this is incontrovertible."

COLORED PEOPLE.

CONSIDERED SCIENTIFICALLY AND SOCIALLY.

[THEIR candidate was Scipio Africanus (colored), a shrewd fellow, and a zealous partisan.—*South Side Gazette.*]

OUR fellow citizens of African descent seem to have a prejudice against the appellation, negro. Perhaps this is because some white people, who know better, and ought to *do* better, are accustomed to spell it with two *g's* and pronounce it with an offensive intonation. As the word simply means black, however, it is at least appropriate, and should not be considered any more a term of reproach than white or red. The objection to the word "colored" as a designation for the black race lies in the fact that it has, in its ethnological applica-

tion, other meanings, so that its use is liable to lead to confusion. In fact, it is often applied, even here in the South, to persons of mixed Caucasian and negro blood, to contradistinguish them from the pure blacks. But I am not disposed to be hypercritical, and simply desire to explain that I use the term "colored" in the heading of this article out of respect for what I consider an unwise sensitiveness on the part of the people who assume it, and that I include under it all who have sufficient African blood in their veins to show it in their complexions, or by means of any other external characteristics.

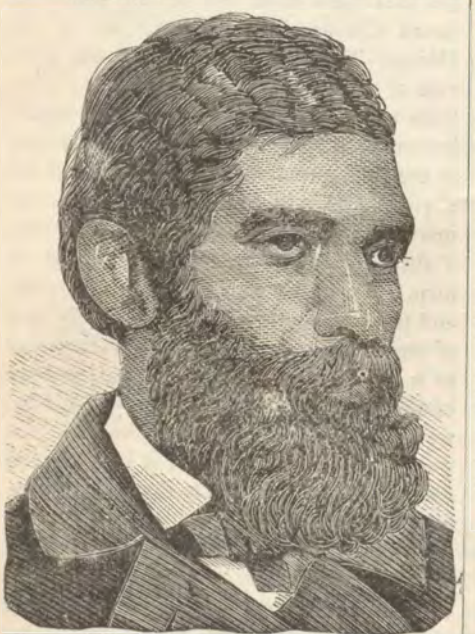

Fig. 1.—An Educated Mulatto.

If the "negro question" could be separated entirely from party politics, and from local prejudices and sentimental prepossessions, and be discussed on purely scientific grounds, and in the light of phrenology and physiology, there would be little difficulty in reaching some satisfactory conclusions.

The status of nations and of races, as well as of individuals, depends upon organization—upon the size, quality, and shape of the brain, in connection with the constitutional condition or temperament of the body; and these are susceptible of being ascertained by careful observation, examination, and measurement. The cranium, taking into account the varying thickness of the bone (readily determined by external signs), is the measure of the size of the cerebral mass, and the indicator of the

Fig. 2.—Negro Skull. Top-view.

relative development of its different parts or organs. Its organic quality, and the temperamental conditions of the physical system, as a whole, which greatly affect its action, have also their outward indications, easily distinguished by the well-instructed physiologist. What, then, is to prevent us from subjecting our colored friends to the tests which we have found trustworthy when applied to ourselves? If the cranium of a Cæsar, a Napoleon, or a Webster re-

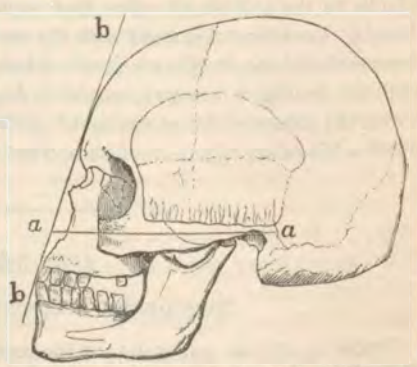

Fig. 3.—Negro Skull. Side-view.

veals to us the secret of the wonderful power of these intellectual giants, may not the cerebral encasements of Scip, Wash, and Jeff (colored) be read in the same way, and made to tell why the latter are

only "field hands" still, in spite of freedom, suffrage, and the spelling-book?

Having spent no inconsiderable part of a life-time among the negroes of the South, knowing them both as slaves and as freedmen, and being accustomed to study man and society in the light of phrenology and physiology, I feel justified in asking to be heard on this subject. I am unconscious of any prejudice or prepossession which could warp my judgment, and am sure that I have no partisan bias.

What, then, are the characteristics, physical, mental, and moral, of the colored people of the Southern States of the American Republic as we find them to-day, after a few generations of slavery, and a decade of freedom and political equality, in close contact with Caucasian civilization?

First, then, in those peculiarities which distinguish the Black, Tropical, or Woolly-headed race from all others. The negro of the Carolinian plantations does not differ materially from the negro as the pyramid builders of Egypt knew and figured him, more than three thousand years ago, as the accompanying drawing of a negro head, made in the reign of Rameses III., thirteen centuries before Christ, will show. With a little improvement in the drawing, the picture might pass for the portrait of one of the sable legislators of South Carolina or Florida. I am far from saying or believing that there has been no improvement resulting from contact with the white race and its advanced civilization, even under all the disadvantages of bondage, and an enforced ignorance of book-knowledge. The point I desire to make is, that racial distinctions are at least comparatively permanent. The negro may improve, but the improvement is in the line of his racial tendencies—he improves as a negro, and not by approximating the Caucasian. The race may reach a high civilization, but, except so far as it is swallowed up and made a part of an European or American civilization, it will be a very different thing from the civilization of the Caucasian race.

In the second place, the negroes of the United States are the descendants of individuals taken from many different African tribes, and therefore, perhaps, more truly represent the race as a whole, than the people of any one tribe in Africa itself could do.

The stature of the negro, as we know him here, is medium and more uniform than

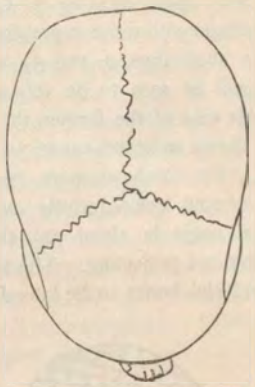

Fig. 4.—Caucasian Skull. Top-view.

that of the Caucasians of this country, very few individuals being remarkable for either tallness or the reverse. Their figures are generally symmetrical, except that, compared with the Caucasians, the humerus is a little shorter, the forearm longer, the shin bones slightly bent forward, and the calves placed high up. Their gait is erect and free, but except in young persons seldom graceful.

The osseous system is strongly developed, the bones being large and heavy, and their

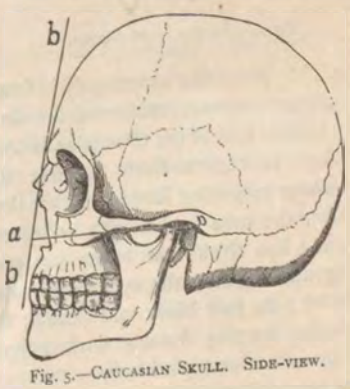

Fig. 5.—Caucasian Skull. Side-view.

articulations prominent, the apophyses being fitted to receive broad insertions of the muscles. The skull is coarse and thick, the dome being particularly solid, so that common negroes sometimes fight by butting

with the head, like goats, and with no more serious consequences.

In examining the negro cranium, the first thing that strikes us as peculiar is its relative length. This is equally apparent whether it be viewed from the side, as in fig. 2, or from above, as in fig. 3. Compare these drawings with those representing the Caucasian skull (figs. 4 and 5), and the contrast will be seen to be very striking. In the side view of the former, the frontal region is shown to be less capacious than in the latter, the forehead more retreating, and the occiput comparatively more full. The facial angle is about 70°, the jaws being heavy and projecting. The top view shows the facial bones to be laterally compressed, but projecting enormously in front. The average internal capacity of the skull is 82.25, while that of the Caucasian is 93.5. The face is comparatively narrow, the cheek bones projecting forward, rather than laterally; the nose is flat, with wide nostrils; the lips thick; the lower jaw protruding and angular; the eyes deep-seated and black; the hair black and woolly; the complexion varying from a dark copper color to an intense sepia black.

Fig. 6.—An Egyptian Negro.

The temperament of the plantation negro is almost invariably Motive. This is the prevailing temperament of the race in its savage condition, and the labors of the field, to which the women as well as the men were subjected in bondage, were well calculated to perpetuate and intensify it. In cities and towns, among those who have for generations been house servants, and have led a comparatively easy life, while living on "the fat of the land," the Vital temperament is not uncommon, especially in the women. Of the Mental temperament, I have seen few, if any, good examples among the pure blacks. A few generations under the *régime* of free schools and the responsibilities and opportunities of citizenship will, no doubt, develop it, and improve the size, form, and quality of the brain.

Such as I have described him is the colored freeman of the South, in his external physical aspects. What are the mental characteristics of which his configuration and temperamental conditions are the outgrowth and signs?

The prevailing bilious-motive temperament gives the negro not only the physical strength, hardiness, and toughness of fiber essential to a life of active labor, but it also imparts to the mental organization that persistence in manifestation—that capacity for patient endurance and continuous effort which enables him to cheerfully submit, when necessary, to days, weeks, and months of monotonous labor. The negro is continually accused of laziness. He is not lazier than the Caucasian who was once his master. From temperament he is slow, and it requires the stimulus of interest, or some external excitement, to arouse him; but when there is the necessity for it, he works with a will and with a perseverance for which he has hitherto got little credit.

On another point connected with temperament the colored people are strangely misunderstood. While supposed to manifest in the highest degree the sloth and indolence which are naturally associated with the lymphatic constitution (an abnormal condition of the vital temperament seldom found in the negro), they are generally described as being exceedingly volatile, buoyant, and jovial, as well as improvident, and careless of the future, traits that belong to the sanguine constitution, which is not commonly predominant in them. The truth is, the general deportment of the colored popula-

tion of the South is grave and serious, rather than light and mirthful, and there is far more pathos than jollity in their lives; even their music, so far as it is original with them, is always in the minor key.

Visitors to the South, particularly during the existence of slavery, saw the negro mainly in his hours of relaxation and recreation. His "corn shucking" frolics and Christmas merry-makings were the sharp reactions against the monotonous drudgery of his lot. No wonder the merriment was sometimes wild and boisterous, and that he danced and sang with more liveliness than he was accustomed to manifest in the cotton field. He can still be madly hilarious, under excitement, but the tendency now is to work off all surplus animal spirits through more serious exercises.

If the colored people engage in no grand enterprises, and make few, if any, organized efforts to improve their condition, it is not from any temperamental levity or fickleness, but because their foreheads are too low and narrow—in other words, because their intellects lack the depth and comprehensiveness required in movements of broad scope and affecting numerous interests.

Intellectually, the negro is observing, imitative, and docile; but his reasoning powers being imperfectly developed and in a half dormant condition, he has little ability to classify the individual facts of which he readily acquires a knowledge, or to comprehend the general principles which underlie them; therefore, while simple ideas are received with the greatest facility, those of a complex character only confuse him.

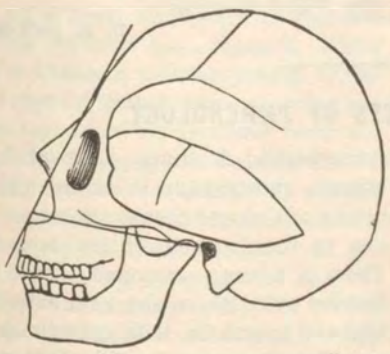

Fig. 7.

Fig. 8.

FACIAL ANGLE.

Dancing is dying out among the negroes, and their singing is almost exclusively confined to "psalm tunes." Religious meetings, "wakes," or watchings with the dead, in which the whole night is spent in psalm-singing and prayer, funeral processions, picnics, barbecues, and political gatherings have taken the place of balls and other more frivolous amusements.

The improvidence and carelessness of the future which characterize the freedmen are partly the result of climatic conditions, which affect all southern peoples in the same way, and partly due to their "previous condition of servitude," in which there was no occasion to give any thought to the morrow, which of course affected more or less permanently their characters.

His power of expression is wonderful, and is apt to outrun both fact and thought. His ideas never clog his speech. In his public harangues there is a steady and rapid flow of language, fervid and sonorous, sometimes almost eloquent, but oftener grandiloquent and grotesque. All negroes are fond of big, high-sounding words, and in conversation never use a short and simple Anglo-Saxon term when they can make a polysyllabic Latinism do service, and it matters little whether they fully understand its meaning or not. With a higher mental development and a better stock of facts and thoughts, this fluency and love of imaginative, ornate, and sonorous speech, together with the fervor and passion natural to his warm Southern blood, when quicken-

ed by excitement, may make the negro the natural orator of the future.

Rhyme and rhythm seem to have a charm for the negroes, and in their verses, sense is generally entirely secondary, as in the following fragment of a song:

Give this nigger
Chorus—Corn bread, corn bread!
Coon in the hollow
Cho.—Tree him, tree him!
'Possum in the 'simmon tree
Cho.—See him, see him!

And so on, with endless repetitions. Or as in this still more absurd jumble:

Solo—Obadiah
Chorus—Jumped in the fire:
Solo—Fire too hot,
Cho.—Jumped in the pot;
Solo—Pot too black,
Cho.—Jumped in the crack;
Solo—Crack too high,
Cho.—Jumped in the sky;
Solo—Sky too blue,
Cho.—Jumped in a canoe;
Solo—Pond too deep,
Cho.—Jumped in the creek, etc., etc.

till at last he "jumped in the cotton," when

Solo—Cotton so white,
Cho.—He stayed thar all night.

I can not refrain from giving one more example of this subordination of sense to sound. Walking one day in Charleston, in a street mostly inhabited by colored people, I met two negro boys singing as follows, with, so far as I continued within ear-shot of them, never-ending reiterations:

1st Boy—I know somebody what won't tell;
2d Boy—You go to heaben on a cocoa-nut shell!

I wondered (and I still wonder) if there might be, in the convolutions of the negro brain, a faculty lacked by us, by means of which he may discover an occult sense and a logical sequence where there seems to us only jargon and jingle!

D. H. JACQUES.

THE SCIENTIFIC ASPECTS OF PHRENOLOGY.

IN view of the controversy just now waging between Phrenology and its reviewers, and of the special aspect that the argument has taken, judging from the articles entitled "Reviewers' Persistence in Error," in the August and September numbers of the PHRENOLOGICAL JOURNAL, it is, perhaps, admissible for a comparative anatomist to contribute to the literature of the question a running review of the anatomical and physiological data upon which Phrenology rests. I enter upon this task with the greater pleasure, because, although the term *Phrenology* appears to me to be a very objectionable one, there is, I apprehend, very little difference among comparative anatomists as to the method of investigation founded by Gall and Spurzheim being the only really inductive method of psychological research, or as to the scientific certainty of the fundamental doctrines established by them. My own acquaintance among the representative physicians, anatomists, physiologists, and men of science in this city is pretty extensive; and of them all I can not designate a single eminent anatomist or physiologist who is not, as concerns the fundamental doctrines of psychological science, substantially in accord with the system of Gall and Spurzheim, save in relation to the function of the cerebellum. There is a very general and (I think) well-founded objection to the term adopted by Gall and Spurzheim to designate their system; but the system itself has passed into science, although, as it requires a master to give it a thorough exposition, their mode of conducting dissections has not yet been adopted in medical institutions, strenuously as its adoption has been advocated by Homer and other practical anatomists.

In Germany, while the name proposed by Dr. Gall has been rejected, his method has eventuated in a science styled *Psycho-physik*, of which Wagner, Huschke, Helmholtz, Wundt, and others are among the most distinguished exponents. In England, the early investigations of Carpenter, and the recent and brilliant experiments of Ferrier, to say nothing of Bastian's clinical contributions to the literature of psychology, have resulted in furnishing abundant experimental and pathological evidence of the soundness of the theory that the cortex of

the brain consists of a congeries of nervous centers arranged into groups and finally into lobes. Any one who, without removing the *pia mater*, or, better than that, having previously injected its arteries with a colored preparation, will, with a human brain before him, take the trouble to study the distribution of its arterial circulation trunk by trunk, limb by limb, twig by twig, will find occasion, perhaps, to modify the old conception of a division of each hemisphere into only three lobes. But he will find no occasion to dissent from the view that the convolutions are arranged into groups along the parietal region, and into lobes in the infero-lateral and anterior regions. Having, after a somewhat tortuous route, effected its entrance into the cranium, each internal carotid artery, independent of its anastamosis with the other and with the vertebral supplying the posterior portion of the same hemisphere, is divided into two important nutritive trunks, one of which passes directly forward, dividing and subdividing, while the vertebral turns abruptly outward along the Sylvian fissure, traveling considerable distance as a trunk and then dividing very abruptly into several *rami* of very moderate capacity. At the same time, in its journey upward and forward, the vertebral artery supplies a considerable trunk to the convolutions, which is designated as the occipital; and thus, as concerns the convolutions and their nutrition, the base and lateral regions of each hemisphere are divisible into three lobes—the anterior, the sphenoid, and the occipital. A fourth lobe—the temporal—is generally recognizable on the left hemisphere of the brain, but not so distinctly as upon the right. Anatomists have, therefore, substantially settled upon the term temporo-sphenoid for the second in the order mentioned, thus regarding it as a species of compound lobe. Although these three or (on the left hemisphere) four grand divisions are very distinctly marked at the base, their superior boundaries are by no means so clearly defined. The cause of this lack of superior definition is a very simple one, having its basis in the nutrition of the brain itself. As the two anterior arteries creep forward, sending off occasional twigs, they keep well within the parietal region and traverse it longitudinally from tip to tip, in such a manner that, while the inferior and lateral region of each hemisphere receives its nutrition from three arteries and consists of three lobes, the middle region from tip to tip is fed by a single artery. The result is, that this region shows no such distinct lobulation as appears at the base, and that, as marked upon the base and inferior surface of the hemisphere, the several lobes ascend only about three-fourths of the distance from the base to the top, and there terminate. The portion fed by two long arteries traversing the middle of the brain from one end to the other, may be very properly divided into anterior, superior, and posterior parietal regions, but it is anatomically and physiologically inaccurate to speak of it as divided into lobes.

As respects its relations to such nervous centers as the corpora striata, the optic thalami, and the quadrigeminal tubercles, the fibers radiating from these bodies are not, so far as I have ever been able to find, concerned in the structure of the parietal region. On the other hand, its fibers for the transmission of activity descend and enter into the structure of the great longitudinal commissure of the brain, which associates the functions of its many centers, and completes its comparative isolation as the great tract of perception, ideation, moral judgment, religion, self-feeling (German, *Selbst-gefühl*), and social order, from the great centers of purely animal and motor concern that lie below.

I am thus particular in bringing out these important facts of structure, nutrition, and physiology, because, while Dr. Carpenter has gathered from comparative anatomy that the development of the cerebrum posteriorly is always relatively greatest in animals of the highest relative intelligence, he has offered no adequate explanation of the fact, and has left it to be inferred by such inexperts in anatomy as the PHRENOLOGICAL JOURNAL has just been reviewing, that the posterior lobes are the special seat of the intellectual faculties. There is no

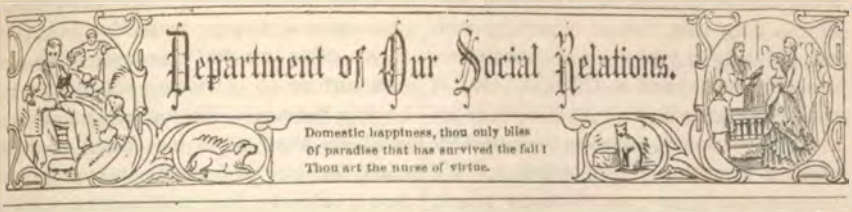
doubt, other things being equal—but when are they equal in any two individuals?—that the length of the parietal tract is a pretty accurate index of intelligence. This, however, is a vastly different thing from maintaining that the centers of perception and ideation are situated in the posterior quarter of the cerebrum; a position that Dr. Carpenter has never really taken, and is too profound a physiologist to entertain for a single moment.

A word in passing, as to the ground taken by Dr. Carpenter, "that the first rudiments of brain found in ascending the animal scale, are the rudiments of the anterior lobes." In a short memoir respecting the development of the rodent brain, embodying a series of researches into the embryology of the common mouse, published in the 1876 volume of the PHRENOLOGICAL JOURNAL, I have described at some length the first nutritive centers of the embryonic mammalian brain; but I did not, if I rightly remember, indicate their exact situation. That is easily found, however, in the mature organism, particularly as concerns the anterior and middle cerebrum. A mammalian brain, as I showed in that paper, starts with four nutritive centers, two anterior and two posterior, which first appear in the embryo as four minute vesicles at the terminating points of the four nutritive currents represented in the mature animal by two internal carotid and the two vertebral arteries. Since writing that article I have, fortunately, had opportunities for examining, after careful preparation for the purpose, five human embryons of from four to seven weeks' development, with the result of obtaining the fullest confirmation of the points then advanced. It can not be stated with any degree of exactness that the two anterior vesicles are especially rudimentary of the anterior or of the middle lobes, their situation as concerns the mature brain being at points nearly coincident with the roots of the olfactory bulbs, just exterior to the optic crossing. The terminations of the two internal carotid arteries, the mammillary bodies, and the pituitary body, the internal portion of the Sylvian fissure, the roots of the olfactory bulbs, and the optic crossing, lying near together upon the under surface of a mature brain, all mark with sufficient anatomical precision exactly where the building of the organism commenced. The Gosserian ganglia, the optic and auditory organisms, the olfactory bulbs, and the pituitary body have already made considerable progress before the development of the cortex, either anterior or posterior, commences. In the posterior region, the medulla oblongata marks the situation of the primitive vesicles, the fundamental portion of the cerebellum follows; and, having united, the vertebral arteries pass forward as the basilar, building up the great vaso-motor center, the pons varolii, almost simultaneously with the superior portions of the cerebellum and the inferior portion of the occipital lobes of the cerebrum. The cortex of each hemisphere grows forward, outward, and finally upward, simultaneously, from four different points, the occipital, the sphenoid, the temporal, and the anterior, the completion of the great parietal tract I have described coming last, and taking place from before backward, just as in the brain of the rodent. In studying the adult nervous system of the vertebrate, the indicative fact that the optic nerves and the fifth pair are each furnished with a sheath as far back as the optic crossing and the Gosserian ganglia respectively, while their more posterior sections are deficient in such a membrane, can not fail to strike the acute observer as a point of the utmost importance, as showing that the anterior, not the posterior, sections of these nerves are the more primitive. Complex comparatively as the vertebrate brain is, even in the most inferior fishes, if its primitive form is ever established, it will be found to merge itself into a nervous collar of four or six ganglia, lying across the gullet, of which, possibly, the now comparatively insignificant ganglia of the fifth pair are relics of the two exterior, and the olfactory bulbs of the two interior. In some fishes the former are centers of motion to the body to a considerable extent—an evidence of their primitive importance in the nervous life of the vertebrates. I have not had an opportunity of examining with care the collection

of triassic fossils in the possession of Dr. John S. Newberry, of the New York Academy of Sciences, which contains examples of a yet cartilaginous spinal column, combined with considerable solidity of the exoskeleton, and may possibly furnish convincing testimony on this point; but I shall take an early occasion to study it thoroughly and report upon its data, which Huxley, during his recent visit to this country, regarded of the utmost importance to science. From a hasty examination, the utmost that I can say is that it appears to contain more nearly what would be expected as transition forms between the crustaceans and the lowest existing fishes than any public or private collection of fossils either in this country or Europe.

The question whether the two larger masses, posterior to the olfactory centers in the brains of the inferior fishes, are the proper homologues of the cerebral lobes in the higher vertebrates, so far from being a dubious one, must be decided in the negative. These masses are neither more nor less than very large optic centers. In such fishes, the optic crossing lies directly beneath the anterior edges of these bodies, and is rooted directly in them, they themselves consisting each respectively of a core of nervous matter enclosed in a thick envelope of the same, just as the stone of a plum is enclosed within the pulp, and the anterior end of the medulla oblongata lying nearly as far forward as their anterior edges. The cerebellum consists in brains of this type simply of an elevated cup-shaped tubercle resting upon the surface of the medulla oblongata just behind the optic centers. It has two peduncles, but is not divided into lobes. Such a brain as this, so far from being rudimentary of the anterior lobes of the human brain, is simply a series of sensory and motor masses. At the front lie the two small egg-shaped olfactory centers; next in order, directly behind, are the two large rounded masses that receive the roots of the optic nerves at the angle effected by their union, for they can scarcely be said to cross; behind and between the latter, but having no organic connection with them, the cerebellum rests upon the upper surface of the medulla oblongata. Lastly, two nervous masses, corresponding to the ganglia of Gosser, lie lateral to the five thus arranged. A nervous cord springs from the posterior end of one smell-bulb, and enters the mass of the contiguous optic center, having there a few scattered filaments, while the main part of it describes an arc through the interior of the two optic centers, and finally enters the other smell-bulb at the posterior end. This commissure exists also in the brain of the rodent; and in the human brain the interior root of each olfactory bulb is not a root, properly speaking, but the portion visible without dissection of the same primitive commissural band. The brain I have just described has no corpora striata, no cortex, either anterior or elsewhere, no lobes, and no distinguishable rudiments of lobes. What I mean to say is, that it presents no rudimentary intimations of the complex and compact organism that the vertebrate brain ultimately becomes. Taken as a whole, it is a rudimentary vertebrate brain, but not of one lobe more than another. It serves, no doubt, some useful purpose in the mental economy of anatomists of a certain class to speculate upon such questions as whether the nervous axis of an insect is homologous to the spinal axis or to the sympathetic cord in vertebrate animals; but the conclusions of such anatomists upon purely fanciful issues are not things to be quoted either for or against legitimate inductions of science.

To state in exactly how far the opinion quoted from Carpenter will be found correct, while the theory advanced by Tiedemann upon what, with the best optical assistance of his day, was necessarily unsifted evidence, that the cerebral lobes are derived from the medulla oblongata, is untenable; while it is true that the perceptive function is the most primitive function of nervous tissue in the animal economy; and while it is further true, as an induction from comparative anatomy, that, in any given type of animals, the development of some sort of a brain always precedes the development of a longitudinal nervous axis, it is not true in any manner that "the first rudi-



ments o brain found in ascending the animal scale are rudiments of the anterior lobes." The exact terms are not Carpenter's, I presume; for I can not imagine that the eminent English physiologist knew so little of his science, even thirty years ago, as to hazard such a statement.

It has been noted casually, hereinbefore, that the development of the cerebral cortex of each hemisphere sets out with four centers of nutrition—the anterior, the temporal, the sphenoid, and the occipital—each of which is responsible for its department, and builds up its section by founding subordinate nutritive centers one after another. The disposition of nervous tissue to lobulate is thus founded in the first principles of arterial circulation and nutrition, the founding of new centers being the natural and inevitable consequence of arterial division and subdivision. I have in my possession a preparation of one of the optic masses of a mouse, in which these minute centers of nutrition can be studied in detail, and from which any observer can satisfy himself that these minute nervous masses are themselves subdivided into almost microscopic lobules, each an independent nervous center as respects its structure, which are associated as one body by an inextricable tangle of fibers and processes. Each of these little bodies has its own arterial and nervous vessels, and is a proper nervous center imbedded, with hundreds like it, in the structure of the large visible mass. I instance such facts as these to show that, without regard to other evidence, the first natural inference of a practical anatomist and physiologist would be that such a nervous structure of the cortex consists of groups of centers.

The importance of studying the arrangement of the nervous fibers of the brain and spinal cord lies in the fact that they are lines of physiological activity, as is proved both by experiment and by anatomical inference. When, therefore, it is demonstrated that the great nerves moving the muscles ascend as portions of the two lateral white cords of the spinal marrow, and that these two cords terminate in a corpora striata, it is proved beyond a doubt that those bodies, not the lobes of the cerebellum, are the true centers of locomotion. As respects the rodents, I know this to be the fact from preparation of the whole nervous system, and careful dissection of the nerves of both pairs of legs to their termination in the brain; and I have, therefore, very good reasons for accepting the statements of MM. Sappey and Duval that they have demonstrated the fact as regards the spinal axis of man. So, again, for the most part, the anterior strands of the cord enter into the optic thalami, while the two posterior strands are distributed between the thalami, the quadrigeminal tubercles, and the cerebellum. All this is simple and verifiable enough, if anatomists would only trouble themselves to make preparations of the nervous system and dissect, instead of adhering to the crude method now practiced. It is, as I have found from the experiment, a work of months, after having carefully prepared so small an animal as a mouse, to trace out the minutiæ of the arrangement of the nervous system. With a mouse, this is best done by throwing the animal, after simply skinning it, into nitric acid and alcohol, ten drops to the ounce, which, while hardening the nervous tissue so as to make it tolerably tough, softens the bones and enables the anatomist to peel the brain and spinal axis completely, without injury to its integrity of structure. The body should lie in pickle about 144 hours. A little practice, although the process is tedious enough at first, soon enables the anatomist to unfold the whole spinal axis of a vertebrate animal as neatly as Spurzheim used to unfold a brain during one of his lectures. And when the student has once done this, he knows something of the nervous anatomy of vertebrates. Previous to doing so, he has only a confused, unanalytic recollection of what the books and the professors say.

By the way, I have noticed as a curious fact that the exponents of Phrenology usually have very good heads, and its bitterest critics very bad ones. Is it not possible that wounded vanity may, after all, be instrumental in developing a great deal of the sort of criticism one meets with in the newspapers and quarterlies?

FRANCIS GERRY FAIRFIELD.

BURDENS.

EVERY one who is thrown in contact with another person becomes more or less a burden to that person. We are all burdens to one another, but we do not like to be made to feel that we are. No matter if one be rich and the other be poor, it is still the same, each is a burden to the other. The rich makes the servitude of poverty a burden to the poor, the poor makes the necessity of his presence a burden to the rich. Something must hang heavy upon all our hands, and we are fortunate if we do not make it hang heavy upon our hearts. We do this for one another. We are made to feel that we are in the way, or are incumbrances each to some one else, and this consciousness makes life a dreary burden to too many. If we could each see that we *must* be incumbrances—if we take that view of it—we might learn to be more charitable for any weight upon ourselves. If we could all have only love's burdens, how sweet we should find them to our soul's sense, and how grateful we should be amid our weariness. The husband who loves his wife never stops to count the weight of incumbrance she is to him. The wife who loves her husband is also happy in serving and pleasing him. It is the spirit in which we toil which makes the difference. If we could all delight in pleasing those around us, what a happy world this would be. If one side must do all the serving for no thanks, or for favors returned grudgingly, or each side must growl with dissatisfaction, always at the other side's best, there can be no delight, there must be only the weight of weary pain. A sensitive person will feel dependence too keenly without being reminded of it. Some persons will take double, treble, or unnumbered-fold pay for any favor, and then shout abroad what they have done—never mentioning the pay or the unkindness of spirit in which the favor was granted—but leave people to think them *so kind*. They will make their best generosity of giving or doing such a niggardly, abusive insult to one's esthetic sense or one's sensibility that the memory forever and ever must gall the soul forced to the acceptance of it. A little done in love's way is more than everything in the begrudged way that makes the doing seem more painful than parting with one's best teeth. Don't we all know that *we* are burdens sometime? Can't we do graciously any kindness to another which we should do, which we must do, or which we do at all? Must we growl and snarl and make everybody unhappy? Was the world made for just us alone?

Can we not lighten for one another what we *must* bear, and get, if not enjoyment out of doing, the satisfaction of being appreciated and of having tried to do our best? If we could always see and know the pain we cause, would we not do better? Those who have suffered and felt themselves, might think of this. Some persons, however, do seem to enjoy another's suffering in any form or shape. To let these know upon what you feel tenderest, is to deal to yourself, through their hands, an unceasing succession of stabs in your sorest point of feeling. They like it. They revel in your grief. It is delicious, according to their taste. It makes us wonder at human nature, and question sometimes what must be fiend-nature. It wears upon one's soul and strength to think upon some subjects. We see the facts as they exist, but can not understand why they are facts. Our heads ache and our hearts ache, and we are sick all over with thinking of them. We are sorry we ever learned to know them as facts.

If the knowledge could have come and have kept us from pain, instead of coming with it and making its growth a part of ourselves, it would have seemed so different. Or if it could have come in time to have been an available wisdom to us when we needed it most, it would have seemed better. We learn so slowly, compared with the length of our lives. We act so slowly upon what we do learn. The great lesson that we are all dependent, we ignore so totally in our strength. The sweetness and the confiding trust that is born of happy dependence, we warp and turn into deformity too often in our little ones. Self-dependence in the gentlest natures becomes so twisted out of its true nature. The brightness and frankness that can ask, hoping to receive and receive thrice often for its winsomeness, we force and torture so often into cowardice or unhoping bravery. Do we ever think of the shadows that might not be, if everybody could feel free to make the best of the good that comes to him, and not be reminded that he has robbed somebody of so much? A little is a great deal from love-hands. The whole world could never be anything, if yielded to us hatefully. True love and friendship covet to take and bear their loved ones' burdens. We long to spare our precious from all woe. The spirit makes the difference. MADGE MAPLE.

YOUR PEARLS.

TRUST not the secret of thy soul with those
Who hold their treasures with a reckless hand;
Nor to each ready ear thy thought disclose,
Nor to each smiling face thy heart expand.

Pearls from the ocean's depth too priceful are
To be strewed heedless at the common feet;
Show not to curious eyes the hidden scar,
Nor to the winds thy sacred words repeat;

Else under trampling hoofs thy gold shall lie—
The holy gold of the interior self;
Crushed the rare pearls by every passer-by,
Or given from hand to hand, as vulgar pelf.

It is a lesson taught each separate heart
To shield its gems from universal gaze;
To shine in quiet glory and apart,
Revealed alone on coronation days.

Give freely to the world its just demand
Of sympathy, of kindliness, of trust:
But keep reserved for one beloved hand
The pearls too pure to be trod down in dust.

All lives may know thy gentleness and grace,
All hearts thy loving power may evidence;
But on few hands—oft one alone—dare place
The costly ring of priceless confidence.

—*Galaxy.*

LIGHT IN DARK PLACES.

"This mournful truth is everywhere confessed,
Slow rises worth by poverty depressed."—SAMUEL JOHNSON.

CHAPTER XI.

FRIENDLY INTERPOSITION—BUMPY'S SERVICES.

MR. HAMMOND was one of those men who feel much elevated and important when exercising functions of authority, even if the range of such authority be moderate. As Secretary of the Society which had organized the missionary enterprise in the quarter where the Camp family resided, he deemed himself entitled to the highest consideration of the people who availed themselves of the moral or physical aids offered the community through his superintendency. His good nature did not suffer him to feel very deeply piqued, however, if now and then a beneficiary showed him little gratitude or courtesy, for his intelligence made allowance for roughness on the score of the delinquent's ignorance, and at the same time his strong self-esteem ministered an element of indifference, which sustained his consciousness of superiority and merit. This characteristic enabled him to treat with the miscellaneous classes of the neighborhood very successfully, and his off-hand, authoritative manner had obtained

general respect with all, while many regarded him with admiration, as one possessing "ginooine aristucrisy."

It was, perhaps, a quarter past ten when the Secretary, with Bumpy at his heels, entered the police-station. The magistrate was in his chair, attending to the cases which had been brought in by the policemen of the district, and the usual motley scene presented itself there of dirty, ragged, illiterate, besotted, vice-and-crime-worn humanity; the offenders against law and order on one side, guarded by gentlemen of the shield and baton; their friends, or curious droppers in, on the other, watching the progress of the administration of justice.

Mr. Hammond made his way through the crowded benches to the railing behind which the judge's desk stood, and as soon as he had obtained that high functionary's notice, said:

"Judge, there is a boy here who was brought in this morning charged with breaking down a fruit-stand, and scuffling with another."

"Yes," spoke out one of the blue-coated protectors of public order, "I brought him in with the feller he was a-fightin', an' he's over here."

"What's his name?" asked the Judge.

"Camp—Norton Camp."

"Officer, what about it?"

Norton, on hearing Mr. Hammond speak, had jumped upon his feet, and stood eagerly looking at him and the Judge. Of course, all eyes in the room were turned toward him.

"Well, you see, Judge, these young fellers, and a lot of others belonging to their crowd, was down in Broome Street, corner Thompson; and wantin' to carry off some of the fruit and nuts and things from a stand there these two young rascals just went up and w'ile pertendin' to be fightin', one knocked the other inter the stand, and smashed it down, and then the others rushed up and grabbed apples, nuts and things, and put."

Norton had listened to this statement, his large eyes glistening with excitement and indignation, and once or twice would have broken out in denial, had not Mr. Hammond shook his head as a warning against his speaking.

"Where are the others, officer?"

"Well, Judge, you see, I was alone there on my beat, and didn't know nothing about this till the owner of the stand hollered fur me to come up. When the stand kum down, he heard the noise, and rushed out of his store, and collared these two larks, and when I kum up, told me how 'twas, and I brought 'em in. The rest had vanished."

"Let the other boy stand up," ordered the Judge.

"Certainly they don't look much alike," he continued; "the younger one with the curly hair looks as if he'd been brought up to do better than to get into a scrape of this sort. I guess it's a case of bad company. 'Evil communications corrupt good *measures*;'" and, as if prompted by the suggestion which this false rendering of Paul had furnished, he went on: "This is the reason, I suspect, why so many hucksters are hauled up for selling their stuff by the quart, and declaring that it is by the small measure." The crowd of hangers-on saw wit in this, and laughed.

"May I be permitted a word?" asked Mr. Hammond.

"Yes, sir, fair speech is free in my Court-room."

Another sally from the crowd in loud approvals.

"Silence!" cried an officer. The Judge smiled benignly.

"I would only say that the smaller of those two boys is the only son of a very respectable woman, who, as I personally know, has spared no pains in his moral education, and I share her opinion that he is not guilty of any intention to steal, but was a little imprudent this morning in endeavoring to obtain justice on his own account for what he considered a gross act of wrong done to him by the large boy at his side."

"All very fine, sir; but my experience with these sons of *very respectable* women is not favorable to their moral conduct, whatever may have been their moral education."

"Will you let him say a word in his own behalf?"

"Yes. Speak up, boy, and tell us about it. Be quick, as time presses."

"I tell you the truth, sir, that I didn't think of stealing the fruit, nor doing anything wrong. I wasn't playing or talking with this boy or the others, though I know most of 'em, for they live near our house. I was standing near that boy by the gentleman," pointing to Bumpy.

Mr. Hammond here explained in response to an inquiring look from the Judge, "I brought him here, sir, because he came to me and said that he was present when the scuffle took place, and saw the whole of it. But hadn't we better hear the rest of the boy's account?"

"Yes. Go on, sir, with your story," commanded the Judge.

"Yes, sir," returned Norton. "I was standing near Bumpy, that boy —"

"Strange it wasn't he who bumped you against the stand," commented the Judge, whereat the lookers-on laughed again.

"When this boy here came up and told Bumpy to hook some of the oranges and fetch them to him, Bumpy said he wouldn't. Then he asked me to do it, and said he'd spoil my face if I didn't do it quick. I told him I wouldn't steal for him or anybody else. He then just run against me before I knew what he was a goin' to do, and pushed me against the stand; and I couldn't save myself from falling—indeed I couldn't, sir. And I felt so mad against him for doing such a mean trick, that I jumped up as soon as I could, and went at him to give him a good lick—whipping. He's a good deal bigger'n me. I—but I didn't think of that, I was so angry."

"You had a right to be angry, boy, if what you say is true. Say, you big lubber, how is it?" asked the Judge, addressing "cross-eyed Tim." "Look at me straight now, and answer."

"I don' know," replied Tim, stolidly.

"You don't know whether he was too much for you, who are big enough for two of him?"

"I'd licked him like blazes, if that cove and the cop hadn't stopped it. Kin do it easy."

"Tell me," said the Judge sternly, "if what the boy has told is true or not?"

"You know it's true ev'ry bit uv't, Tim," cried Bumpy.

"Look here, bub," said the Judge to that irrepressible, "perhaps you know more about it than is good for you; so keep your tongue quiet, or you may have your head bumped. Now, Tim, if that's your name, what have you to say?"

Tim was not going to incriminate himself for the sake of another. He had too much of the low cunning of the experienced street-boy for that, and an unscrupulous mendacity ready for use to save himself, if possible, from the penalty of his own wrong-doing. In answer to the Judge's peremptory demand, he slowly drawled with impassive countenance—

"All a lie! He wanted ter nab'n oringe, 'n' I told 'm I'd smack 's jaw ef he darst ter. Then he jist went ter the stan', an' I after 'm. Then he trips aginst the things, an' knocks 'em over onter the side-walk, an' 'fore I know'd wat he wuz a-goin' ter do, he jist pitches inter me. The cop knows the rist ov't. That's all I knows on't;" and Tim assumed an air of injured innocence which comported ridiculously with his vicious physiognomy and small crossed-eyes, while Norton stared at him bewildered by such an exhibition of cool malice.

"Where's the man who ordered you to arrest these fellers, officer?"

"He said he'd come down and make his complaint to-morrow morning," replied he of the star.

"Then the case must go over. Lock 'em up."

"But, Judge," interposed Mr. Hammond "must this young boy, or both these boys be shut up to await the convenience of their accuser? Is it not doing them a great wrong, and exposing one, at least, to influences which may have a very pernicious effect upon his moral character?"

"I don't want to hear any sermons here, sir," roared the Judge; "time's too valuable to be taken up in that way. Go see the man yourself, if you want to. These young vagabonds need a lesson."

"My good sir, this is the first time that boy has been accused of— "

"The old story—Always must be a fust time. Better nip it in the bud by giving him a taste of jail discipline. What's the next case?"

Mr. Hammond did not like this manner of treatment, of course, but he was not so new to such scenes that it was altogether unexpected. High judicial talent and a delicate discrimination he did not look for in a Police Court; yet, like all who are solicitors for moral reform, he felt that wisdom was greatly needed there to guide the administration of authority. It is the abuse of justice and kindness, under the cloak of authority, which greatly embarrasses the work of the humane among the poor and ignorant.

On emerging from the building, Mr. Hammond discovered Bumpy leaning against a horse-post on the opposite side of the street, and called him. The boy ran across, and said in a low tone:

"I reckoned as how they war a-goin' ter jug me, an' I just slipped out w'ile that cove was a tellin' his thunderin' big lies 'bout Woolly."

"You're a keen one surely, and can take care of yourself."

"I tries ter, sir, but lor', that Woolly don't try a pin to git outer trouble when 'taint his fault enny more'n 'tis that 'kiyi's.' He's a good 'un, though, I kin tell yer, an' I'd like ter see cross-eyed Tim git strapped for tellin' on'm that way, I would."

"Well, my boy, I have some business to look after, and must be going. You can go to Mrs. Camp, and tell her that the Judge ordered the boys to be remanded for further examination to-morrow morning, when the fruit-seller is to appear against them, and that he refused to entertain any application for Norton's release; but that probably to-morrow an arrangement will be made in that behalf; tell her not to be over-anxious, as it will come out all right."

Mr. Hammond walked away and Bumpy turned up toward Houston Street. "Less see," he meditated; "'Manded fur 'xamination'—yes, that's wot the feller sed; and suthin 'bout applercatin ter let'm loose termorrer. But I guess this yer cove knows 'nough 'bout them things hisself, Mr. Watsyer-name, ter tell'm, 'thout gittin' 'm criss-cross."

CHAPTER XII.

COMMUNICATION WITH THE PRISONER.

BUMPY made a very explicit report on the situation in his own graphic style, and added some remarks, born of his hard experience with a father whose drunken habits frequently brought him into collision with the police officials, which were very acceptable counsel to the troubled widow. As it was near noon, she made a package of some of those excellent biscuit, to which we alluded in a previous chapter, divided and spread with cherry-juice (Norton liked to eat the juice of stewed fruit in this manner), and handed it to Bumpy, with the request that he take it to the police-station for Norton. She had also prepared one, which she gave to the boy who was proving himself worthy the title of friend by his ready willingness to serve her in this hour of need.

"My eyes! aint this jist good for a feller's stomjick," mumbled Bumpy, as he wended his way down the stairs, his mouth crammed with the fruit and bread. "Talk 'bout Johnson's cream-cake, will yer—'taint nothin' to this; ef't don't jest touch the spot, this indivisible aint no judge of sich fixins! Gelory gum!"

This was the tenor of his musings while the biscuit lasted, and until he reached the place of Norton's confinement, where he addressed himself to a clerk with whom he was acquainted, and having shown the package, and a note which Mrs. Camp had written to Norton, he was permitted a brief interview with the prisoner.

As might have been expected, the sensitive boy was restive and sad under this new experience. He was restive, because his high-strung nature rebelled against the thought of being deprived of his liberty, and that from no positive wrong of his own commission. He was sad, chiefly on account of the anxiety occasioned to his mother and sisters by this mishap. "If I could only have a chance," thought he, "to

see mother for a few minutes, and tell her that I didn't do anything wrong intentionally, I'd feel so much better. Mother would believe me against all the policemen and fruit-sellers in the world." If Mr. Hammond had stopped for a minute to talk with him, that would have helped much to alleviate his distress. But Mr. Hammond was in a hurry when he left the magistrate, and did not think of having a talk with the accused. In fact, he judged that his presence there should itself give much encouragement to the boy by the interest in his case which the Secretary of the Mission thus manifested. Norton did indeed experience a very happy sense of relief when he saw that important man speak in his behalf, and he expected release as a necessary result of such advocacy; but when he found himself sent back into the apartment where was grouped a score of men and boys, whose rough garbs and rougher language and demeanor denoted that for them accusation and arrest had some certain warrant, his heart sank. Bumpy's entrance, however, broke the chain of his melancholy reflections, and with an exclamation of joy, he sprang toward him.

"Oh, Bumpy! you here, and something from mother?"

"Yes, sir; suthin' good to eat, and suthin' good to read, I guess, too."

Norton grasped the parcel and letter with haste, and tearing open the letter, read:

"MY DEAREST BOY: I know all about the affair, and believe you innocent. Keep up a good heart; be patient. Trials well borne bring out the noble in us, and make us strong. I shall come to see you as soon as I can. Any message you have to send will be carried by Bumpy, who shows himself a true friend to you. MOTHER."

"She doesn't believe I tried to steal!" cried he.

"No, guess not; why should she? Didn't I tell her all 'bout it?"

"Did you, Bumpy, how that Tim threw me against the stand, and I wasn't to blame for that; and how I couldn't help going at the mean feller, though I'm sorry I did, 'cause it looks kind o' bad for me."

"Ef yer'd jest a-rund away like us other fellers, Woolly, yer'd a-got clear, an' not a-bin jugged this way."

"Yes, but I wouldn't have run, because it wasn't my fault."

"Then yer'd bin tuk up, any how, fur that feller wat sells the oringes war jest blazin' mad, yer know, and wudn't a stopped ter ax quistions."

"I s'pose so," replied Norton.

"Well, mother knows the right of it, and you, too, Bumpy; so I guess I can stand a little of life in here."

"'Taint so bad es sum folks think," said Bumpy, encouragingly; "I've staid in a wusser wid pop, wen he'd bin tuk in fur spreein', many a night. But say, Woolly, s'posin' I jist go up ter Mister Stanley's, where yer goes fur the waste stuff, an' tell 'm 'bout this. P'raps him and that misshun chap 'll work up yer case, as the law men say, and git yer out all right, hey? Wot yer say?"

"I don't want to trouble him."

"Nothin' like havin' good men workin' for a feller in a trap, my pop sez. Guess I'll go hum to grub, an' then run up."

"Won't you go and see mother first, and ask her what she thinks about it?"

"Yis, ef yer wants me ter."

"That's a nice fellow, Bumpy, and tell mother not to worry, as I shall get along pretty well; I've something good to eat, anyway."

"Yer can jest bet on that, Woolly, fur this individible had one of them biscuit hisself; an' honey an' peanut-taffy aint no switch to 'em. Well, I'm orf. Take keer on yerself."

"Good-bye, Bumpy, and come in again, if I don't get out soon."

Bumpy disappeared through the iron-bound door, and Norton sat down in a corner to discuss the "something good" in the parcel. He was hungry, and each morsel was the more welcome to his palate because it came from the hands of a beloved mother who believed in his integrity.

Bumpy went to his squalid home, and swallowed the coarse fare provided by his "marm," and then ran over to Mrs. Camp's, where he delivered a voluble speech on the physical and mental state of Norton, wind-

ing up with his suggestion with regard to obtaining the assistance of Mr. Stanley.

"Lor', missus," said he, "he's yer man. That misshun feller aint any great pertaters down 'mong them perlice, cos he don't know nothin' 'bout talkin' ter 'em. They jist need sassin' they does, an' nary uv yer Sunday meetin' talk."

"I should be sorry to call upon Mr. Stanley, my boy, unless it were absolutely necessary. Norton will endure patiently, I think, a few days' imprisonment, if he must. Certainly a little thing like the loss of a few oranges will not be made an occasion for severity toward a child like Norton."

"I dunno, missus. Sometimes them fellers is mighty hard on boys, and sling 'em up fur a month, an' wuss, jest fur nothin' 'tall. Ef that chap wat keeps the stan' comes down and swears hard, it 'll be purty bad for 'em, p'raps, ef ther aint noboddy roun' ter tak' Woolly's part."

Naturally enough, these candid words, spoken directly from the practical experience of the boy, were persuasive in their effect upon Mrs. Camp's hesitating will. She had a deeply-grounded aversion to engaging the attention or interest of people in her personal affairs, and often experienced serious inconvenience and loss because of this disposition. She felt, indeed, that she had no right to draw upon the time and industry of others, except in an emergency, and the emergencies which brought her to such a course rarely occurred. Most of the occasions in which the average housekeeper deemed herself warranted in calling in a neighbor for assistance, this earnest and sensitive woman considered trivial, and easily disposed of by energetic management. A case may illustrate her method. One day Dell found a piece of glass in the hall, dropped, probably, by some careless glazier who had made the tour of the building in his search for a job. The little girl picked it up, and started on a run to show it to her mamma, but unfortunately stumbled over the door-sill and fell, the sharp glass cutting a deep gash in her upper arm. She screamed from pain and the sight of the blood, and immediately drew Mrs. Camp's attention. Instead of rushing to a neighbor and imploring her to go or send for a doctor, the mother instantly took up the child, and sitting down with her in her lap, calmly examined the wound. Finding that it involved no important blood-vessel, she took some cold water and a small, soft sponge, and washed it clean; then, with a needle and some silk thread, quickly and skillfully drew the lips of the wound together, Dell, in response to her soothing, cheery talk, quietly submitting to the little pain thus given her, and watching very closely the operation. The wound being closed in this manner, a soft, light bandage of muslin was put around the arm, and an hour afterward Dell appeared as lively and happy as was her wont.

"I niver see the bate of that woman down there, that Missus Camp," said Mrs. Moriarty, to whom Dell showed her arm the next day after the accident. "Anybody ilse wud ha' screamed an' set us all crazy-like; but the little darlint is taken so quietly, and trated better than the docthers cud do it, and niver a word do yer hear till 'tis all over wid."

Mr. Stanley had shown a real interest in Norton, and the poor widow now felt that a sort of crisis had come in her boy's life, and that a strong effort must be made to save him from a possibly severe infliction of judicial discipline. She reflected a little upon Bumpy's admonition, and then signified her willingness to have him apply to Mr. Stanley in Norton's behalf.

CHAPTER XIII.

THE EXPECTED VISIT—AN ADVOCATE.

THAT afternoon at about four o'clock a moderate knock was heard at Mrs. Camp's door, and Dell sprang to open it.

"My little one, does Mrs. Camp live here?" inquired a gentleman whose full-bearded face would have at once suggested the second person in the firm of Taylor & Stanley.

"Yes, sir. Will you walk in?"

"Thank you," and Mr. Stanley entered the room. Mrs. Camp arose from her chair and advanced to meet the gentleman.

"Good afternoon, Mrs. Camp; my name is Stanley."

"Good afternoon, sir," replied the lady, a little awkardly perhaps, for she had the impression that the call was in response to Bumpy's application, and, as was usually the case at first in her relations with others, any sense of obligation induced a temporary embarrassment; "Please to take a chair, sir—Mr. Stanley," assigning one for his use. "I feel greatly indebted to you, sir, for the warm interest you have exhibited in Norton."

"Don't speak of it, my dear madam. The boy commended himself to me at first sight, both by his honesty and by his strong physiognomical resemblance to a former friend, his father. You may not have heard of me, Mrs. Camp, for our intimacy was of comparatively short duration, only while we were members of the same company. I had been transferred to that but six months before the battle at Gettysburg, yet in that six months Lieutenant Camp won my deepest respect, and I can add, my gratitude."

"My late husband mentioned your name in two or three of his letters," said the widow.

"Do you remember the connection in which such mention occurs?"

Mrs. Camp had lately re-read much of her husband's correspondence while he was in the army, to ascertain his relation to the very person now in her presence—his interest in Norton leading, of course, to the repetition of what was always an avocation which mingled sweet and melancholy reflections.

"His letters were somewhat brief, owing to the rapid movements of his division of the army at that time, and his allusions to acquaintances were necessarily brief."

"He was one of the busiest officers I ever knew, madam. Conscientiously so. His time ever seemed full of duties and services. No man in our regiment was more regretted than Lieutenant Camp. But if your memory serves you, it would be a matter of gratification to me to know in what way my name was mentioned at any time. I would not, of course, appear presumptuous, and, perhaps, as this is the first time we have met, it is a piece of boldness quite unwarranted in me to ask this."

"A friend of my husband, sir, could scarcely be culpable of discourtesy. In one of his letters he writes something like this (Mrs. Camp usually spoke of her husband's sayings and doings as of one who was living):

"'Stanley and I have been discussing the relation of character to organization. For one who has never read Combe he is an apt pupil, some knowledge of physiology which he possesses being of great aid in clearing up the few doubts I have entertained, as you know, with regard to the operation of certain faculties.'

"In another letter he writes:

"'I should tell you in passing that I think our talks have been of service to the sergeant, for he no longer views life in the cynical way which was his wont, early in our acquaintance.' He does not go into details, sir; but I infer that Mr. Stanley viewed life at one time from the cold, critical plane of his intellect."

"Worse than that, madam. When I entered the army I had become embittered in spirit, or rather mind, on account of the inconsistencies of people generally. I had lost confidence in popular morality, so much of falsehood and wrong were perpetrated by those who claimed the best moral and inteilectual culture. My reading of philosophy had inclined me to take at first utilitarian views of the principle termed conscience, and my observation of practical human nature had about convinced me that selfishness was the basic element of individual endeavor, over which a thin film of strained and mawkish sentiment was spread, which partly disguised its harsh and repulsive outlines. I deemed that culture helped men to disguise their selfishness, and to lubricate their methods of dealing. I saw little that was desirable or lovely in life, therefore, and was fast degenerating into misanthropy. I had my share of the world's selfishness, of course, and that led me to become a soldier. I wanted to exercise authority, and where is a man more thoroughly a master than when exercising the function of an officer in a company? Well, to be brief, I fell in with Lieutenant Camp, was in immediate association with him, as

you know, being orderly of the company. I had been subject to rigid treatment from my other superior officers and expected it from him. But no; he approached me in a totally different manner; appeared to comprehend my mental diathesis in the start, and in a few weeks I found myself regarding him in a way that was new to me; in fact, as a kind, solicitous friend. I owe to him that most important of acquisitions, a knowledge of myself. He taught me how to analyze my own character, pointed out the reasons for my taciturnity and cynicism, and counseled me with reference to their correction; and all in so simple a fashion that it was truly a wonderful revelation to me."

"My husband was a most earnest advocate of the phrenological system," said Mrs. Camp, whose feelings were warmly interested in the remarks of her visitor; "and who could be otherwise who has been brought into practical contact with its workings as a revealer of mind and an instrumentality for the improvement of character?"

"No one, surely," replied Mr. Stanley. "I sent for treatises on the subject, and in the intervals from duty read them carefully, and, at the same time, applied the principles in my relations with our men. I endeavored to co-operate with the lieutenant as far as I could, and I think that we were very successful. It was said that our company was the best managed in the regiment. There was scarcely a man, madam, who would not have risked his life for Lieutenant Camp. But I am interrupting you in the midst of duties which are of importance to you, I know."

"I am only too happy to have an opportunity to speak with one who knew my dear husband, sir. Such an occasion comes so rarely now that it even sets aside the consideration of matters of urgent moment."

"I came, madam, not as a curiosity-hunter, but to see the lady who had honored the man, whom I remember as a benefactor, with her hand and heart, and who stood in the relation of mother to a youth who has recently commended himself to my notice. I shall not express my concern in finding this lady in such an environment, for I am impressed by what I see and know that this condition is not one of indiscretion. But will Mrs. Camp permit me to hope that if a change may be brought about, she will, for the sake of her children, accept it?"

"My children are my chief concern, sir; but the condition in which you find me is not so pitiable as you may think. We are, at least, tolerably comfortable; and we are not inclined—excuse me, Mr. Stanley—to accept charity unless compelled by necessity. Any improvement in our circumstances we would prefer to earn rather than feel indebted to others for it."

"But, my good friend, you deserve the best circumstances society has to offer," said Stanley, with a tone of warmth in his voice.

"I conceive that I deserve only what I earn," said the lady.

"Precisely; and a woman who possesses that intelligence and experience which can render life happy, even amid scenes of wretchedness and want, should be assigned a place where her influence will have a less restricted operation. Society needs her improving hand as much in Madison Avenue as in Mackerelville. You, Mrs. Camp, are not in your place here, because of your children, and because your usefulness can not have proper range. Your hands are tied by necessity. But pardon me for these personalities, and permit me at some future time to discuss with you measures tending to a change of residence. I feel, madam, a deep sense of obligation—have carried it, indeed, since my soldier days—and have always intended to render some return to Lieutenant Camp or his should my ability and an occasion permit. No protest—"

A tap at the door here drew attention. Dell opened it, and Bumpy entered in his customary manner. Like boys of his class, especially when entrusted with a service of importance, he plunged into the midst of what there was to be communicated. So jerking his cap off, he addressed Mrs. Camp with:

"Soon's I got hum, Missus, me mother gin me an errint down ter Hudson Street wot tuk me over'n hour. Then I went over ter Stanley's (Bumpy had not the pleasure

of Mr. Stanley's acquaintance, and at the mention of his name that gentleman looked inquiringly at Mrs. Camp, who, however, made no sign, preferring that Bumpy's message should be the agent by which the situation of Norton would be made known), an' they told me that he was out, but might be in agin 'fore long; so I waited 'n waited 'bout 'n hour, till I was tired, and then I kum here."

"Were you looking for me, my boy?" inquired Mr. Stanley.

"Ef yer name's Stanley, I jest was." The merchant nodded, and Bumpy went on. "I s'pose the Missus has told yer 'about Woolly bein' tuk up."

"No. Has your son — I presume he means your boy, Mrs. Camp — been arrested?"

"Yes, sir, I regret to say it; but not for any misdoing of his own."

"Why; how was it? This must be looked into."

At a sign from the lady, Bumpy related the affair and the subsequent proceedings in the court-room, and then Mr. Stanley said:

"While I regret this occurrence because of the anxiety it gives you, madam, I am pleased somewhat because of the opportunity it furnishes me to be of service to you. Permit me, then, to take this matter into my own hands."

"Oh, sir," said the widow with suffused eyes, "I would not trouble you for—"

"Trouble! This will afford me a change of occupation which will not be disagreeable. Business does not press, so that I have all the time needed; and, besides, I think that a little energetic management this afternoon and to-morrow morning will give Norton the freedom of the city again. And I'll be about it now. Trust to me."

His warm and frank manner, added to Norton's hearty delineations of his excellence, had quite won the respect of Mrs. Camp; and then his generous proffer of help—what less could she do than to take Mr. Stanley's hand on his departure, and if her eyes did not speak her thanks fully, her gentle clasp supplied what was wanting.

H. S. DRAYTON.

(*To be continued.*)

POCKETS AND CHARACTER.

WE take the following from the *Home Journal;* there is some truth in it, as well as material for amusing reflection:

"Whether we consult the fashion of our fellows' pockets, their contents, or the peculiar ways in which they are manipulated, we shall find them rich in suggestions. A curious observer might profitably spend a good part of his time in a fashionable tailor's shop—in the ostensible capacity of deputy assistant-measurer, perhaps — but really with an eye to divining the souls of the various customers from their several tastes in pockets. He would note, in the first place, that in the matter of pockets, and in that alone, does the fashionable tailor aforesaid permit his votaries any freedom of choice. He knows, being wise in his generation, that discretion is the better part of despotism; and that a man will sooner submit to wearing a fashionable strait-jacket than to being overruled — even in a fashionable direction—in his pockets. Accordingly this young swell of the haw-haw type orders his trousers-pockets to be cut vertically down the seam; while that other who belongs rather to the horsey order, and wears heavy rings, broad sleeve-buttons, fancy scarf-pin, and glittering watch-chain, must have his open horizontally in front of the hip. Mark, again, the gulf that divides the gentleman whose handkerchief peeps from an outside breast-pocket from him who wears it mysteriously within; how different are both from the respectable personage who produces his bandanna from the skirts of his black frock; and how superior are all three to the wretch who smuggles his 'wipe' into the pocket of his trousers! Here is a schoolboy; he cares little for the appearance of his pockets, so that they are deep and stout, as his

nature is ardent and insatiable. Yonder comes a yellow-clawed stockbroker who will have buttons put to his pockets! and after him a commercial traveler, whose pockets are a specialty. Next — but we must cut this procession short.

"When we see an unkempt, anxious individual, who refers on all occasions to a sequestered inner breast-pocket, as though he owned nothing that was not invaluable, we know him for an injured bankrupt or a deserving refugee. A timid, retiring nature is prejudiced in favor of waistcoat pockets, because he can get in and out of them readily and inconspicuously. Large, pompous men, on the contrary, love to fetch things from their tail-pockets, with a grand sweep and a flourish. The bald-headed, complacent philanthropist rejoices in wide, baggy pockets, to hold the overflowings of his heart; footpads and suspicious characters like baggy pockets, too, generally in their overcoats. A rich country squire, with cheery voice and broad shoulders, prefers doing business with the side-pockets of his Knickerbocker sack-coat, which are accessible, off-hand, and without bothering. And as there are pockets proper to different types of men, so also are there pockets peculiar to all the seven ages, from the child, with his single trousers-pocket, to the lean and slippered pantaloon, who feels for his tremulous snuff-box and gold-bowed spectacles.

"Pockets are a great assistance in striking attitudes, and a man's attitudes betray him. Insolent wealth thrusts its hands into its trousers-pockets, rattles its money at you, and measures you from your head to your boots. There is a species of jaunty exquisite, who poises his white forefinger and thumb in the pocket of his waistcoat. There is a bluff, stern-browed man who shoves his fists defiantly into the side-pockets of his roundabout jacket; there is the elderly, old-fashioned gentleman, who gets his slender hands into the pockets of his broad-cloth skirt-coat, and turns his back upon the fire.

"On the whole, it appears that the smaller a man's nature is, the more self-conscious and fussy, the greater his dependence on pockets. The more pocket, the less man; petty people run to pocket. But the man who ignores pockets proves the wealth of his internal resources. Heroes make little account of them—put their hands in them only for the purpose of taking something out to do good with. The hands of simple, great, preoccupied men hang by their sides, awkwardly perhaps, but quite respectably. Pockets are anti-Christian—at least the Apostles had none—and we shall look for them in vain in the New Jerusalem. The ideal is pocketless."

THE POETRY OF LIFE.

WATCH the foaming cataract! See how sparkling, how evanescent, how intangible, yet what a soft veil it forms to the black, thundering surges below; observe it clothing each tree with mossy verdure, and gemming every leaf with a diamond! Over all it hangs a rainbow and then soars away a freight of cloud-blessings for the waiting earth. Such is imagination. It softens and beautifies the harsh, restless, stubborn facts of life; it bends an arch of hope whose key-stone reaches Heaven.

Imagination creates an ideal, a king to whom all the other mental faculties delight to render homage. Poetry, not always that of rhymes and measures, is its natural language. Poetry is the voice of Nature, and therefore immortal. How many of the ancient poets have survived their contemporary prose writers! Why? Because the electric chain of sympathy strikes a spark wherever it touches the great heart of humanity. To-day despair, with the doomed Queen of Carthage, ambition with Ulysses, or religious enthusiasm with Æneas, springs as promptly as in the time of Cæsar.

Imagination develops with the earliest dawn of intelligence. The little prattler on your knee often startles you by the beauty of her conceptions. A child too young to know the meaning of death, stand-

ing for the first time by an open grave, asked: "Will he not come up again?" "Yes," was the response, half in fear lest the spectacle of burial should make death a gloomy terror. Still the infant imagination was busy. At last her eye brightened, and with a glad smile she said: "Just like the flowers; will he not?" No terrors for the little one had the cold, damp earth, the narrow coffin, the ghastly shroud, for her mind, fresh from the Creator, grasped instinctively the twin ideas of resurrection and immortality.

Reading over-wrought fiction and hot-bed mental development give rise, in extreme youth, to a sentimentality that partakes of the ludicrous; and the boy-lover of fifteen addresses his fair inamorata in such impassioned strains as the following:

My sweet Araminta,
My love and my treasure,
I think of you always,
My joy and my pleasure.

Your eyes are of azure,
Your hair gleams so brightly—
(Oh! fie on this rhyming,
I can't do it rightly.)

I think of you always,
At night and in daytime,
At home or when traveling,
At school or in playtime.

Now tell me you love me,
That only will save me
From joining the army,
Perchance, or the navy.

If father won't let me
Do one or the other,
You'll find in the river,
Some morning, your lover.

Araminta, deeply moved, pens on her window-ledge by the moonlight an answering sonnet more elegant, more sentimental, and with an equal amount of real feeling. A few months elapse, and the youthful pair look upon their dream of love as a thing of the past. Older and wiser heads laugh in scorn, for they can not fathom those warm, throbbing hearts, and behold there still shrined in undimmed lustre the beautiful ideals which, for a brief season, seemed to assume the forms of Araminta and Euphrasius. The same ideal follows the boy to manhood; it lures him from the haunts of vice and checks the greed of gold. As Araminta stands at the marriage-altar her soul is filled with a holy vision of a trust more tender, of a love more forbearing than the world has ever known, and ever, amid the crowded cares of maturer life, she is pressing upward toward this pure ideal.

Middle age, with its many burdens, too often crushes to the dust the imagination, and men become mere machines. Let this not be so. If you can not write poetry, think it; if you can not think it, read it often; if you have not time for that, sing hymns at your work. While her little ones were sleeping, a weary mother penned, in reply to an unjust accusation, the beautiful hymn—"I love to steal awhile away," which thousands of her toiling sisters have sung and found therein the relief of sympathy.

How sweetly through the quiet of old age steal the poems and ideals of youth! A few have been attained; most of them soared higher at each effort to grasp them. An aged pair alone by the hearth whence so many have gone out, clasp each other's hands as they talk of the long journey "up the hill thegither," and the "mony canty days" of the "auld lang syne." Then the old Family Bible with its long register of births and deaths is laid on the table, and with dimmed eyes and wrinkled fingers they trace the inspired poetic description of the land they hope so soon to enter, the land to which their ideals have already fled.

The power which created imagination has showered the means for its cultivation. From the hues of sky and earth he who can not write may learn to paint his thoughts with form and color; from the myriad sounds of nature the mute poet may gather the notes which will enable him to express in anthems imaginations otherwise unutterable. The winds whisper a soft lullaby; the brook murmurs a flowing dactyl; the measured tread of the iambic speaks from the rocks and hills; the birds trill a merry roundelay; and the thunder of the cataract, the cloud, and the earthquake are the blank verse in this mighty poem. The ages are rounded into cycles, and the worlds march in measure at the fiat of the Almighty. Holy men inspired by God clothed their imaginations in the most sublime poetry ever written. From the chaotic birth of nature till time shall be no more and human conception falls powerless, the Bible rolls its mighty epic, with the glorious refrain ever and anon bursting from its pages: "Praise the Lord! angels, heavens, earth, the depths! Let all that breathe praise the Lord."

LODOLA.

True philosophy is a revelation of the Divine will manifested in creation: it harmonizes with all truth, and can not with impunity be neglected.

INDOLENCE IN LITERATURE.

PART II.

WE do not say that writers always cease to be conscientiously exacting of themselves in diligence and discrimination, when an approving world kneels at their feet. There are ever a few excellent models for artists to imitate when original genius, or pluck, is wanting. There are heroic workers who, having won the leadership of intelligence, are sensitively alive to the delicate yet grave responsibilities which they feel called upon to engineer. They do not fail to have their lamps trimmed by day, head-lights ablaze by night, and to keep a faithful lookout upon the swift, hastening track that glides under their feet to an eventful destiny. They are determined that no mere carelessness of theirs shall make victims before or behind them. Their convictions are grounded upon infinitesimal analysis; their sentiments are dedicated to unequivocal truth; their imagination is the in-gathering of possibilities from the horizon bounds of spiritual instinct; their poetry is the outleaping of the soul of man to the incomparable richness of external nature; their research is the gathering up of the minute works of God on the common shores of time, where are scattered rock and wreck of incident and accident; their comprehensiveness is the daily work of linking strongly together the extensions of the multitudinous chains of separate philosophies and systems; their philosophy itself is the clipping of ideas from old connections, enlarging them, and transforming them with successively new settings; their humor is imbibed from the ludicrousness of their own and others' blundering acts, the consequent confusion and mortification, and at last the happy *denouement*—for "all is well that ends well;" in short, they make the most of everything, and—*are not afraid of drudgery*. That last item is the pith of the matter. Bridget "would like to dust the arrnamints in the parlhar, but who wud be afther scrub'n the kitchen floorh when they've a moind to be a foine lady?" Bridget's declaration of her sentiments of honor and ambition is a democratic echo reverberating through an aristocratic house.

The writer has not attempted to give a dissertation, by any means, upon the inexhaustive subject of the literary art; but has aimed below the professional critic's mark, believing that here is room for something considerable to be done. There is much to discourage the would-be original thinker—more, perhaps, than the public would willingly acknowledge. He must cleave his lonely way through the thick strata of universal ignorance. His own

> "Outward sense
> Is but of gradual grasp."

Some philosophers claim that the intellect grows while the individual is asleep and unconscious; that the brain accomplishes its most notable work while the body sleeps; that it has short cuts—mysterious, secret—to an idea or plan which the man awake might try a life time to run across, and try in vain. However true, this will not fill the measure of the man who possesses the right to think—even wrong. If he has a spark of self-respect he will not be tempted to deed his soul away to any tramp who walks into it for a night's lodging. Yet he who coins his own thoughts, and discovers his own stars of truth, must have "a self-sustained intellectual might." His servants are not living coadjutors; they are inanimate things and intangible instincts; and it is

critical work to make their relative aptitudes clear. It takes a powerful concentration of mind, and a comprehensive judgment, to see the inner and outer forces—of whatever is under consideration—at once, and to be able to grasp the whole sweep of their relative mutabilities. What makes it most difficult is that the judgment of the writer grows with his work—with his experience—and must fit and furnish itself while it adapts its subjects and objects to each other. It must provide an appropriate time and place for the advent of a new principle, or let "the truth" go by unnoticed, or unheeded, for want of a proper exhibition.

To the people a new idea is like a strange blind man on a public thoroughfare; they can not tell what his pretensions cover. He may be deserving of attention, but caution outweighs the sympathy of a public people. Then, too, extreme originalities are not attractive to an imitative mind; they trench upon what is permissibly in good taste. The imitator seeks something which has an outward glow, something which can be quickly seen through and copied. He abhors the rude, the unpolished, and undeveloped, and prefers superficial brilliancy and dash. He would stick glass beads upon the corners of the evening star to relieve its plainness, or put a lion's head upon a serpent to make it look noble. He too often confounds the rugged and the strong with vulgarity and want of delicacy. There is an old legend that ought to be printed in letters of gold for the present peculiarities of the public: "When the lofty and barren mountain was first upheaved into the sky, and from its elevation looked down on the plains below, and saw the valley and the less elevated hills covered with verdure and fruitful trees, it sent up to Brahma something like a murmur of complaint: 'Why thus barren? Why these scarred and naked sides exposed to the eye of man?' And Brahma answered, 'The very light shall clothe thee, and the shadow of the passing cloud shall be as a royal mantle. More verdure would be less light. Thou shalt share in the azure of heaven, and the youngest and whitest cloud of a summer's sky shall nestle in thy bosom. Thou belongest half to us.'" This legend illustrates the old saying, that "Beauty unadorned is most adorned."

Still, altogether considered, there is a deal of friction under the wheels of new ideas and unproved theories, and the man who devotes himself to truth-speaking, regardless of popularity, finds his "grit" ground to powder before his ideas are taken in and hospitably entertained. But contumely, scorn, or, most discouraging of all, indifference—none of these will close the philosopher's mouth when he has somewhat important to say. Emerson, one of the best of our mental philosophers, warns us that "Man's culture can spare nothing, wants all the material. He is to convert all impediments into instruments, all enemies into power. The formidable mischief will only make the more useful slave." Emerson, it is well known, is one of the most painstaking of writers—one of the soundest. He does not slaughter truth as an offering at the altar of poetic fancy; nor does he write nonsense to please a "mixed audience;" or because Artemus Ward and Mark Twain have succeeded in that line. He does what the majority of writers might imitate to advantage—keeps within his own sphere, and a noble one it is.

But he who observes most closely, examines microscopically, and unfolds entirely to his own gaze the things and thoughts of ever-wonderful life, does not always succeed in giving graphic descriptions. He may excel as a student, but fail—or contrive, painfully—to teach. Yet impatience alone will not hasten the good which he would bring about. "The measure of a master is his success in bringing all men round to his opinion twenty years later." There is faith in that—faith born of an intelligent will. But we digress. The descriptive powers of Byron, Shakespeare, Milton, Dickens, are marvels to the world. Dickens—active, keen-eyed, sympathetic, social Dickens—entices his readers, old or young, shy or curious, into the mosaic heart of London—into Fagin's den of thieves, or some other *hades*, where they can see more of real human nature in a few hours than they would care to encounter in a life-time; and yet every individual is so human—the darkest

characters are rescued from total depravity with such simple fidelity to that hidden bit of "true steel" which awaits the striking against the "flint" to reveal itself—that the reader is half fascinated with the bad company, which excites alternately his horror, his contempt, his pity, and his curiosity, and makes him anxious to be rid of it. Dickens studied his text; selected his brushes, his paints—using the right brush with the right paint—and he applied himself diligently to manipulation.

Shakespeare marshals up his characters as familiarly as if they were his dogs, his servants, and his children; and he knows every whim, every secret passion, or every manly principle that possesses them. And now that we have written it—is it an old expression of our own, or is it a raveling from another's work that we carry off?—Shakespeare's writings were not all genius; in the best of them there was labor—severe, critical, exacting.

Byron—born full fifty years too early, we shall always maintain—played with the finer passions, now as if they were simple toys; then as if they were brilliants, flashing them in the light for beautiful effects; and again, with a most thrilling appreciation of their holiness. Here is his picture of the breaking heart, familiar to the many—the poetry we mean, not the breaking heart—but there will be new readers ages hence for Byron's true poetry:

"They mourn, but smile at length; and, smiling, mourn:
The tree will wither long before it fall;
The hull drives on, though mast and sail be torn,
The roof-tree sinks, but moulders on the hall
In massy hoariness; the ruined wall
Stands when its wind-worn battlements are gone;
The bars survive the captive they inthral;
The day drags through though storms keep out the sun;
And thus the heart will break; yet brokenly live on."

We venture to say that no poet ever held commune with Nature with such rapt utterance—so reverent, and yet familiar—as Lord Byron. We have read again and again the description of a thunder storm in "Childe Harold's Pilgrimage," third canto, beginning with the ninety-second stanza. It always excites the same emotions, as if it were being read for the first time:

"The sky is changed!—and such a change! Oh night,
And storm, and darkness, ye are wondrous strong,
Yet lovely in your strength, as is the light
Of a dark eye in woman! Far along
From peak to peak the rattling crags among
Leaps the live thunder! Not from one lone cloud,
But every mountain now hath found a tongue,
And Jura answers, through her misty shroud,
Back to the joyous Alps, who call to her aloud!"

The four stanzas following increase in interest; but having no space for them, we content ourself with quoting the ninety-seventh. After the poet has been witnessing the commotion of the various elements, he then breaks out:

"Could I embody and unbosom now
That which is most within me—could I wreak
My thoughts upon expression, and thus throw
Soul, heart, mind, passions, feelings, strong or weak,
All that I would have sought, and all I seek,
Bear, know, feel, and yet breathe—into a word,
And that one word were Lightning, I would speak;
But as it is, I live and die unheard,
With a most voiceless thought, sheathing it as a sword."

These words are not fluid as *lightning*, but they dart, flash, strike, pierce, burn—are roundly charged with electricity. It is a tremendous volcanic explosion, followed by the softly-whispering voices of nature.

Words are the common soldiers of expression, and need a good commander. They are grotesque figures dancing to a dare-devil tune. They are miscellaneous blocks waiting for the architect to choose and fit them to each other. They are taste—nectarine, acidulous, bitter. They are perfumes—aromatic, fragrant, or disgusting. They are tones—melodious, passionate, sad, exultant, grand, awful. They are colors capable of high effects—from the sublime and grandiose to the cool, the clear, and soothing; but not every one who lays them on the canvas can produce a picture. Kaleidoscopic by reflection, they are infinite in variety of forces, shapes, and beauties. Pure, simple, and unostentatious of their single selves, they mass together in all the regal pomp of power, in unique groups of personal displays, and yet what senseless jargon do they often make! How they can glare, and smile, and smite, and frown, and chant, and howl, and damn, and bless! The fiends and the angels abide in them. They are living ghosts. They stand before us in

their palpable presences, and yet we can not see which way they have come, nor whither they are gone. We can not measure their powers of good, nor their propensities to evil—their friendship, nor their malignity. Language, like society, admits freely of caste. Glitter and ornament, taste, and startling mode prevail, as in the world of fashion. How carelessly words are plucked and flung about, as blades of grass or grains of sand. It is this prodigality—this total lack of knowing, or caring to know, the value of words, and thoughts, and things, and conditions, and truths—that keeps us poor in literature, with all our stores of books and tons of newspapers and other periodicals. "Words—words—words!" The idea is oftener with "the needle in the haymow," or in the monkey-cup on the desert. The kine or the monkeys may find and utilize it; but superficial man can get on in the world without it, if he only *seems* to have it.

In the ruder walks of nature man admires —then craves. But he beholds the noblest genius, and self-denyingly says, "It is not for me!" Is it his modesty blushing for its innocence? Is it awe, humbled for self-contrasted littleness? Is it ignorance mistaking a noble, loving woman, or a grand, intellectual man, for a piece of dumb, cold statuary? No; it is indolence, contented to be discontent, that coolly declares, "It is not for me."

But if we wonder at Shakespeare, Dickens, Milton, Byron—at their acute perceptions, their swift and strong analogies, their individual projective energies—how much more may we open our astonished eyes at the slow atomic research, the close, confining application, the unswerving determination that inhere in the composition of great scientific explorers, who bury themselves in, and imbue themselves with, dry, abstract studies that would seem to freeze the warm humanities out of the student, by their cold, breathless inanimation—their uncommunicativeness. But look at Humboldt—what a humanitarian! After all our fear of their fossilization, we find that many of these philosophers are either criticising or creating "other worlds than ours;" and in the meantime they eat beef and increase posterity, thus getting as full a grasp of the common accomplishments, and, beside these, what we consider a stupendous surplus of intelligence. While it is astounding to the average mind how they pack away so much knowledge, with such systematic arrangement, that it is ever ready for use, they—the learned, the laboring, and unconquerably ambitious—are far more "at sea" to know how we *manage* to live such empty, vague, and unconscious lives—how our minds can be so utterly blank, unimpressionable, and stagnated. They can fathom any depths easier than our shallowness. It should strike home to us forcibly, convictingly, when we observe what the human intellect has evolved, the wide scope of knowledge over which it has swept, and into which it has merged itself, and the treasures which it has garnered in the few individuals of whom we boast as the "great men" of our times. There can be nothing so incomprehensible as our apathetic disregard of the magnitude of life, our indifference to concrete truth, our dull estimate of the fitness of the tools with which we work when we do work, and our irresponsible tutelage over the mind which makes the man. Hear what Tennyson says:

"Come, my friends,
'Tis not too late to seek a newer world.
Push off, and sitting well in order, smite
The sounding furrows; for my purpose holds
To sail beyond the sunset, and the baths
Of all the western stars, until I die.
It may be that the gulfs will wash us down:
It may be we shall touch the Happy Isles,
And see the great Achilles, whom we knew.
Tho' much is taken, much abides; and tho'
We are not now that strength which in old days
Moved earth and heaven; that which we are we are;
One equal temper of heroic hearts,
Made weak by time and fate, but strong in will
To strive, to seek, to find, and not to yield."

ROSINE KNIGHT.

THADDEUS STEVENS AS A STATESMAN.—One who knew this eminent man well, says that as the leader of the Republicans in the House of Representatives, he was unrivalled. He tolerated no disaffection in his ranks. He permitted no divided allegiance. And the awe and dread which members manifested of him, of course contributed to

his success as a party leader, though it was amusing to those of us who knew him better. To the House he appeared like the fourth form of the prophet's vision—dark, mysterious, iron-teethed, terrible—while by nature he was one of the gentlest and most genial of men, with an overflowing sympathy for all in distress, and whose appeals he could never resist. There was, perhaps, no public man in Washington more easily approached. Men, women, and children went to him freely to consult him, and were always sure of a sympathetic hearing. But in the House he seemed like a man of iron.

YALE COLLEGE AND ITS PRESIDENT.

YALE College ranks as the second educational institution in age and importance in this country. Its age may be stated as 177 years, counting from the time when ten of the foremost ministers in the Colony of Connecticut assembled at New Haven and formed themselves into an association for the purpose of founding a school. These gentlemen subsequently repaired to Brandford, each taking a number of books, and depositing them there with the view to form a library. It was in 1701 that this Society was incorporated by colonial statute. Several years passed before the school had fairly set out upon a useful course. Abraham Pierson was the first Rector. He died in 1707. Only a few years ago, a bronze statue to his memory was erected in the College grounds.

The Society School was located first at Saybrook, but during its first seventeen years it led a wandering life. Rector Pierson lived at Killingworth, and taught his class there. The Rector who succeeded him resided at Milford, where he instructed the senior classes, while the lower classes were instructed at Saybrook. In 1716 many of the students left Saybrook and went to Weathersfield, to be taught by Mr. Elisha Williams, whose tutorage they preferred, and who nine years afterward became Rector. Much controversy with regard to the location of the College was maintained between New Haven, Hartford, Saybrook, Weathersfield, and Middletown, and this affected its financial condition and progress.

In 1717 most of the trustees having declared in favor of New Haven, the young College was removed thither, but not without much opposition on the part of the citizens of Saybrook. About this time there were received from London a large box of books, a portrait of King George, and some valuable English goods. These were the gift of Governor Elihu Yale, of London, and in acknowledgment of the gift, the trustees named the new building, which had been erected for the use of the school, "Yale College." This Elihu Yale was born in New Haven in 1648, but was educated in England, and spent the greater part of his life there and in the East Indies, occupying in the latter important official positions. His portrait is on the cover of the *Yale Literary Magazine*.

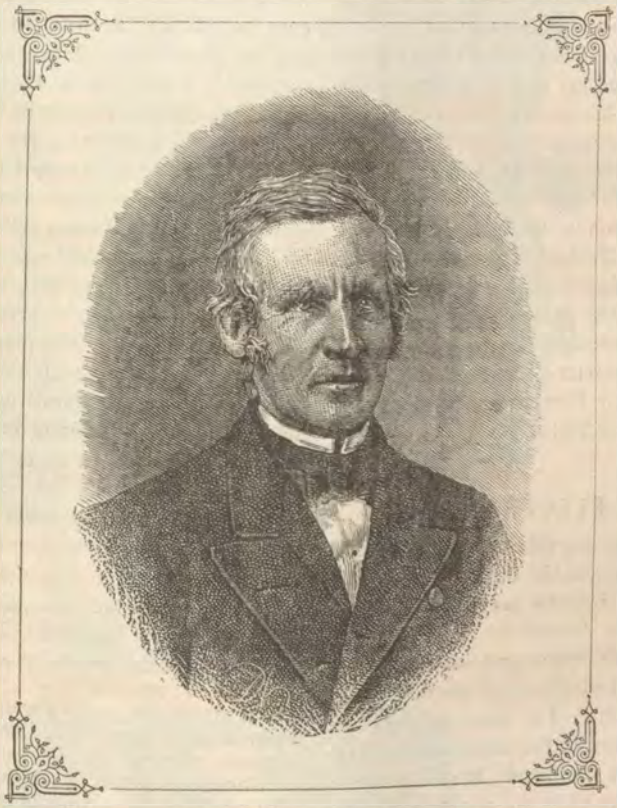
The settlement in New Haven proved the beginning of a new and advancing career. One by one departments of study were added and new buildings erected, and a substantial basis of reputation created. During the Revolution, however, the College was nearly broken up. No public Commencement was held from 1777 to 1781; but with the close of the war, matters resumed the old shape, and with the accession of President Timothy Dwight in 1795, the College entered upon a career of prosperity which has scarcely known a drawback since. From the school attended by less than 150 pupils, and tutored by a half-dozen teachers, it has become a University with six separate Faculties, numbering in the neighborhood of 90 instructors, nearly 1,100 students, and occupying thirty buildings. President Dwight evinced remarkable administrative energy; and to his skillful management the remarkable growth of the institution was mainly due.

Succeeding his occupancy of the President's chair was Jeremiah Day, who for twenty-nine years exercised a wise sway;

next came Theodore Dwight Woolsey, who resigned, on account of age, in 1871, and was succeeded by Dr. Noah Porter, whose portrait is given.

THE PRESIDENT.

Noah Porter is the second son of the Rev. Noah Porter, an eminent divine, and a life-long pastor of the Congregational church. He was born in December, 1811, at Farmington, Ct., entered Yale College as a student at the age of sixteen, and was graduated in due course. His father was also a graduate of the same institution. After leaving college, young Porter gave his attention to teaching, accepting a situation in the Hopkins Grammar School of New Haven, where he taught two years. From that the transition seemed easy; and for the succeeding two years he was employed as a tutor in his *alma mater*. Having made choice, however, of the Christian ministry as his vocation, he was settled as pastor over the Congregational church in New Milford in April, 1836, and remained in that connection until 1843, when he accepted the call to Springfield, Mass. Four years later, having been elected to the chair of Moral Philosophy and Metaphysics in Yale, he removed to New Haven, and entered upon the duties of his professorship. This position afforded him opportunity to win reputation as a scholar and author; and upon the resignation of Dr. Woolsey, he was elected to fill the vacancy by the unanimous vote of the College Corporation. During the twenty-five years of his professorship, he contributed to periodicals of the day, and published several volumes of recognized value. He assisted in the preparation of a new and revised edition of "Webster's Dictionary," a work which involved a vast amount of careful research. He wrote "Puritan and Jesuit Education," "The Human Intellect," "American Colleges and the American Public," "Books and Reading." His "Human Intellect" is a ponderous tome, representing the study and labors of many years. It is a compendium of ancient and modern mental philosophy, furnishing views of the opinions entertained by the long array of metaphysicians from the time of Anaxagoras to our own day. It is valuable as a work of reference to all who are interested in metaphysical research. The attitude taken in it by Dr.



THE OLD BUILDINGS OF YALE COLLEGE.

Porter toward Phrenology has received attention from advocates of the science, and discussions of it have occurred in the PHRENOLOGICAL JOURNAL.

The portrait herewith given was engraved from a photograph taken about two years ago, and represents Dr. Porter as a man of much nervous energy and physical endurance. The whole physiognomy wears an expression of intensity, of the habit of close and thorough thinking, but more in the direction of the theoretical than of the practical. He has much talent as an organizer; is ready in suggestion, and his plans always have a basis of utility and economy. He is not the man to entertain unnecessary and extravagant projects which would require time, money, and labor in their prosecution. He is strong in will, steadfast in opinion, and inclined to be brief in oral statement. Although argumentative, he is not wordy, but seeks to convey his thoughts in a direct manner, using the exact terms which fit his meaning. As a reasoner, his organization and studious habits dispose him to a preference for deductive methods, in which he should be distinguished for nice discrimination as well as deep penetration.

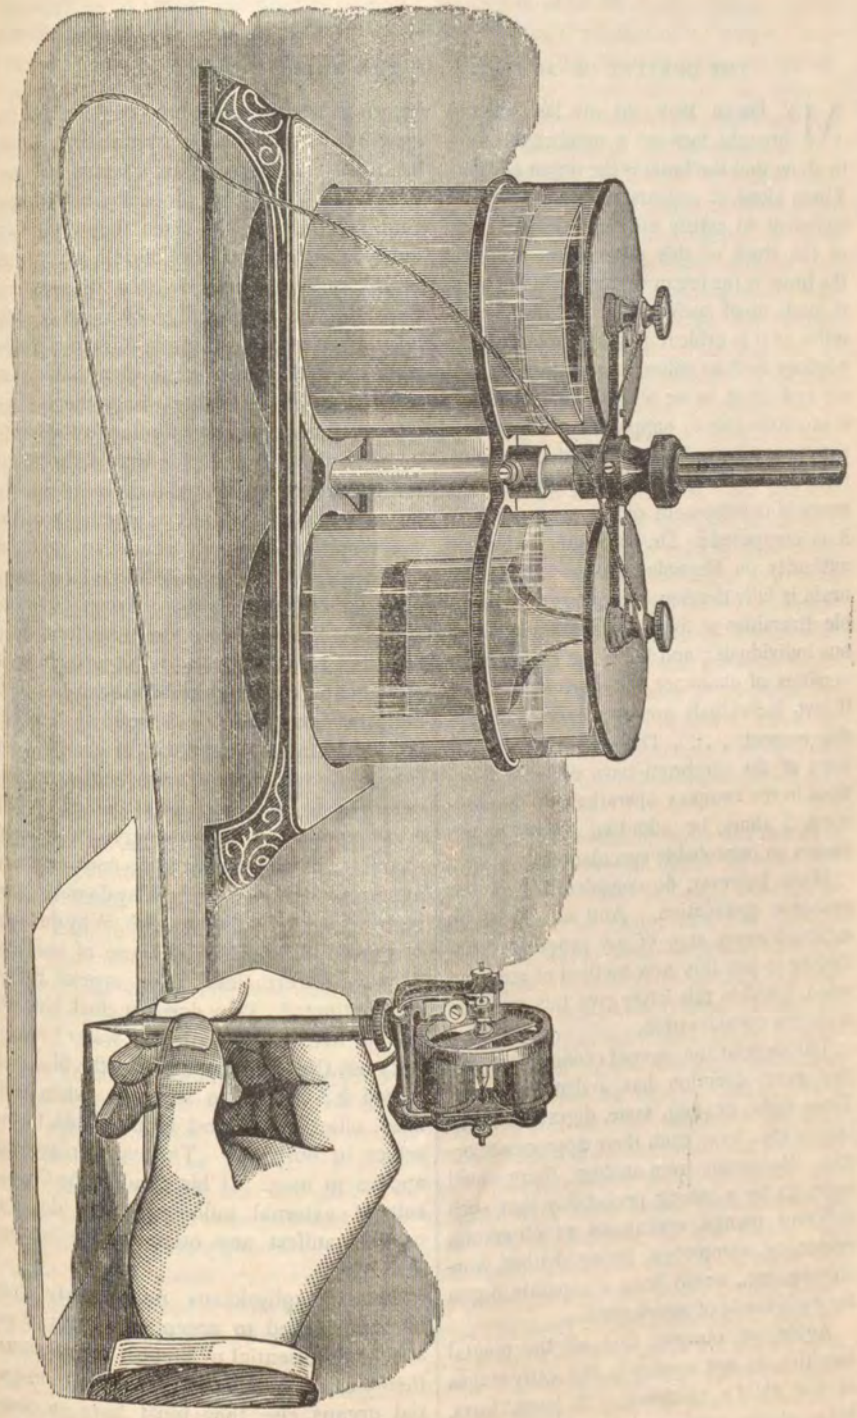
He is a strong character, mingling elements of robust energy with a fine esthetic taste and much sympathetic feeling.

Some of the buildings within the Yale College domain worthily represent the interest of wealthy Americans in the cause of higher education—such, for instance, as the Peabody Museum, which was endowed by Mr. George Peabody; the Yale School of Fine Arts, which was the creation mainly of a single donor, Mr. Augustus R. Street, of New Haven; the Sheffield Scientific School, with its two attractive halls, which owes its existence to the liberality of Mr. Joseph E. Sheffield, of the same city. Then there are the new Library Buildings, the School of Fine Arts, Farnam Hall, and Durfee Hall. This last was completed in 1871.

and perhaps its architecture possesses the most agreeable proportions of any to the eye of a visitor. It is constructed of rough-dressed New Jersey sand-stone, is four stories high, and arranged for dormitory purposes. The value of the land and the various sums which have been expended for building purposes by the Corporation would make up, it is said, an aggregate of scarcely less than five millions of dollars. The productive property of the University, according to the last report, was put at one million five hundred thousand

Yale College ranks well in respect to her record of students who have become distinguished in literature, science, and politics. In letters, she can point with pride to Webster, Worcester, Woolsey, and Hadley; in science, to Silliman, Morse, Whitney, and Dana; in divinity, to Edwards, Hopkins, Dwight, and Taylor. The celebrated class of 1837 has furnished more men of prominence than any single class graduated by any other institution in America; among them are Secretary Evarts, Chief-Justice Wait, Minister Pierrepont, Professor Silliman, Governor Tilden, etc.

THE ELECTRIC PEN.



THE advancing tide of civilization constantly swells the throng of busy men whose chief business seems to be to respond to the demand for more facilities, more dispatch, more agencies, to promote the industrial energy of the working, thinking community. The printing press, the electric telegraph, the steam engine have ceased to be wonderful; fresh discoveries and inventions claim our attention day after day, and some possess so remarkable a degree of mechanical utility, usurping even the place of man's intelligent hand, and eclipsing it in the perfection of result, that we are led often to ask, What next?

The engraving presents a view of a recent invention, called the Electric Pen, which adapts the singular energy of electricity to common uses. It is the production of Mr. Edison, a well-known electrician, a sketch of whose career will be given in the January PHRENOLOGICAL. As shown in the engraving on page 429, the Electric Pen consists of a small electro-magnetic engine mounted upon frame-work secured to the top of a tube, pointed at the end. Within the tube is a needle, secured to the end of a shaft, which is given a very rapid vertical revolution by cams upon the rotating engine shaft. The pen when in use is held in the vertical position, upon a sheet of writing paper placed upon a thick blotter or some other soft, slightly yielding substance, and a letter may be written with the same ease and facility as with an ordinary pen, but the characters will be composed of innumerable punctures in the paper by the rapid projection of the needle from the tube. The result is a perfect paper stencil. The motive power used to propel the engine of the pen is derived from a voltaic battery, consisting of two Bunsen cells. A particular form of this battery was especially designed for the electric pen, with a view to economy and its use by persons inexperienced in electricity. The press consists of a metal base upon which the sheet to be printed is laid. A frame operating upon hinges and having springs for securing the stencils in position, is brought down upon the bed of the press. A roller saturated with printer's ink somewhat thinned with oil, is passed over the stencil plate, filling the holes of the stencil, percolating through upon the paper, and thus giving a perfect fac-simile of the original. This process is repeated until the requisite number of impressions is obtained.

The apparatus meets a want felt by many business and professional men who have occasion to send out letters in duplicate, circulars, and copies of writing of any sort.

In nearly all departments of business, the sciences, arts, education, etc., it can be made to render valuable assistance, saving both time and money. The Post-Office department has decided that everything written with the electric pen shall go as third class mail matter at one cent per ounce or fraction thereof. The cost of running the apparatus, including ink, etc., will not exceed ten cents per week. Anything that can be done with an ordinary pen may be readily accomplished with this, and hence it is equally well adapted to all trades and professions.

We are indebted to Mr. George H. Bliss, of Chicago, for the use of the engraving.

THE ELECTRIC PEN.

LETTERS TO A SON IN COLLEGE.

No. IX.

THE COMPLEX ORGANIZATION OF THE BRAIN DEMONSTRATED.

MY DEAR BOY: In my last letter I brought forward a number of proofs to show that the brain is the organ of mind. These alone, it appears to me, ought to be sufficient to satisfy any unprejudiced mind of the truth of this proposition. If, then, the brain is the organ of mind, and the mind is made up of such various and diverse faculties as it is evident it must be in order to produce such an unlimited variety of character and talent as we observe among men, is it unreasonable to suppose that the brain is a compound organ, and that these characteristics have their origin in different degrees of development of the parts of which it is composed? Dr. Carpenter, a leading authority on Physiology, says: "When the brain is fully developed, it offers innumerable diversities of form and size among various individuals; and there are as many diversities of character. It may be doubted if two individuals are ever exactly alike in this respect. . . . . That the different portions of the cerebrum have different functions in the complex operations of thought, must, I think, be admitted to be by no means an improbable speculation."

Many, however, do consider this an improbable speculation. And as I wish to establish every step of my progress in unfolding to you this new method of studying mind, I will in this letter give this question a careful consideration.

Throughout the animal economy we find that every function has a distinct organ. Thus sight, hearing, taste, digestion, circulation, etc., have each their appropriate organ. Reasoning from analogy, there would seem to be a strong probability that such different mental operations as observing, reasoning, comparing, loving, hating, worshiping, etc., would have a separate organ for each mode of manifestation.

Again, we observe that all the mental faculties do not appear in the early stages of the child's existence. It loves, fears, hates, shows anger and determination long before it reasons, or has any feelings of veneration or moral accountability. If the brain were a single organ, it would be capable of manifesting all these mental faculties simultaneously. But since they appear at different stages of the child's growth, it would seem to indicate that the brain is composed of a plurality of organs, each adapted to a different mode of mental manifestation. Perhaps some may think that the successive appearing of the mental faculties in childhood gives color to the favorite metaphysical doctrine that all men are created equal, and that the different characteristics which we observe among them are the result of training, education, and the circumstances in which they have been placed. Helvetius says: "Foxes hunt because they have learned hunting from their parents; birds sing and build nests in consequence of instruction; and man becomes man by education." Spurzheim replies: "Were animals susceptible of change from every impression, and not endowed with determinate natures, how comes it that every species always preserves the same character? Why do not fowls coo when they are raised with pigeons? Why do not female nightingales sing like males? Why do birds of one kind, hatched by those of another, display, nevertheless, their special habits and instincts? Why does the duck hatched by the hen run toward the water? Why does not the cuckoo sing like the bird that reared it? Why do squirrels, when pursued, climb trees, and rabbits hide themselves in burrows? The same reasoning applies to man. If his faculties be the result of external influences, why does he never manifest any other nature but his own?"

The metaphysicians must surely have been compelled to accept this doctrine as absolutely essential to support their favorite theory of the mind's independence of material organs, else they must have so completely shut up the organs of sense, shut out

the material world, and shut in the mind upon itself as to render themselves blind to facts which are patent to the most careless observer.

Again, Dugald Stewart says: "What we call the power of imagination is not the gift of nature, but the result of acquired habits, aided by favorable circumstances." And others have asserted that genius is the result merely of an accidental exciting cause. As illustrations of this, it is said that Newton was made a philosopher by the fall of an apple, and Byron became a great poet because he was lashed by the reviewers and condemned as a poetaster. "But," says Mr. George Combe, "like causes produce like effects, and how happens it that so many millions before Newton had seen apples fall without ever thinking of anything but picking them up and eating them? And if lashing be sufficient to produce a great poet, why are not great poets more numerous? Indeed, if critical abuse had been sufficient, I should by this time have become a great poet myself."

The early lives of thousands of celebrated men entirely refute this doctrine of equality in mental gifts, and that excellence in any pursuit or branch of knowledge is the result of acquired habits aided by favorable circumstances. Allan Cunningham, in his "British Painters," says, in reference to Richard Wilson: "His love of art appeared early. How this came upon him in a place where there were no paintings to awaken his emotions, we are not informed; but a slight cause will arouse a naturally strong spirit."

Mozart composed music at the age of six. Michael Angelo exhibited remarkable talent at the age of thirteen. George Moreland made drawings at the age of five years, which obtained a ready sale at high prices. And Pascal and Bidder were profound mathematicians when mere children.

These special talents must certainly be innate when they appear at so early an age, and are often manifested so powerfully under the most unfavorable circumstances. And if they reside in the brain, as they certainly must, since the brain is the organ of mind, how is it possible for the brain to be a single organ? Would it not in that case be able to manifest equally talents for music, painting, mathematics, poetry, etc.? But how easily are these phenomena explained on the supposition that the brain is composed of a plurality of organs, each of which is adapted to the manifestation of a distinct faculty, and which, being subject to the laws of hereditary descent, like the other bodily organs, are often transmitted from parents to children in such strength and vigor as to spring forth spontaneously into activity, entirely independent of training, education, and favorable circumstances.

Now in regard to the hereditary transmission of mental qualities, I would like to know how it is explained by those metaphysicians who teach that the mind never operates through the agency of any material organ whatsoever. If the mind is perfectly independent of bodily organs, then these talents must be located in the soul itself, and we are compelled to think of an immaterial principle as divided up into various parts, talents, feelings, and passions, which exist in different degrees of strength, and which, as parts of the immortal mind, are handed down from parents to children, like the gross and material substance which they inhabit.

Dr. James Carson presents this matter in a clear and powerful light. "Every person," he says, "who is a close observer of nature, must be aware that the children often very closely resemble either father or mother, or are a mixture of both, not only in the features of their face, and in the organs generally of the body, but also in what is called their mental constitution, such as may be seen in their temper, talents, tastes, passions, and peculiar modes of thought. Now if idiocy, proclivity to crime, a tendency to insanity, temper, tastes, passions, and talents are handed down from parents to children on the side of *both father and mother*, and if these things are all in the mind in place of the body, it must follow that the mind itself is hereditary. Just see the position my opponents are placed in by such a state of matters! They are compelled to believe that the mind is transmitted by the parents as well as the body

Nay, more, inasmuch as the child often partakes of what is called the mental peculiarities of both father and mother, the mind must be composed of distinct and different parts, some of these derived from the father and some of them from the mother. Surely this is materialism with a vengeance. For my part I can not believe that the mind or soul is derived all from the father, or all from the mother, or a part of it from each. I am satisfied that the body alone is transmitted, and that the soul, in every instance, is a new creation from the hand of the Omnipotent."

In my last letter I remarked that when the brain is below a certain size, idiotism is the invariable result. But some idiots, completely deficient in every other particular, are remarkable for manifesting some special talent in the most powerful degree. Fodéré, in speaking of the Cretins, says: "It is remarked, that by an inexplicable singularity, some of these individuals, endowed with so weak minds, are born with a particular talent for copying paintings, for rhyming, or for music. I have known several who taught themselves to play passably on the organ and harpsichord; others who understood, without ever having had a master, the repairing of watches and the construction of some pieces of mechanism." He adds that these powers could not be attributed to intellect, "for these individuals not only could not read the books which treated of the principles of mechanics, but they were confounded if spoken to on the subject, and never improved themselves."

Mr. Combe speaks of an idiot who had such a faculty for acquiring languages, that if shown a passage in the Bible, she would point out and read the corresponding passage in seven or eight different languages, though the words were wholly without meaning to her mind. He also gives an instance from Pinel of an idiot who manifested the most wonderful propensity to imitate whatever she heard or saw, but who was utterly destitute of intellectual capacity, and who never attached an idea to any sound she uttered. And another from Dr. Rush, of a man who was remarkable for his religious feelings, though exceedingly deficient in intellect and other moral qualities. Mr. Schlatter informs us that "the celebrated painter of cats, named Mind, of Berne, was an idiot in the fullest sense of the word, and was altogether childish in his manners. Yet he had such a great tendency and talent for painting from his youth upward that he represented in various pictures, large and small, his numerous favorites, of both sexes, of every age, in every possible attitude and action, with the most striking effect, completely true to nature in their forms, proportions, and colors."

Now in these cases of partial idiocy, if the brain be a single organ, how are we to account for the fact that it is capable of manifesting particular faculties of mind most accurately and powerfully, while in regard to all other faculties it is perfectly idiotic. Such a supposition is about as reasonable as that an eye which is capable of seeing a horse accurately, should be perfectly unable to distinguish a cow, a tree, a house, or any other object in nature. Whatever power the eye possessed, it would be equally capable of manifesting on all these objects. If it were blind to one, it would be blind to all, and if it saw one clearly, it would be able to see all the others with equal distinctness. So if the brain, as a single organ, is all concerned in every mental manifestation, it surely ought to be able to manifest every mental faculty with equal power. And it would be utterly impossible for any one to manifest a talent for music, painting, drawing, mechanics, or mathematics, and be wholly deficient in every other mental faculty. Fodéré calls the cases of partial idiocy which he observed among the Cretins, inexplicable singularities. On the supposition that the brain is a single organ, or that the mind never operates through the agency of any material organ whatever, they certainly are altogether inexplicable. But how simple and reasonable becomes their explanation on the supposition that the brain is composed of a plurality of organs, each appropriated to the manifestation of a single mental faculty. When each acts perfectly independent of the rest, it is possible that some may be completely developed, and thus capable of manifesting their peculiar

faculty powerfully, while others are in such a rudimentary condition as to be unable to manifest mind in any perceptible degree.

Arguments for the plurality of organs in the brain, similar to those adduced from partial idiocy, may be found in monomania or partial insanity, where one or several mental faculties are deranged, while all the others are normal in their manifestations. If the brain as a whole is essential to the manifestation of every mental faculty, the question again recurs, How is it possible that it can manifest correctly every faculty but one, two, or three, and yet be insane upon those particular faculties? That such cases are common, no one in any degree acquainted with the different phases of insanity will dispute. "Hospitals for the insane," says Pinel, "are never without some examples of mania marked by acts of extravagance or even of fury, with a kind of judgment preserved in all its integrity, if we judge of it by the conversation. The lunatic gives the most just and precise answers to the questions of the curious; no incoherence of ideas is observable; he reads and writes letters as though his understanding were perfectly sound, and yet, by a singular contrast, he tears in pieces his clothes and bed-covers, and always finds some plausible reason to justify his wandering and his fury. This sort of mania is so far from rare that the vulgar name of *folie raisonante* has been given to it."

Lord Erskine mentions a case in which a monomaniac brought suit against his brother for confining him in a lunatic asylum. He answered the questions put to him with such perfect accuracy, that all who heard him were fully convinced of his sanity, and believed that he was the victim of cruelty and oppression. At last he was asked if he was Jesus Christ. He immediately replied: "I am the Christ." This, of course, was sufficient to prove his insanity. A similar case is related by Gall.

Dr. James Carson quotes the case of a man who had an irresistible propensity to kill his wife at the very time that he was warning her to flee out of his reach. And of another where a man seemed discreet and could converse on any subject most rationally till the moon was spoken of. On hearing the moon mentioned, he fell into a state of great excitement, as he believed he was secretary to the moon.

These cases of partial insanity, like those of partial idiocy, are most clearly explained on the supposition that the brain is composed of a plurality of organs, while upon any other hypothesis they are altogether inexplicable. Taking again an illustration from the external senses, we find that sight, hearing, taste, smell, feeling, and motion have each separate organs, which are connected with different parts of the brain by means of distinct nerves. If any one of these nerves be severed in any portion of its course, the peculiar faculty over which it presides will be completely destroyed, while every other faculty may remain unimpaired. Sever all of these nerves, and communication with the external world will be entirely suspended. Sever a portion of them, and, as in the case of Laura Bridgeman, the deaf, dumb, and blind girl, impressions from the external world may be received through those organs which remain unimpaired. Some of these organs may also be diseased, then, though their functions may not entirely be destroyed, yet will they be affected in a degree proportioned to the extent of the disorder in the organs. If an eye be jaundiced, everything which it sees will be tinged with yellow. If it be weak from any cause, we can not hope to have perfect vision till this organ shall have been restored to health and strength.

Cases are on record of individuals having lost the power of feeling while retaining that of motion. These functions are presided over by different nerves, which, for a portion of their course, run in the same sheath, and can not be separated or distinguished, yet their powers are totally different. A woman having lost the sense of feeling, while retaining that of motion, was able to carry her child in safety so long as she looked to what she was doing, but the moment her attention was withdrawn from her child, it fell to the floor, as there was no sense of feeling to remind her that she had anything in her arms. A waiter similarly affected could carry her tray in safety so long as she

looked to her hand, but the moment her eye was withdrawn, the tray fell to the floor. In these cases sight compensated, though very imperfectly, for the want of the sense of feeling.

These external senses, as I have before observed, are each presided over by distinct nerves, which have their origin in different parts of the brain. That the brain is essential to the manifestation of these different functions, is proved by the fact that if the nerves which connect it with the external organ are severed in any portion of their course, the function of the organ is completely destroyed. If, then, different parts of the brain preside over such diverse functions as sight, hearing, taste, smell, and feeling, in so far as the senses are concerned, it must be a compound organ, and is it any more unreasonable to suppose that it may have individual organs for the manifestation of such different talents and dispositions as we observe among men?

Let us now, in contrast with this simple and natural method of explaining the complex phenomena of mind, consider the hypotheses upon which the metaphysical systems of mental philosophy are founded, and trace them to their legitimate issues. Nothing is more clearly taught by the metaphysicians than that the mind is made up of many different powers—as reflection, imagination, will, judgment, feelings, passions, etc.

On the supposition that the mind never operates through the agency of any material organ whatever, we are compelled to locate these various faculties in the mind, which we have been taught to regard as an immaterial entity. Think, then, of an immaterial spirit being divided up into parts. Think of some of these parts becoming deranged while all the others remain in a healthy condition. Think of all of these becoming obliterated but one, whose manifestation is unusually healthy and vigorous. Think of this spirit becoming exhausted and requiring regular periods of sleep to restore its wasted energies. Think of it becoming drunk, or reduced to a state of stupor by different material substances. Surely these states and conditions, to which the metaphysical doctrine makes the spirit or soul of man subject, wholly contravenes our notion of spirit, and does away entirely with the soul's immateriality and immortality. For it is utterly impossible that that which is immaterial and immortal may be divided into parts, become diseased, exhausted, intoxicated, or put into a state of sleep.

The materialist, Priestly, very naturally drew a powerful argument in favor of his doctrine from this hypothesis of the metaphysicians. "We see," said he, "that every faculty of the mind, without exception, is liable to be impaired, and even to become wholly extinct before death. Since, therefore, all the faculties of the mind, separately taken, appear to be mortal, the substance or principle in which they exist must be pronounced to be mortal too."

Under the hypothesis that the mind never operates through the agency of any material organ whatever, Priestly is unanswerable. But on the supposition that the brain, as the organ of mind, is divided into many individual organs, each adapted to the manifestation of a single faculty, this argument for materialism falls to the ground; for then we may refer the deficiency, the disease, the exhaustion, and the intoxication to the material organ, and consider the mind as an immaterial and immortal entity, giving forth a corresponding manifestation. Complexity, then, certainly is somewhere, and we are compelled to locate it either in the mind or the body. Which is the more rational view, I think the foregoing considerations will enable you rightly to determine.

But, say the metaphysicians, when we speak of the mind being made up of many faculties, we do not wish to be understood that it is divided up into as many parts as there are different mental faculties. We mean by a faculty only the mind itself existing in a certain state. But this doctrine of the mental states, while it is intended to do away with the absurdity of supposing an immaterial entity divided up into parts, projects us into equally as great an absurdity, and leaves the complexity which mind everywhere presents wholly unexplained; for the questions still recur: Why is the same mind invariably strong in one particular state and

invariably weak in another? Why is the monomaniac insane in one state, and sane in every other? Why does the partial idiot in one particular state manifest extraordinary power, while in every other state he is invariably an imbecile? Surely it is most absurd to suppose that the mind can be jumping about from a state of weakness into a state of strength; from a state of sanity into a state of insanity; from a state of weakness into a state of extraordinary power. And when we consider the various feelings of joy, fear, hope, love, hatred, etc., which sometimes take possession of our minds, and for a time keep them in a turmoil of feeling and passion, we marvel that even a spirit should possess the agility to keep time with our quickly changing thoughts and emotions. For as these thoughts and feelings depend on the whole mind existing in certain states, no two distinct feelings, such as love and joy, anger and hatred, can exist in the mind at the same time. It must jump out of a state of love before it can jump into a state of hope or joy, and it must clear itself from a state of anger before it can experience the feeling of fear or hatred.

Who, upon reflection, will not say that it is contrary to his experience that but a single feeling or emotion can exist in his mind at once. Is it not true that while held under the dominion of some master emotion, such as anger or terror, our minds may at the same time be agitated by many other conflicting thoughts and emotions? The doctrine of the simple mind and a complex brain again meets the requirements of this case completely, for upon this theory several mental organs may be active at the same moment, and their several peculiar influences will be made manifest through the same simple and indivisible mind.

This idea of the mental states appears to me to have been adopted by the metaphysicians not because of its conformity with nature, but because it is absolutely essential to preserve the appearance of consistency among their doctrines. But that it is not safe to build upon any other foundation than the truth, is abundantly shown in the inconsistencies which abound in the writings of the metaphysicians. Dugald Stewart, who held that all men are created equal, and that the difference which we observe among them are the results of training, education, and the circumstances in which they are placed, says: "It is generally supposed that of all our faculties memory is that which nature has bestowed in the most unequal degree on different individuals." Holding also to the doctrine of the mental states which we have just been considering, he inquires: "What is the state of the mind in sleep? Or, in other words, what faculties then continue to operate, and what faculties are then suspended?"

Comment upon these quotations is unnecessary. I will simply say that these learned men are accustomed in their investigations to dive so deep as often to fail to see truth when it lies upon the surface; and that they sometimes forget themselves and talk in a language which is intelligible to the common run of men, and which coincides with common experience.

Dugald Stewart's question in regard to the faculties which operate and are suspended during sleep, is inexplicable upon any metaphysical hypothesis. But on the supposition that the mind operates through a plurality of organs in the brain, the explanation of the phenomena of dreaming becomes as clear as the light of day. For then these organs, acting independently of one another, some may be under the influence of sleep while others are awake and capable of forming pictures in the mind, or following out a train of thought, either rational or absurd, which we are capable of recalling when we wake.

I hope I have brought forward sufficient facts and arguments to establish the proposition which I set out to prove at the beginning of this letter, that the brain is made up of as many different organs as there are distinct mental faculties. If I have done so, the next question to be settled is, What are these organs and faculties?

Affectionately yours,

PATER CONFIDENS.

EVERLASTING.

Dear little, pure little, white Everlasting!
Fragrant, gold-hearted, rose-modeled ye gleam,
Starlike 'mid grasses and mosses, contrasting
Brightly with wild purple asters, and seem
Lovelier far than pink eglantines growing
Yonder, or gay-spotted lilies that burn
Flame-like anear, or the wild roses glowing,
Blushing and paling amid the sweet fern.

Fringing the banks of the brooklet, and raising
Beautiful white-petaled clusters beside
Cardinal blossoms with scarlet-fire blazing,
Empress of wild blooms in color and pride.
High on the lichen-flecked cliffs near the ocean,
Where the red columbine fearlessly dwells,
Blending with golden-rod, ever in motion,
Fanned by salt breezes, ye thrive, *Immortelles*.

Modestly lifting your bright eyes to heaven,
Heedless of sumachs which crimson and bend
Passionate glances upon you, or even
Burning love-kisses of sunbeams, which tend,
Innocent darlings, your beauty to heighten—
Gems of the valley, of wild sylvan dells—
Mossy-green, vine-braided rocks, too, ye brighten;
Waysides ye gladden, wee, white *Immortelles*.

Flowers aromatic, buds fair as the morning,
Lovely and fragrant in death as in life,
Fitted to deck the young bride and adorning
Couches whose sleepers have done with earth-strife.
When you are gathered and frost has invaded
Moorland and woodland, our gardens as well,
Blighted their verdure—chrysanthemums faded:
Changeless and sweet are ye, *dead Immortelles*.

Ah, precious lesson! Some lives, thus undying
Live in our hearts, aye, in memory dwell
Deeds of the lowly ones, holy ones lying
Under the beautiful bright *Immortelles*.
Dear little, sweet little white Everlasting!
Fadeless, gold-hearted, beloved *Immortelles*;
Perfect in form, and in beauty outlasting
Blossoms of forest, mead, mountain, and dell.

EMMA MAY BUCKINGHAM.

THE PACIFIC NORTHWEST.

NOWHERE in all America can be found another locality equal to that portion of the Union lying north of California and west of the Rocky Mountains, known latterly as the Pacific Northwest, which embraces the State of Oregon and the Territories of Washington and Idaho, and occupies an area more than equal in acreage to the entire breadth of New England and the four original Middle States.

The tourist leaves San Francisco in a staunch, unwieldy propeller, of uncertain age and still more uncertain motions, and enduring for a while the benefits of a rollicking sea, by no means as "pacific" as its name would indicate, turns into his narrow berth, and with numerous compulsory tributes to Neptune, resigns himself to the spasmodic visits of a stolid stewardess, and bewails the spirit of adventure that beguiled him into the journey. After a day or two thus spent in abject misery, he finds himself growing too tired of his comfortless berth to longer remain in it, and being like Mrs. Dombey, constantly importuned to "make an effort," he rises, to find the seasickness gone and himself admonished by the cravings of appetite of the necessities of the inner man.

The ship keeps near the Oregon shore; so near that the fir-covered mountains seem to dance attendance upon the vessel's motion. But the scenery scarcely varies from the undulating monotony of eternal sameness, and the eye grows weary of its riot in the unchanging green upon the one hand and the illimitable void of the restless ocean upon the other. But after two, or at most three, days of steady progress, the steamer passes Tillamook Head, and nears Point Adams in the foreground, while away beyond the foaming waters of the Oregon River, and standing ever as a silent sentinel to guard the adventurous wanderer upon the seas, is the promontory of Disappointment, lately named Cape Hancock, though why, nobody can imagine.

The scenery is no longer monotonous. The dreaded Columbia Bar happens at the time of our crossing to be upon its best behavior, and we glide through the channel and up onto the peaceful bosom of the

mighty river, half provoked because of our former solicitude. Upon either hand are lofty mountains, covered with perennial green; and after awhile Astoria glides along the line of vision, like an imperceptible change in a panorama; and we soon halt the unwieldy vessel beside a slippery dock, where thousands of tons of salmon are awaiting shipment. A day's travel up the Columbia, followed by an hour's sail up the Willamette, and we reach Portland, the head of ocean-steamer navigation, and the front of the commerce of the Pacific Northwest.

I was not acquainted with a single individual in Portland and the time dragged heavily. To add to my discomfort, the autumnal equinox was in its prime, and a rainstorm raged fearfully. But the residents of Portland do not mind the rain. They are used to it; and they only jested when I complained that I could not go out. Finally, in sheer desperation, I gathered courage and went aboard a river steamer, my destination the Dalles of the Columbia, one hundred miles in the interior of the State.

Of the magnificent scenery in store for me, I had heard much; but was not prepared for the display of Nature's grandest freaks that everywhere greeted my wondering eyes, as the good steamer stemmed the rapid current and bore us onward into the very heart of the mountains. The outlines of many of the huge rocks seemed perfect, and retained their regularity on near approach; and what struck me as being rather remarkable was the cone-like shape of many of the huge boulders. I was up in the pilot-house all the morning, and the good-natured captain pointed out the places of interest and pleasantly answered my questions, which were not few.

It was night when we reached the town of Dalles, a wind-worn skeleton of a place, where a dilapidated hotel afforded what seemed precarious protection from the gale that fairly blew a hurricane. I passed the night in sleepless disquiet, and was sitting the next morning in the dingy parlor in a disconsolate mood, when a lady entered who brought with her a magnetic atmosphere that at once attracted me. She was above the medium size, well dressed and well proportioned, with light-brown hair, arranged in the latest fashion, but without any attempt at display. Her eyes were of that deep nut-brown color that you would almost contend was black, and were filled with a kindly radiance that at once interested me. She seemed well acquainted with every late arrival, except myself, and as she turned to me with a look of kindly inquiry, that had an eloquent, yet unspoken welcome in it, I longed to know more of her. A traveling acquaintance seemed to interpret my wish, and I was introduced to Mrs. Abigail Scott Duniway, of Portland, Oregon, editor of the *New Northwest*. An hour of enlivening chat followed; the lady in question seeming to know everything and everybody, yet with no attempt at display. Her atmosphere filled the house, and in a little while I forgot my depression and loneliness in the charm of her conversation.

After awhile she excused herself, as she had business to attend to, and I saw her no more till evening, when she came in pale and weary, saying she had not been strong this summer, nor able to perform near all of her accustomed duties; that she had failed for the first time in her life to fulfill all of her engagements, and the cares of her business pressed heavily.

In the morning I had wondered if she were ever tired. Now I saw that she was a woman after all.

"You will please excuse me," she said, rising to retire to her room, "for I am suffering with a headache."

With this she bowed herself out of the parlor, and a gentleman looked after her and said, "There's a woman who performs more mental and physical labor than any four men of my acquaintance. It's little wonder that she's breaking down."

"She is to lecture for us in the Congregational church to-morrow night," remarked another.

With a mental resolve to hear the discourse, which I was told would be upon "Law and Liberty," I took a train the next morning before the lady had made her appearance, my destination being Celilo, a railway and steamer station some sixteen

miles distant, where I spent the day among the wilds of nature and returned at night to find that the leader of the choir in the church had refused the key of the edifice to the trustees, and Mrs. Duniway was minus a place to lecture in. I was cruelly disappointed; but pretty soon the lady made her appearance, neatly attired in black silk, a smile of serene composure lighting up her expressive face.

"I am keenly disappointed," I said, earnestly.

"You need not be," was the cheerful reply. "I've spoken to the landlord, and he says I may lecture in the bar-room."

"And will you?" I asked.

"Why, certainly," was the decisive reply. "Why shouldn't I?"

"Are you often treated in this way?"

"Oh, no, not often, latterly. I am very seldom refused a church nowadays; though once in a while I find a feeble-minded bigot in authority, who feels compelled to protect his idea of the Deity from woman, and does it with a lock and key. But it's all right. This very opposition will set the people to thinking."

I confess that I did not share Mrs. Duniway's serenity. I feared that the citizens would not come to the bar-room—a large, ungainly apartment, with a stack of trunks against one wall and a row of shelves filled with whisky-bottles opposite. But they did come, and the room was packed.

Just as the clock struck eight Mrs. Duniway appeared, bearing in her hands the "Statutes of Oregon," a cumbrous tome in sheepskin, from which her points of "Law" were all taken, while her ideas of "Liberty" were collated from the Declaration of Independence.

It was a novel scene. Not far away sat the landlord, who was just recovering from a periodic "spree." Evidently he believed in Mrs. Duniway, and like all men I have met who knew her, respected her highly. After a little while, something she said excited his admiration, and he exclaimed, "Bravo," in a maudlin tone. This remark was followed by a general laugh. Mrs. Duniway left the counter, behind which she had been standing, and approaching him in a kind and fearless way, said something that the audience could not hear; but all knew by her manner that she had kindly begged him to be quiet. The effect was electrical, the audience being as much affected as the landlord.

Returning to her post as quietly as she had left it, Mrs. Duniway began to arraign the "Aristocracy of Sex," as she styles the Government of the United States, and her voice rang out in earnest, mellow tones the words, "He has refused his assent to laws the most wholesome and necessary for the public good!" Then for an instant she paused. Before her was the array of black bottles upon the shelves, and hard by the drunken victim of his own occupation.

"Men and brethren, have not the women of your Republic besought you, in the most humble terms, to pass a law for the removal from our midst of the fearful poison that men put in their mouths to steal away their brains?" she asked; "and have you not, as law-makers, refused to do so, although yourselves must know that the laws we ask for are the most wholesome and necessary for the public good?"

And while the landlord, whose hospitality we were enjoying, bowed his head in silence, an interest that could be felt was in the air.

For an hour and a half the speaker held her audience under the irresistible spell of an eloquence that is heaven-born. At intervals she would repeat some fragment of appropriate poesy that only increased the interest of her auditors. Then, by way of illustration, she would tell some touching story that would move many to tears. Occasionally the humorous prevailed, and the house would be fairly convulsed with laughter.

Alluding to the fact that the church had been closed against her, she said that she had once had a difficulty similar to that in a place where Fred. Douglas came along to lecture; and lo and behold! the City Hall, free entertainment at the best hotel, the brass band, and all desired facilities were placed at the disposal of the colored orator, who said, patronizingly, "Never mind, my dear madam, once they wouldn't provide me a hall or church to speak in, and I had

to lecture in the streets. They wouldn't let me stop at the hotel either, and I had to quarter myself on my colored friends. But I'm all right now; and after a while, when you become a voter, you'll be treated as well as a *nigger*."

I do not think this sketch would be complete without the poem with which she closed her discourse:

"THE SPIRITS OF SEVENTY-SIX."

I SAT me down in old Carpenter's Hall,
In the city of Brotherly Love,
In the quaint high-chair in which Washington
Presided, when Randolph and Jefferson,
And Adams and Lee, and a clergyman,
Bowed low in the shade of the twilight's fall,
And invoked the great Father above.

The city was full of the guests of the world;
For 'twas the Centennial year;
And the Orient bowed to the Occident,
And an Emperor greeted a President,
And a Congress met with a Parliament,
And banners of China and Ind' were unfurled
Beside ensigns of old Tangier.

As I mused in the depths of the gathering gloom
Of the twilight, chilly and gray,
Recalling the deeds of the days agone,
Before me, like specters, and one after one,
Came the "Spirits of Seventy-Six," who are known
To throng the shades of the silent room
Whenever the night holds sway.

The shadows around me grew gloomy and deep,
And the night in her draping of clouds
Filled the room with a chill that enveloped my head,
And a gloom, that o'ershadowed my soul, took part
With a thought that transcended the Muse's fine art;
And the Heavens began in their sorrow to weep,
And the generous paused and bowed in their shrouds.

"Good-evening," said I, as a masterly ghost,
With eyes of a heavenly blue,
Stopped short in his walk, and, with Chesterfield bow,
Said, "Madam, who are you, and what want you now?
Why disturb us, and why is that frown on your brow?
The chair you have taken is Liberty's post,
Give it me, and I'll bid you adieu."

"Indeed, sir," I said, "I'll not yield the chair
Till this spectral performance is o'er;
Till you tell me why men, though as ghosts, have more right
To this room than have I. Who are you? by what might
Do you claim sole use of this old Hall to-night?
Why assume such a proud, dictatorial air?
Have you all been here, good spirits, before?"

"I belong to the days of the Past," he then cried;
"Ere the Goddess of Freedom was born;
When Columbia in travail bit back the keen throes
That were frowned at and sneered at by Liberty's foes,
Who pity had none for her pains or her woes;
'Twas *I* called the demon of war to preside
O'er her destinies great, but forlorn!"

"And does Liberty live?" I replied, in surprise,
As I gazed on the phantom so bright.
"She does; but in bondage," he said, and a tear
Stole adown his pale cheek, as with listening ear
He gave quiet heed while I, quaking with fear,
Unfolded a tale that wide opened his eyes,
Till they flashed with a cavernous light.

"You have taught us that Freedom is Heaven's decree,
Yet your precepts you fail to enforce;
And I marvel not much that when night comes you walk
In a fitful unrest; that, like Banquo, you stalk
Through this gloomy old Hall, while to mortals you talk
Of poor Liberty's fate; for, till woman is free,
Confusion confounded grows worse.

"And now as I sit in your old chair of state,
At the end of a grand hundred years,
And look back on the work that e'en yet is undone,
I'm astonished, good sir, that you ghosts, every one,
Shrink not from my gaze, as from blaze of the sun,
For the mothers of men are in bondage as great
As caused all your bloodshed and tears."

George Washington sighed, and each listening ghost
Waved his hand in the cavernous air,
And the old Hall grew bright with a radiant light,
As Liberty, robed in a raiment of white,
Approached me and said, with a smile of delight,
"In the next hundred years I shall fill my own post!
Good-bye, George." I gave *her* the chair.

I do not wonder that the people who know Mrs. Duniway purchase her "David and Anna Matson." I find it on almost every center-table in the Pacific Northwest. Many bought it at the close of her lecture in the Dalles; and when her shattered health becomes fully restored, I have no doubt she will introduce it at her lectures all over the Union. It surprises me that she should have written an epic upon New England life, when one from life nearer Oregon could afford a more brilliant field for her wonderful powers of description.

Oakland, Cal.

CROOKED HABITS. — While shaking hands with an old man the other day we noticed that some of his fingers were quite bent inward, and he had not the power of straightening them. Alluding to this fact, he said: "In these crooked fingers there is a good text for a talk to children. For over fifty years I used to drive a stage, and these bent fingers show the effect of holding the reins for so many years." This is the text. Is it not a suggestive one? Does it not teach us how oft-repeated acts become a habit, which once acquired, remains generally through life?

PEACEMAKER GRANGE.

CHAPTER XX.

LARGE books might be written about Peacemaker Grange; but the much-mistaken public has as yet caught only a very faint glimpse of that beautiful hereafter, in which the existence of such institutions shall be the rule, rather than the exception.

We began with Judge Templeton and Farmer Hallett in the far West; we found them next upon the little steamer, sailing from Washington to the mysterious abode of the Peacemakers. We have surveyed — some of us with great delight — the grand unitary buildings. We have wandered through those buildings, observing their wonderful internal arrangements, whereby the greatest good of a great number of persons is obtained at the lowest possible cost.

We have wandered through the great plantations, with their vast variety of products. We have seen in the factories and workshops every one busy, every one contented, every one enjoying a frequent change of employment, and full exercise of all his or her discoverable aptitudes. We have seen the great store-houses filled with the winter supply of food for a thousand people. We sat in the restaurant enjoying all amenities of both private and public conviviality. From time to time we sat with the worshipers in the chapel, and saw that while these people are by no means bigoted, the highest morality and religion are their central thoughts. We found that while no one who desired it ever lacked an abundance of exquisitely congenial society, those who desired solitude could there obtain it more thoroughly than in any ordinary mode of living. We found everywhere order without despotism, freedom without licentiousness, comfort without sordidness, happiness without feverish pleasure.

It was apparent that in Peacemaker Grange, the fear of poverty, "through which we are all our lives subject to bondage," was quite unknown. This band of noble men and women had so long fought the battle of life side by side with success, that they felt that nothing could sunder, nothing could overthrow them, short of a general bloody revolution in the land.

We have studied the industrial and financial relations of the Peacemakers; have seen that by carrying out one of the grandest conceptions of Fourier, the very selfishnesses and cupidities of the people were made to balance each other. Continually changing their employments, leading in such branches as they were the best masters of, they cheerfully submitted to be led, when engaged in those branches of industry, the leadership of which had been shown by long experience to belong to others.

Right here the reader should be reminded that all the industries of civilization, including agriculture, are undergoing rapid changes. Whether such schemes as have been presented in this story shall be generally adopted, or not, the fate of all the old methods is sealed.

More and more what is called the division of labor must characterize manufacturing. In the making of boots, for instance, the most successful manufactories have ceased to allow one man to make the whole article. There are cutters, crimpers, heelers, etc., each sticking to his own specialty. Although it is evident that the working on such a narrow range, and using so few mental and physical faculties in a given time is ruinous to human creatures, it is evident that there is no escape from this ruin, as things now go. The shoe manufacturer knows, or thinks he knows, that he can get a greater aggregate of work from a man, by keeping him all his life at cutting or heeling, therefore his selfishness will induce him to compel his employés to follow these dull, monotonous routines.

Nothing but coöperation in all the relations of life can rescue the factory hands from this hard fate. When they own their own factories, they will say: "We will risk some loss in quantity, and even perhaps in quality, of our products, rather than deterio-

rate our manhood by leading an unnatural life. If we make boot-heels during a portion of the morning, we will go forth among the tillers of the soil the rest of the morning. If we push the plane a portion of the afternoon, we will run a factory loom to close up the day's work. So shall we be men, and not manikins."

And now what shall we say of those members of the Peacemaker Society and their guests, who have been the prominent personages in this narrative? We left them all "doing as well as could be expected," except the Rev. Edgar Anthony and our lady professor of Belles Lettres. Sorry as we are to part abruptly with this interesting couple, leaving them both quite undecided whether each should be, at some future time,

"A nearer still, and a dearer
Yet than all other—"

to the other. Space will not permit the following of the interminable ups and downs of their eventful intercourse. A whole volume should be devoted to its portrayal. *Money could not buy from us*, at present, the secret of "how it came out."

As to Farmer Hallett, he had succeeded, long before the period considered in the last chapter, in bringing his wife and family to the Grange. A curious crowd they were, until they became assimilated with the mass of average persons in the Association. The wife for a while found nothing suited to her, and bristled like the fretful porcupine; but possessing a mental substratum of common sense, she soon began to appreciate this "Gospel of Newness," and then everything suited her.

Among the five children there was a boy of ten, particularly rantankerous—the departed spirits of the great prairies seemed to have entered into him. On the day of his arrival, he was as much of a curiosity to the young people with whom he came in contact, as would be any strange fish of the New York Aquarium. Imagine the astonishment of a stout young Peacemaker, a little older and stronger than he, to whom, approaching in the attitude of the manly art of self-defense, he said: "Do yer want ter fight?" Receiving no response but a look of open-mouthed astonishment, he "let in with his terrible left" upon the right ear of the peaceable one.

The instinct of self-preservation instantly suggesting methods to the son of peace, the wild youth of the prairie suddenly found his hands pinioned behind him, while his indignant captor said quietly: "You little lunatic, we will have to teach you better manners than that." It did not take long for the resistless machinery of this great training-school to bring even this uncouth lad into a proper shape.

At the time in which we are leaving the persons whose career we have been following, no remarkable changes had occurred in their history since the events narrated as taking place in the fall of the panic year, 1873. Still did the pastor maintain his watch upon his high tower. Still could he often be found in the small hours of the night keeping vigil in the chapel, and wrestling like Jacob with the angel of the Lord for a blessing upon his people. Shrewdly did his practical wife manage to keep him still tethered to this nether earth. Sweetly the sweet singers sang in the chapel. Madonna-like, stood there the Judge's wife, in silent and in spoken prayer. Wisely, and still more wisely, did the Judge conduct the business affairs of the Society, greatly aided therein by the new convert from Wall Street. Ever more joyful and tuneful was the chorus of the fishermen over their well-filled nets. Everywhere was evident increment of harmony, and that wondrous orchestration which is as sure to result from a truly scientific reorganization of society, as were the stars and planets to fall into normal courses, when sent forth by that vast, unerring Intelligence that manifestly did send them forth.

Blithely the field-groups went afield, and the all-pervading spirit of harmony led them also to chant sweet carols. And in the workshops, where noiseless labor was in progress, the impromptu song would oft break forth. At other times one would read aloud, while the others worked. At times when some arduous task (say of ditching) was on hand, which necessitated soiled clothes and masculine muscle, and which those engaged in it preferred to continue

at until it was finished, a company of their wives would go out to them in large carry-alls, bearing with them a well-cooked dinner, stored in a newly-invented apparatus, which delivered it to the hungry men just as it came from the great kitchen.

While all over the land usury and exorbitant rent and profits—the great curses of our race—were eating up the people; while British free trade and bullion currency—twin ogres—were scoffingly offered as a remedy for our troubles, the men and women of this Society knew no fear—felt themselves under "the shadow of a great rock in a weary land." At one time for six months they experimented in depending entirely, except as to a few tools, upon the products of their own domain. After that they felt doubly safe.

This chapter concludes all that is to be said at present in this magazine about Peacemaker Grange. It is certainly encouraging to the advocates of social reorganization that for two long years the readers of the PHRENOLOGICAL have even listened, from time to time, without apparent murmur, to this exposition of ideas, many of which it has been the fashion for the last quarter of a century to consider quite abominable. It is evident that even the most conservative readers have been induced to at least reserve judgment, because of the apparent sincerity of the writer and his disposition toward fair and square dealing with all the subjects handled. For twenty years previous to the gloomy epoch in which we now find ourselves, he, with a few other Americans, had been refusing to join in the general acclamations, scarcely interrupted by the war, over the supposed fact that in this land we had arrived, at least, at the Year One of universal human felicity. He saw that we had made, in reality, no new departure, and that only our vast extent of unused soil, open to all settlers, was postponing in the United States all the misery of Europe. Continually full of sad foreboding all through these years, concerning the future of this "beautiful land," and this vigorous young nation; and desiring to do something in the way of helping to remove the evils that oppress the country, and some constructive work in the way of suggesting or furthering such changes in our social and political systems as would tend to the permanent well-being of the nation, he has adopted a method of attaining these ends somewhat different from that which is now fashionable among progressive people.

While entertaining a thorough respect for all the sincere and earnest modern scientists, and endeavoring, as occasion offered, to gain an understanding of the more valuable fruits of their efforts, he has felt that their somewhat arrogant claims should not be wholly yielded to. As to his own culture, he has felt with one of old that wisdom was the principal thing, and that it was a very different thing from mere learning. He felt that if he would attain to a genuine helpfulness, it must be through such a balance of faculties and acquirements as would enable him to rightly distinguish between things that differ. Therefore his prayer to heaven has been, "Above all things give me wisdom; show me how to acquire it." While thirsting for all knowledge, and earnestly desiring a thorough acquaintance with the works of the great scientists, metaphysicians, historians, philosophers, etc., he has always guardedly approached such studies, and has daily inquired of himself before engaging in them: "Is there nothing that I can do for my moral and spiritual culture and elevation, that will tend more to enhance my usefulness, than the acquirement of this much-coveted learning?" As a consequence, he can not boast of any extraordinary attainments in science or general learning. He has aimed, and he trusts not in vain, at that good old-fashioned wise-heartedness, so often referred to in the Mosaic writings, which may be considered a result of a thoroughly even, normal, and parallel cultivation of the head and the heart—that is, the intellect and the moral sentiments. That the course he has pursued in this regard has led him to conclusions quite other than those generally received among the most prominent moral and religious teachers, and social and political economists, has been a cause of much grief, and much bitter practical discomfort to him. He can only remember that most very useful persons have been born at least

"A hundred years too soon
For the comfort of their days."

SAMUEL LEAVITT.

It is only by training all together—the physical, intellectual, and spiritual elements—that the complete man can be formed.

TEA AND WEAK BACKS.

IN the November PHRENOLOGICAL the reader saw, doubtless, a short paragraph in which one of the doctors recommended the administration of tea in cases requiring severe surgical treatment, on account of its peculiar influence as a nervine. In the extreme depression incident to an injury which demands the removal of a limb by amputation, tea may serve a useful purpose, and thus prove a true medicine, while drinking it when one is in health may be abnormal and harmful. In support of this view we cite the opinion and experience of another doctor, J. Adams, of Toronto, which have been recently given to the public through the pages of a little book on electricity and the use of coffee, tea, tobacco, and alcohol. Weak backs are so common, especially among women, that any new suggestions are appreciated. Dr. Adams proceeds to say:

"Some seventeen or eighteen years ago my attention was providentially directed to the action of tea upon the urinary and sexual systems, and each succeeding year's experience has strengthened my convictions of its baneful influence upon the human race, by engendering and maintaining an unnatural excitement of the sexual organs, and I do not hesitate in affirming that to the constant use of tea may justly be attributed much of the fearful sensuality that prevails around us. This is very easily understood when we reflect that tea exerts, first, an exciting and subsequently a debilitating influence upon the nervous system in general, and the lumbar portion of the spinal marrow, commonly called 'the loins,' in particular. Why this is I do not pretend to explain; all I know is that such is the case, and if those in the habit of using tea and suffering from the consequent *weakness and pain in the small of the back*, will only abstain from its use for three or four weeks, the relief they will experience will satisfy them of the truth of my assertion.

"A year ago a young, square-built girl came to me for advice and medicine for the backache. 'Oh, doctor,' said she, 'I shall have to give up my place and go back home, for I can't stand the work; it makes my back ache so badly.' 'Give up your tea,' said I, 'and you will soon lose your backache.' She agreed to follow my advice for a month, and after giving her a little medicine for her general health I dismissed her, never expecting to see her again, as my advice in such cases is rarely followed for more than a week. But, to my astonishment, she returned in a month, bright and smiling, and hardly had time to get into my office before she exclaimed: 'Oh, doctor, I'm never going to drink tea again. Would you believe it, I hadn't taken your medicine and given up the tea for a week before the pain was out of my back, and now I feel stronger than ever.' As I have not seen her since, I am in hopes that she has profited by the lesson, which is more than I can say of many another patient who, after being relieved of her backache, has returned to her tea—and consequent suffering.

"While, then, the primary action of tea is to exhilarate and excite, its secondary effects are to enfeeble the nervous system and produce depression of spirits, languor, excitability, irritability, disinclination to active employment, weakness and pain in the back. These symptoms may be temporarily relieved by a fresh supply of tea, just as the trembling hand of the drunkard is steadied

by a fresh glass of liquor, but only to be followed by increased nervous prostration; and this continued round of stimulation and relaxation naturally wears out the human frame long before the allotted time.

"The loss of a few years of life would be a matter of less importance, were it not that premature decay of the nervous power is invariably accompanied by distressing ailments, such as nervousness, sick headache, dyspepsia, neuralgia, sleeplessness and its too frequent result, insanity."

MY LIVER.

WHAT makes this world so drear and sad?
Why am I never, never glad?
What is it drives me nearly mad?
My liver!

Why do I moan, and sob, and sigh,
And wish, ay! wish that I might die?
Why would I pass from earth, oh, why?
My liver!

What is it on my heart doth seize;
Then come in form of cough and wheeze;
Then makes me think I've Bright's disease?
My liver!

Whence is this spinning in my head?
Why are my pulses almost dead?
Why doth my stomach feel like lead?
My liver!

What makes me sausages eschew,
And buckwheat cakes and mince-pie, too,
And ev'rything that's iced? Boo-hoo!
My liver!

What is it, day and night intent
On ev'ry sort of devilment,
Doth all the ills to me present?
My liver!

GROUNDWORK OF HEALTH.

No. IX.

ALTHOUGH it may be said that we should be ready to do the so-called menial offices one for the other, yet the time is undoubtedly approaching when those offices will not be fulfilled for "pay." Sound health of mind and body, as an universal rule, is unattainable only by the perfectly equitable distribution of labor and its rewards, not as now understood, but absolute. All is tending in that direction. Of course the so-called conservatives put as far away the time of this emancipation as possible. Probably a medium between the two extremes is best, as avoiding iconoclasm.

No one questions the desirability of health; yet extremely few are ready to obey its laws. Self-knowledge and self-control are so seldom found in one individual that the true exponents of hygiene are rare. In this age of peculation and dependence the ability to clearly define health is almost impossible. As John Stuart Mill says: "The faculty of arousing the necessary opposition to evil without at the same time exciting the enmity and opposition of those we would like to benefit, is rare." Even after one is convinced that a better way is found, it is hard to persuade the following.

Humanity is mapped out and farmed out so completely, that the moment the finger is outstretched to point a better road, a clamor is raised by the throng that profits by evil. And those that do not, either directly or indirectly, profit thereby, are in such a hopeless minority that the only way out of the labyrinth is by education, and an entirely new system of education at that. The system might be called Hygienic and Industrial; but as no health is possible without some industry, it would seem sufficient to call the new school Industrial.

Following known data to logical and truthful deductions, no one has a right to ask of another menial office or so-called duty. The moment such is asked or accepted, that moment the borderland of slavery is entered upon. What matter if I be a pampered child of slavery. Must I stultify the nobility of my own nature in obedience to dictates of self-inthrallment? Who would see the world emancipated, must first emancipate themselves.

The first step toward this is the virtual doing of all the work—call it drudgery, or what you will—necessary to a subsistence. Mind you, this is not placing an entire bar upon the division of labor. Such division is salutary, if not carried to extremes. *But the laws of health demand a certain restraint to be placed upon the division of labor, else the stronger soon compel the weaker to do all the real work.* F. M. S.

ANCIENT COOKERY.

Primeval Cookery—Gross Violations of Nature—Yeast—Expensive Eating—Effects upon the Taste—Seasonings—Romish Cakes—Garum—Artificiality.

VERY often is a history locked up in a word. It is certain that the words in which our ancestors expressed their thoughts come down to us and help to influence our thoughts. The structure of our language has been greatly influenced by the ancient languages, and the Greek and Roman classics are considered so important that they are made text-books in our schools. Is it not possible that our cookery may also have the same stamp, and that as unconsciously as we press into service the classic thought and classic word, we may also follow the classic taste in classic recipe? As our words have come down to us in mother tongue from generation to generation, as the son speaks like his sire, so the daughter cooks like her mother, using styles and condiments, dishes and recipes, that her mother used before her.

Where did they originate? So far as our observation goes, women are not much given to devising new dishes. It is true that changes come, perhaps through accident, perhaps through stress of circumstances, but often with as little thought as might be given to the gradual change of a word. But if classical literature has had an important influence on our modes of thought, is it not much more probable that classical cookery may have had quite as important an influence on our modes of living, and through them upon our health?

We have reason to believe that

PRIMEVAL COOKERY

was exceedingly simple. Our first glimpse of it is in the patriarchal tent of Abraham, where Sarah kneaded "fine meal" and made cakes upon the hearth, which were served with the dressed calf and butter and milk. For aught we can see in the text, the patriarch himself cooked the calf, and if he did so, he was justified by noble company. His own grandson is represented as making a pottage so seductive as to beguile his brother of the birthright. The heroes of Homer did their own cooking. Achilles turned the spit. Their exact methods of cooking are not very carefully recorded, and it is probable that the women did the most of the culinary work, yet the mention of many such circumstances seems to indicate that it was done with very little art and upon occasion by those who needed it. Roasting meat before the fire or seething it in a pot, and baking cakes in the hot ashes on the hearth were probably for ages the highest achievements in that line—wholesome cookery indeed! Shall we say that it were better if we had never departed therefrom? Is it true that man in this respect, in his best estate, is a barbarian, or shall we take the results of a long experience in waywardness and learn how to come back to nature intelligently and permanently?

The first

GROSS VIOLATION OF NATURE

we find in the leaven which apparently the Hebrews learned to use among the Egyptians. This was simply sour dough, usually kept by reserving a piece of the bread-dough until the next baking. This addition excited fermentation in the mass more readily than if left to sour of its own accord. With the increasing fineness of their flour had come the need of something to make it light, and as they had not our ovens or gem-pans or our other intelligent devices for making bread at once light and wholesome, they accepted this chance device of leaven and used it for centuries; indeed, it is still in use. There is little doubt that its impure character was partially recognized among the Hebrews, for in some of their ceremonial purifyings all leaven and all fermented articles were removed from the house.

The first traces we find of

YEAST

are in the writings of Pliny. He says that for leaven the Romans mixed millet with sweet wine and let it ferment a year! They also employed wheat bran soaked for three days in sweet white wine and dried in the sun. Of this they diluted a certain quantity at the time of making bread, which was left to ferment in the best wheat flour and af-

terward mixed with the entire mass. This is our present style of "sponging," plainly enough, though the "yeast" is not so definite. Indeed, these and the following items show that the Romans at that time did not use yeast in its present form: "A dish containing two pounds of barley paste was heated until ebullition commenced. It was then put into vessels until it became sour. Very often leaven was procured from dough just made. A piece was taken from the mass and left to turn sour for subsequent use." In addition to all this, Pliny goes on to say that the Gauls and the Spaniards, after having made a drink from grain, *saved the scum* to raise dough, and that their bread was the lightest of all. Perhaps some of our readers will recognize this as having the same origin as our "brewer's yeast;" to others, who never before looked so far, it will unfold the not over-clear origin of the first cup of yeast—the filthy scum of the decaying liquid in the brewer's vat. Verily, they did find something at last wherewith to make their bread light, but it was at a rather severe cost to its cleanliness and nutrition.

In the gratification of the palate and the fancy, the Greeks and Romans at last launched upon a mad whirl of artificiality, which delighted in outraging all laws of nature, moderation, common sense, and even decency. One hardly knows where to begin the strange list, unless indeed we begin with the degeneracy of aims, the grossness of greediness, and the recklessness of expense which permitted such extravagances.

EXPENSIVE EATING

came to be apparently the only ambition of the Roman people and their rulers. Their senators vied with each other in giving the most extravagant dinners, and their emperors took the lead to such a degree that some of them are noted only for the extent of their appetites. The Emperor Claudius sat down to table at all hours and in any place; nor did he leave the repast until distended with food and soaked with drink, and then only to sleep. When he awoke, a tickling feather relieved him of his surfeit, and he was ready to eat again.

Many of the gourmands became great adepts in the use of the feather. Vitellius used it so effectively that he could cause himself to be invited to dinner by several different senators the same day. Little he cared if it should cause their ruin; for they could not venture on such a banquet at a less expense than 400,000 sesterces ($16,000), and this was but a moderate sum. Lucullus served Cicero and Pompey with a little collation that cost $5,000, and there were three of them to eat it. How they could expend so much may be easily seen if we examine their dishes, which were little prized unless procured at great expense. The hard flesh of peacocks, at forty dollars per pair, was preferred to that of cheaper but more delicious poultry. But since many could avail themselves of peacocks, even at this price, those who would not be outdone had dishes of peacocks' brains. Another dish was composed of the tongues of singing birds. Young pigs were fed on dates; geese were fattened on figs, and their livers alone were used, being soaked in milk and honey—the forerunner of the modern *paté de foie gras*. Fish were in great demand, and those which were brought the greatest distance were the most highly esteemed. Whole fleets of ships were employed in bringing these and other dainties from abroad. Roman nobles would not unfrequently pay one hundred dollars for a single lamprey. Mullets sold as high as from seventy-five to one hundred dollars each, and it is related that Crispinus paid three hundred dollars for one weighing six pounds, and considered it cheap at that. In the reign of Tiberius three of these were sold for over one thousand dollars. What, then, must be the cost of dishes composed only of the livers of these fish? Heliogabalus had upon occasion two large dishes filled with their gills only. At last the wealthy built expensive reservoirs and kept their own fish, though not with a view to economy, for they fed them with the rarest dainties. It was even said that slaves were sometimes thrown in to satiate these pets, but whether this be true or not, their sea-eels were commonly fed with veal soaked in blood. Other sorts were taken from the

river just where it received the filth from the entire city.

In wonder it may well be asked what had become of the common sense and decency of human nature. We can account for these excesses and atrocities only by observing the entire departure of the people from natural rules and their utter abandonment to the artificial. Instead of studying into the nature of their materials, with a view to producing the greatest harmony in their combinations, they seemed to consider it a crowning achievement if they could entirely obliterate all traces of their real nature and substitute therefor whatever was most foreign and not recognizable. Fish of various sorts were served up to resemble pork, veal, beef, or mutton, and *vice versa*. Vegetables were cooked to resemble meats, and meats disguised to resemble other substances. Eggs were served, which on being broken were found to contain fat ortolans. The cook of Louis XIV. who on Good Friday served up a dinner apparently composed of poultry and butcher's meat, but which was really nothing but vegetables, had a good deal of the same spirit, and must have had no small amount of practice to bring about such results.

But what of the

EFFECT UPON THE TASTE?

It is related of one of these old gourmands that he was seized with an invincible desire for loaches. It was in the middle of the night and they were far from the sea. He had no idea where the loaches could be obtained, but loaches he must have, and his chief cook was summoned. "Loaches, sire!" cried the man in dismay; but the command was imperious and must be obeyed. This cook was more skillful than the noted Vatel, cook to the Prince of Caudé, who when he found that his master was to entertain the king at dinner, and there were no fish to be had, went to his room and threw himself upon his sword. The demand for loaches sent this man to his room, not to kill himself, but to study and experiment. Before long he came forth with a plate of fried loaches, irreproachable in appearance, and as to taste the gourmand declared he had never before eaten any he liked so well! And of what were they made? Of radishes pared, cooked, and seasoned. But if we admire the skill that could prepare such a dish, what must we think of the taste that judged it?

Of this taste we may judge partly by their

SEASONINGS.

The following ingredients composed their sauce for crawfish: honey, vinegar, wine, garum, oil, chopped onions, pepper, alisander, carrots, cummin, dates, and mustard. The following is stuffing for a crab: cummin, mint, rue, alisander, pine nuts, and pepper, soaked for a long time in garum, honey, vinegar, and wine. The following made sauce for roebuck: pepper, parsley seed, dry onion, green rue, spikenard, honey, vinegar, garum, dates, wine, and oil. The following is the entire recipe for a dish of ducks' brains: "Cook some ducks' brains and mince them very small; then place them in a saucepan with pepper, cummin, benzoin-root, garum, sweet wine, and oil; add milk and eggs, and submit the whole to the action of a slow fire." The celebrated Apicius gives this dressing for roast duck: "Make a mixture of pepper, cummin, alisander, mint, stoned raisins or Damascus plums; add a little honey and myrtle wine; place it in a saucepan, cook, and then add to these substances vinegar, garum, and oil; afterward, some parsley and savory."

ROMISH CAKES.

We find a large share of the recipes equally absurd; we select a few cakes from Apicius: "Mix pine nuts, pepper, honey, rue, and cooked wine; cover with eggs well beaten; submit this mixture to a slow fire, and serve after having smeared it with honey." Again: "Make a compact mixture of honey, milk, and eggs; let it cook very slowly, and serve after having sprinkled it over with pepper." Less elaborate cakes were made with cheese and rye or other kinds of flour, and sometimes with the addition of eggs and honey. Sugar they did not have, hence dates, figs, and honey were their principal sweeteners, but cheese was a common ingredient of their cakes. Here is one of the most simple: "Half a pound of flour, two and a half of cheese, three

ounces of honey, and one egg. As soon as baked it was smeared with honey and dredged with poppy seed." It was eaten with spoons. We should hardly accept it now, either for taste or wholesomeness, though it is not quite so gross a conglomeration as the sauces already given.

It will be noticed that every one of these included

GARUM.

This was the "universal" sauce of Roman meat cookery. Like the East Indian curry, it went into everything. We have no such universal seasoner, unless it be salt. Catsup and Worcestershire sauce, as used by some individuals, afford some illustration, only that these find their place in the caster, while the garum was usually added by the cook. In a collection of old Roman recipes now before me, of fifteen for preparing chicken, lamb, and kid, twelve contain garum. Its character betrays at once the coarseness of the Roman taste and the uncleanness and artificiality of Roman food preparations. Its essential ingredients were salt and decayed fish. They "macerated the intestines of fish in water saturated with salt until putrefaction began to show itself, and then they added parsley and vinegar." "A thick garum was also frequently obtained by allowing the entrails and other parts generally thrown away to liquefy in salt." "In the time of Pliny mackerel was preferred, of which they employed either the gills or the intestines."

So if any one wishes to get a tolerable idea of the character of this famous Roman sauce, let him visit an ancient and deserted barrel of salt mackerel, in which some of the fish have been left to spoil, and secure some of the delectable brine. He will probably find it sufficiently revolting to his unaccustomed taste, without attempting to manufacture it *en regle* from the gills and intestines. That the above are not exceptionally repulsive methods of preparation, will appear from further recipes. The following was in very common use: "Amatuus took very small fishes or only their entrails and threw them into a vessel with a large quantity of salt. These were exposed to the sun and long and frequently stirred. When heat had caused fermentation and the vessel contained only a kind of pulp or paste, almost liquid, a kind of willow basket was introduced, into which the garum alone could penetrate." "Although fish was generally used, the flesh of several animals was sometimes employed in the formation of garum."

Of course, this was too inexpensive to suit the taste for lavish display, and the "apogee of refinement" was secured by using the liver of the red mullet, the expensive fish we quoted above. Others again used the blood of mackerel or of the mullet, and a quart of this garum, on account of its scarcity and the care necessary for its production, cost from fifteen to twenty dollars. Oeno-garum was a preparation of garum with wine and spices, and eleo-garum was garum with oil and spices; hydro-garum, with water, etc.

"The principal elements of garum, then, were almost invariably the same—fish, salt, and a greater or less fermentation. No doubt this was detestable, but then no one ever thought of regaling himself with this liquid. It was never taken alone, but was reserved as a seasoning for a host of dishes in order to heighten their flavor." Apicius, that greatest of authorities among Roman cooks, "places it in almost every sauce, but never serves it by itself, nor does he use it unmixed." It was so strong and foul that it could not be eaten by itself, but to offset that they befouled all other dishes with it.

Garum itself has dropped out of our legacies from this ancient cookery, and from those impure times; but not so all the principles that lay at the foundation of its use. We find them still in the fermentation, the indigestibility, and the artificiality of many of our food preparations. By fermentation we have prepared a great many poisonous drinks; we have destroyed much nutrition in bread and bread preparations; spoiled many good fruits and vegetables by making them indigestible, as pickles and sweet pickles, and brandied fruits; but above all, we have inherited so artificial a style of cooking that our cooks study the rules, the recipes, and the cook-books, and never the nature

of their materials, only so far as to ascertain their plasticity with regard to shape. This tendency to

ARTIFICIALITY

is one of the greatest misfortunes now in our cookery. It so dominates us that we have very little thought of originality. Women who can invent fashions, trim up or make their own bonnets out of old materials, and make over dresses to look as good as new, scarcely ever get up a new dish for their tables. If they do chance to vary an old style, under the force of circumstances, and get a good result, they seldom follow it up and perfect it until they make a new and permanent dish. And this is largely because they do not understand the principles of cookery or the harmonies of combination. These harmonies are not recognized. They have scarcely seen the light since they were pared into the grotesque shapes that disgraced the Roman tables and drenched into uniformity of taste with garum and kindred devices.

A lady who has had long experience of "skilled" English cooks, remarked to me that their dishes were usually attractive in appearance, but disappointing to the taste. The French women are more apt in their study of materials, and more enterprising in their combinations; but we have only to look into books like that of Blot to see "two bay-leaves and a sprig of thyme," repeated with a frequency that inevitably brings to mind the garum of Apicius. If any thoughtful mind could fail to see the probability of perpetuating error in the unquestioning uniformity with which the daughter follows the mother in her cookery, we might trace the descent of still other preparations that have come down to us like the fattened geese livers, the yeast, and other products of fermentation; but we hope enough has been said to awake a questioning spirit which shall refuse to take any recipe or custom merely because it has the sanction of age. Any abomination sanctioned by age is doubly an abomination, and requires greater energy of effort to contest its demands. We do not wish our Government or people to copy the excesses of the Roman people, and certainly in their later days their excesses had everything to do with their artificial and luxurious cookery. The bare possibility that in our traditional recipes we may be drinking from a fountain so defiled as the Roman cookery, should lead us to seek for fresher springs and for natural fountains. And if we can learn from all this waywardness some reasons for naturalness and its advantages, it will not be in vain that we have studied for a little while the artificiality of a dominant phase of ancient cookery.

JULIA COLMAN.

THE BATH AND GROWTH

IT has been urged often enough through these columns that a frequent washing of the entire body is conducive to health and vigor. The instances of invalids who have been cured or greatly invigorated by a daily hand-bath are so numerous that one who will take the trouble to investigate the subject must be convinced of the efficacy of ablutions.

At the Domestic Economy Congress, recently held at Birmingham, Mr. Edwin Chadwick, C.B., said the effect of cleanliness was not sufficiently recognized. He found evidences of its effects in various ways. Dealing with the animal creation, he said the pig that was washed would put on one-fifth more flesh with the same amount of food than the pig that was unwashed. The same effect was observable in other animals. They had seen the horse washed from head to foot to give it additional force. The same argument applied to the human creature. He knew the case of an army hemmed in by the enemy and put upon half rations. They were regularly washed, and it was found after a time that the men who washed were equal in force to those who were unwashed and put upon full rations. Head to foot washing was not only important in the matter of economy in food, but also for the prevention of contagious disease. Nurses who attended scarlatina cases and other cases of contagious disease had found out that, by washing

twice a day, and sometimes by changing their clothes, they might withstand the dangers resulting from the practice, and doctors who were similarly engaged had come to the same conclusion. As a defense against an outbreak of epidemic disease he would have the whole population tubbed. He mentioned that in a prison containing 1,200 persons, washing was enforced, and instead of using 70 to 80 gallons of water for each bath, and causing a large expenditure of time, a very simple method was devised for giving the prisoners a thorough good bath. Each man was placed in a recess, with a spray of tepid water overhead, which completely cleansed him. Schools at which unwashed children attended were centers of children's epidemics.

We knew a young man, broken down and wasted to a mere skeleton by rheumatic disease, who took the place of an assistant in a Turkish bath establishment, where for five or six hours every day he was applying water in one way or another. In this occupation he gained weight and strength, and made good progress toward recovery.

CONSUMPTION AND FOUL AIR.—The air we breathe, which a great English physician calls gaseous food, may become impure to the degree of being *indigestible* to our lungs and utterly unfit for the performance of functions which are quite as important as those of our solid and fluid victuals. Dull headaches, nausea, loss of appetite and of the sense of smell, and the sadness produced by the unsatisfied hunger after oxygen, are only incidental and secondary evils; the great principal curse of the troglodyte-habit is its influence on the respiratory organs. In 1853, when Hanover and other parts of Northern Germany were visited by a very malignant kind of small-pox, the great anatomist Langenbeck tried to discover "the peculiarity of organic structure which disposes one man to catch the disease while his neighbor escapes. . . . . I have cut up more human bodies than the Old Man of the Mountain with all his accomplices," he writes from Göttingen in his semi-annual report, "and, speaking only of my primary object, I must confess that I am no wiser than before. But, though the mystery of small-pox has eluded my search, my labors have not been in vain; they have revealed to me something else—the origin of consumption. I am sure now of what I suspected long ago, viz., that pulmonary diseases have very little to do with intemperance or with erotic excesses, and much less with cold weather, but are nearly exclusively (if we except tuberculous tendencies inherited from *both* parents, I say *quite* exclusively) produced by the breathing of foul air. The lungs of all persons, minors included, who had worked for some years in close workshops and dusty factories, showed the germs of the fatal disease, while confirmed inebriates, who had passed their days in open air, had preserved their respiratory organs intact, whatever inroads their excesses had made on the rest of their system. If I should go into practice and undertake the cure of a consumptive, I should begin by driving him out into the *Deister* (a densely-wooded mountain-range of Hanover), and prevent him from entering a house for a year or two."—*Popular Science Monthly.*

TOBACCO AND CANCEROUS TUMORS.—An Albany surgeon recently removed a cancer from a smoker's mouth to save his life. The operation is one of great difficulty, and the danger of death from hemorrhage is very great. The lower lip was divided to a point below the chin, the flaps turned back sufficiently to expose the lower jaw, which was then sawed through at the chin; and after the tongue had been amputated, holes were drilled through the jaw-bone and it was wired together and the divided lip replaced. The influence of the tobacco poison is direct and dangerous in developing this fearful disease; and did the public know the number of operations performed in private hospital practice for the relief of men who have suffered from it, there would be less tobacco smoking and chewing.

RECORD OF SCIENTIFIC DISCOVERY.

A New Method for Preserving Iron.—A method has been introduced by Prof. Barff, of London, which will probably indicate a high value to those engaged in the manufacture of iron implements for household and agricultural purposes. He covers the surface with a layer of the magnetic oxide of iron by exposing the metal to the action of intensely superheated steam. The black film of magnetic oxide adheres with more firmness even than the particles of the metal adhere to each other and will resist a file. Iron thus protected has been exposed for a long time to the action of moisture and corrosive acids without change, and it is practically unoxidizable by any agent. The process is cheap and can be conducted to any desired extent.

By this invention, the use of iron for many applications must be greatly increased. It does away with the enamelled iron culinary utensils, so liable to be poisonous, and also "tin-ware," so called. Iron plates protected by the magnetic oxide will be used for a large number of purposes where the more costly copper is now used. Perhaps more important than all, the discovery will break up the use of "galvanized iron" water-pipes, by which so many individuals and families have been poisoned. It gives us a cheap, safe, water conduit pipe, which has long been needed and sought for. If no practical difficulties arise in the manufacture—and none are anticipated—it can not be long before the great benefits of this discovery will be realized by every community in the civilized world.

The Jersey City and New York Tunnel.—The entrance on the New York side will be in the neighborhood of Washington square. From Jersey City the grade will descend two feet in every 100 feet, until a point 2,700 feet from the New York side is reached, when it will begin to ascend at the rate of one foot in every 100 feet. The tunnel will be two miles in length, with a road-bed twenty-three feet wide, and two separate tracks. Through its entire length it will be lighted with gas. The wall will be constructed of brick, with a thickness of four feet. At no point will the top of the tunnel be less than thirty-five feet below the surface of the water, and in many places it will be seventy feet below. 120 laborers will be engaged in the construction of the tunnel. The work will go on during the whole of the twenty-four hours, the force working in three relays of eight hours each. Although the tunnel will be used for the conveyance of passengers, its main object will be the transportation of freight to and from the great railroad lines which terminate in Jersey City.

Concussion as a Check in Disease Germs.—In the late Convention of American Scientists, Mrs. H. K. Ingram, of Edgefield, Tenn., read a paper on "Atmospheric Concussion as a Means of Disinfection." It was philosophical in tone, and of more than average merit and suggestiveness. It began by reference to the germ theory of diseases, and the evidence that many of the most dreaded pestilences were transmitted by living organisms. The probability that these germs float in the air and are thus communicated, being breathed into the lungs, was shown by various citations of authorities upon the spread of cholera. It was mentioned that the workers in copper, brass, and bronze in Paris and other cities, almost entirely escaped the attacks of the disease. Dr Burg has argued that the metallic emanations from that employment destroy the cholera germs. Mrs. Ingram's proposal is to kill the germs by a concussion of the air. She states that, for instance, all the mosquitoes in a room can be killed by exploding in the center of the room, a small quantity of gunpowder on a shovel. Fish can be similarly killed in the water. The worst outbreaks of cholera occur in the stillest hours of the night; possibly the concussions of the air during the busier hours may prevent the germs from spreading, in fact may kill them. Some experiments which Mrs. Ingram has made lead her to believe that gunpowder explosions might be used to kill the vine-pest, the phylloxera, as well as the microscopic insects or germs that propagate zymotic diseases.

A Horological Curiosity.—The Swiss certainly lead the world in the fabrication of curious and complicated clocks and watches. The Geneva *Continent* describes a clock recently made by Messrs. Golay-Leresche & Sons, and now on exhibition in Geneva, which, besides the usual dials, has others for the days of the month and of the week, with barometer and thermometer indicators. "The case is surmounted with a beautifully carved group in frosted silver. Nor is it a silent group. When a spring is touched there emerges from the hollow trunk of a tree a little bird of exquisite plumage that whistles the first bars of a lively measure. A shepherd, seated on a rock, continues the tune with his pipe; the little bird answers, and the concert continues until each has whistled and piped three times. Whilst this is going on, a cat comes from a corner and creeps softly toward the bird and bounds on his prey. At this moment both disappear and the music stops. The attitudes of all are thoroughly natural. The fingers of the shepherd move to the tune; when playing to the bird, his head turns in that direction, the latter flutters its wings and opens its mouth in the most correct way imaginable, and the way puss darts on her prey is true to life."

A City Under a Lake.—An engineering problem, as interesting as the laying open of Pompeii, is involved in a strange discovery which is reported from the Lake

of Geneva. A tourist having lost his trunk, two divers were employed to search for it. While they were below water they found what they supposed to be a village, since covered by the lake. Their statements led to the investigation of the spot by the municipal authorities, who took measures to ascertain the truth of the extraordinary account of the divers. On covering the placid surface with oil, these latter were able to distinguish the plan of a town, streets, squares, and detached houses marking the bed of the lake. The ruddy hue which characterized them led the observers to suppose that the buildings had been covered with the famous vermillion cement which was used by the Celts, Cimbri, and the early Gauls. There are about 200 houses arranged over an oblong surface, near the middle of which is a space more open, supposed to have been used for public assemblages. At the eastern extremity lies a large square tower, which was taken for a rock. A superficial investigation seems to indicate that the construction of these buildings dates from some centuries before our era. The Council of Vaud has decided to have the site of the dwellings inclosed by a jetty stretching from the land, and to drain off the water, so as to bring to light what promises to be one of the most interesting archæological discoveries of the present time.

Use of the Telephone.—During a recent visit to Cleveland, says the *American Manufacturer*, we found the telephone in use in a number of offices, and conversation being carried on between them and their manufactories at distances varying from one to seven miles, this, too, in an ordinary voice, with no particular effort except for distinct pronunciation. The Cleveland Paper Company has fairly domesticated this new discovery in their offices in connection with their different mills It is also in use by the Standard Oil Company, Union Iron Works, Cleveland Transfer Company, Cleveland Iron Company, Leader Printing Company, Rhodes & Co., and other firms, while orders are being filled as fast as it is found convenient to do the work.

Test for Flour Adulterations.—From the London *Corn Trade Journal* we learn that Dr. Himly, professor of chemistry at the University of Kiel, has suggested a method by means of which any person of ordinary intelligence may test the amount of adulteration of flour. It is based upon the fact that chloroform is specifically lighter than nearly all the substances usually employed for these adulterations, such as lime, chalk barytes, plaster, marble, bone-powder, etc., while the genuine flour is again lighter than chloroform, in which none of the above-named substances are soluble. The testing process is simple, and all the apparatus required is a small test tube about three-eighths of an inch in diameter and four or five inches long. A teaspoonful of the flour to be tested is placed in the test glass and chloroform poured on to fill the vessel to about three-quarters of its length, when it is well shaken, and then placed in an upright position, so as to remain undisturbed until the various substances mixed together have had time to find the level assigned them by their specific gravity, the flour swimming near the surface at the top of the vessel, while the mineral bodies will sink to the bottom. It should be observed that unadulterated flour often shows a slight filmy deposit of a grayish or brownish color, which it must be supposed is stone-dust produced in grinding. A white deposit, however, will invariably indicate an adulteration with one or another of the substances mentioned above. If the materials are weighed before and after separation, the amount or degree of adulteration may be pretty accurately ascertained.

No Bones in the Ocean.—Mr. Jeffrey has established the fact that bones disappear in the ocean. By dredging, it is common to bring up teeth, but rarely ever a bone of any kind; these, however compact, dissolve if exposed to the action of the water but a little time. On the contrary, teeth—which are not bones any more than whales are fish—resist the destroying action of sea-water indefinitely. It is, therefore, a powerful solvent. Still, the popular opinion is that it is a brine. If such were the case, the bottom of all seas would, long ago, have been shallowed by immense accumulations of carcasses and products of the vegetable kingdom constantly floating into them. Dentine, the peculiar material of which teeth are formed, and the enamel covering them, offer extraordinary resistance to these chemical agencies, which resolve other animal remains into nothingness. Mounds in the West, tumuli in Europe and Asia, which are believed to antedate sacred history for thousands of years, yield up perfectly sound teeth, on which time appears to have made no impression whatever.

Renovating Black Silk.—Do not iron black silk. Peel two potatoes, slice them thin, pour one pint of boiling water on them, and let them stand four hours. When ready for immediate use, put about a quarter of a teacupful of alcohol into the liquor. Sponge the silk well on the worn side, rubbing any shiny spots with care; and then roll it tightly around a thick pole. This renews its freshness, and cleans it well.

Writer's Cramp.—A good deal of suggestion is contained on this somewhat prevalent malady in a paper read by M. Bouilland before a meeting of the French Academy of Sciences, which gives an account of researches relative to lesions of the brain. In his former communications he demonstrated that the loss of speech was due to a malady of the third convolution of the left anterior lobe of that organ. He now goes further, and asserts that the three faculties which essentially distinguish man from other animals—speech, reading, and writing—are

each controlled by separate portions of the brain. In his researches he discovered that the paralysis of one of those functions could exist without the others being affected, and he gives as an example a case in which he was called to a consultation on a young man whose avocation compelled him to write continually. At first the patient had felt a slight weakness in writing, then a great difficulty; and finally, an absolute loss of the faculty. The result of the closest examination could not detect any defect in the muscles of the arm or hand, the latter retaining all its sensitiveness and power for every other purpose than that of writing, and all his other functions being normal and in good condition. The conclusion arrived at was that the source of the infirmity must not be sought for in the external organs, but in the center itself of nervous action—the brain. The young man was advised to learn to write with the left hand, which he rapidly succeeded in doing. The defect from which he suffered had long been known as writer's cramp, just as the loss of speech was for centuries termed paralysis of the tongue. Both designations were equally erroneous, both being now attributed to maladies of certain portions of the brain.

The Moons of Mars.—How Prof. Hall, during his telescopic studies, discovered the Martian Satellites, was told by Prof. Newcombe at the American Scientists' Convention during its recent sitting at Nashville.

"Prof. Hall, on the 11th of August last, in looking at Mars, noticed quite near it a small star. He measured its distance from the planet, and found it only a few seconds. He supposed at first it was a fixed star, thousands of millions of miles farther than Mars in the same direction. Then those great enemies of the astronomer, the clouds came up before he had time to decide. He did not get another view of Mars for five days, and during these five days the planet had moved several degrees. There was no way of telling whether the star was still there or not. It was lost. But in looking again he saw a new star; he measured that, and was enabled on the second evening—which, I think, was on the 16th of August—to observe it an hour or so. He then found that the star followed Mars. But he hardly credited that. There must be some mistake in his observations. There was no way of telling whether it was a satellite or an asteroid. He measured it at certain distances, and knew that moreover on the following morning it would be again at the outside of Mars. He would, therefore, look at Mars the following morning to see if it had not gotten around there. In the first part of the evening it was not to be seen, but at 4 o'clock in the morning it came out, and then there was no doubt whatever. The night following this one it was followed by another much closer to the planet, and a little brighter (therefore it must be a second satellite), and on the morning of the 20th of August, we were enabled to telegraph to Europe what I think we may fairly regard as the greatest discovery which the telescope has given to astronomy. Now these satellites are remarkable for not simply belonging to the planet nearest the earth, but also remarkable for their small size and rapid motion. The inner satellite of Mars goes around the planet in less than eight hours, while Mars himself revolves in twenty-four hours. The consequence of this is that this satellite rises in the west and sets in the east; that is, the motion of the satellite around the planet toward the east is more rapid than the planet itself, and thus is an exception to any other of the heavenly bodies."

AGRICULTURAL HINTS.

[The mind is the man. Farming, in the highest sense, is not simply doing the hard work necessary. This can be done by muscle when directed by brains. The true farmer is he who can plan, direct, and control skillfully.]

The Best Seed for Planting.—While you are harvesting, save your best seed. Select carefully and breed to a standard type. The *Prairie Farmer* says on this point: "A farmer, well known for his care in the selection of his seed, made it a practice to set apart each year a certain portion of his fields for the raising of seed. Upon these seed plats none but the most select seed was used, and of a given quality. The best cultivation was given, without regard to cost, and the product of these seed plats was used for the general crops; the top or extra grain being carefully sorted each year, to be again sown for future seed. Thus he always had none but the best and most mature seed for sowing, and always obtained an extra price from others for seed from his fields. But his own selected seed, for these plats, could not be bought at any price."

Peas as Decorative Plants.—The *Revue Horticole* states that the common white Canada peas are being used with good effect as winter decorative plants. They are certainly among the last things we should think of growing for ornament, but the French learn how to utilize everything, and from their account, this plant is not to be despised. The following, which is their method of raising them, is certainly simple enough for any one to undertake.

Plant several peas in a pot filled with ordinary earth and sand. Water them well and place the pot in a dark cupboard, cellar, or any dark place where the temperature is

mild and even. The seed will come up quickly, and under the influence of the darkness, moisture, and heat, they will soon spread themselves and produce an abundance of light leaves. When the plants are high they may be brought into the light, and placed wherever wished. Their white tufts have a charming effect among other plants. If well watered they will remain ornamental for six weeks or more, but as soon as they become green and coarse, they should be thrown away. Nothing is easier, however, than to keep up the succession of these plants, a handful of peas furnishing vines enough for the entire winter.

Dosing Vermin. — "Several correspondents write to announce the complete extirpation of rats and mice from their cow-stalls and piggeries since the adoption of this simple plan: A mixture of two parts of well-bruised common squills and three parts of finely-chopped bacon is made into a stiff mass, with as much meal as may be required, and then baked into small cakes, which are put down for the rats to eat."—*English Standard.*

We've no doubt of it; rats and mice don't like medicine; they don't find it healthful any more than most humans do.

American Fruit in Europe.—Europe is now taking a surprising quantity of American fruit. The purchases have amounted, according to the New York *Tribune*, to over $2,500,000 worth since June, 1876, compared with $600,000 in the same period the year before. Dried apples figure largely in this movement. This country has exported over 12,000,000 lbs. of them since last June, as compared with 522,000 lbs. the previous year. This new addition to the trade of the United States is due to invention, which has occupied itself of late with improved methods for drying and preserving for transporting fruit. The greatest progress has been made in the way of dryers. Within a year some notable inventions in this line have been perfected which are a great acquisition to the resources of the country. The fruit dryer bids fair hereafter to be as much of a necessity to every farming community as the cider mill and the cheese factory.

A Great Yield. — A field at Walla Walla, Oregon, gives 3,000 bushels of clean wheat from fifty acres. In some cases the yield goes up to eighty bushels to the acre.

Greenhouse and Window Plants.—Plants set out of doors for the summer are apt to suffer from neglect. It would conduce greatly to their health to prepare a place for them, a mere frame of boards as wide as the height of the pots; put down a layer of coal ashes on which to set the plants, and then, having put in the pots to allow each plant sufficient room, fill in between them with coal ashes. This will not only prevent drying out so rapidly, but avoid injury to the roots by the sun falling directly upon the pots—an unsuspected cause of much damage. This plan will prevent the plants from being thrown over by the winds, otherwise some other means must be devised. Most greenhouse plants need shade in the hottest part of the day, and should be so placed as to secure this. Several insects that are not known in the greenhouse, may visit the plants when set out, and vigilance is required. Fuchsias should never be turned out into the open ground, unless in a much sheltered place; the hot suns and winds soon destroy their beauty; if taken out of the house at all, the veranda is the best place for them, and if they can be set where the flowers can be seen from below, they will be all the more effective. Keep the weeds from growing in the flower pots.

Strength of Vegetables.—A short time since the asphalt flooring of a skating rink in London appeared to be "blistered" in several places, and it was found that this was caused by the forcing up through seven inches of concrete of some asparagus plants, the roots of which had been left in the ground, which had been part of a garden.

The Flesh of Fruits.—It is generally supposed that the flesh of the fruit provides the first food for the germinating plants of its seeds. Such, however, remarks the *Journal of Chemistry*, is not the case, for here, as in other cases, the first nourishment is drawn from the seed alone. The flesh of the fruit bears no relation to the embryo; it is a kind of outcast substance or excretion of the plant. In most of our cultivated fruit trees, too, the great mass of this flesh is the result of cultivation. Thus, wild cherries possess so little flesh that they do not repay the trouble of plucking. In the mountains of Pontus grapes are found so small that they are not worth eating; and the wild apricot, and often, likewise, the wild peach, possess no flesh at all, the former, indeed, being like a leathery two-valved capsule. The flesh of the fruit of most of our cultivated fruit trees is analogous to the enlarged roots of the turnip and beet, and similar plants, and is simply the product of cultivation. which is much sooner lost again under neglected circumstances than it was originally artificially produced. One of the most able French botanists, Professor Lecoq, of Clermont Ferrand, instituted numerous experiments with various wild plants to induce them to form fleshy roots, and he was almost invariably successful. Just as it is the task of the agriculturist to increase the volume of his roots, so it should be the aim of the fruit gardener to increase the flesh of the pome, stone, berry fruits, and the substances stored up in the cotyledons of nut fruit.

Saving Farm Implements. — A correspondent of the *Ohio Farmer* says: "The manufacturers of farm implements and machines secretly rejoice to see the carelessness and neglect received by the machinery on the farm, for the greater the neglect the

larger sales will they have, for it is a well-known fact that it is not so much to wear and work, but far more to neglect, that can be traced the early uselessness of much of the improved farm machinery now used. Take, for example, the mowers and reapers. If a farmer would carefully aggregate the number of acres cut by the machine during its period of usefulness, before it had to be laid by to give place to a new one, it would cause surprise to find how few acres it had really cut. The mere wear caused by cutting that number of acres did not render it useless, but the neglect it received in the times intervening between the different harvests. But a small percentage of our mowers and reapers ever receive the care they should. Some are rendered useless by careless driving, and by not keeping the parts well oiled and screwed firmly to their places; but by far the greater majority are not attended to properly after the harvesting is over. Some are put away carefully under some convenient tree, there to remain for a year, while others are seen under a shed, with the dirt and gum all still on the different parts, and forgotten till again required for use. Is it any wonder that the manufacturers have to turn out so many machines annually to supply the demand and that the business is so brisk and profitable?

MRS. C. FOWLER WELLS, *Proprietor.*
H. S. DRAYTON, A.M., *Editor.* N. SIZER, *Associate.*

NEW YORK,
DECEMBER, 1877.

SENTIMENT IN EXCESS.

THE case of Mr. Gilman, which was the theme of earnest consideration in the best society of New York and Brooklyn last autumn, is a striking illustration of the tendencies and temptations of the life of men generally deemed fortunate and favored. Surrounded with wealthy friends, conspicuously related to a prominent church, and having a business position which is within the attainment of few, this man yielded to what might be termed the pressure of circumstances, and appropriated to his own use the money of others and forged commercial paper to large amoun s. His Conscientiousness was not deficient as a monitor, for when his criminal doings could no longer be hidden, he went into the hall of justice, and refusing to make a defense, proffered a written confession, in the course of which occurs this passage:

"To sum up briefly, I would say that a decline in business, bad investments, heavy expenses both business and domestic, and personal extravagance have betrayed me. No; I must be just to myself, and confess that I have deliberately walked in the clearest light and knowledge, in the face of the best instructions, into this pit. Some may call it madness; I call it sin."

He was regarded as a man of clear and sound views in business questions, a good adviser and an earnest friend. Hence he was entrusted with large amounts of money, and had under his control at times the entire property of others. He perceived clearly the line of duty, but evidently his Approbativeness, Benevolence, and Social Sentiments were too strong for his Conscientiousness and so overrode its restraints.

It was his kind, indulgent temper which attracted people to him, and at the same time constituted one of his leading weaknesses.

He says on this point himself, that his friends "know that I love better to give away money than to spend it for myself; they know that my thoughts and my interests were more with various charitable works with which it was my happiness to

be connected, than on money-getting by right or by wrong. They will mourn with me that I should have valued the good opinion of good men more than a good conscience and my own self-respect."

He goes on: "They will wonder how it was possible for a man to so far deceive himself as to believe that he really cared for and valued things that were true, honest, pure, just, lovely and of good report, while beneath the smooth surface his heart was rotten and dishonest to the core."

In this respect, poor Gilman did not deceive himself; he was organized to care for and value the pure, just, and lovely; but he lacked the self-culture, the self-knowledge necessary to appreciate and use properly the faculties whose functions relate to the esthetical and humanitarian. A similar but more striking instance is that of the late Henry Meiggs.

Too many sad lapses from virtue and integrity are occurring; too many betrayals of trust. Were they analyzed, it would appear, in nearly every instance, that there was a lack of self-control, and that lack proceeded from self-ignorance. Had Mr. Gilman fully understood his weakness, and taken counsel years ago for their regulation or compensation, we would not have witnessed his distressing fall.

This course was his duty; and it is the duty of every man and woman to study themselves and endeavor to correct irregularities and inharmonies; to suppress tendencies to vice and impropriety. One may possess in good measure qualities relating to what is called man's higher nature, and be weak in moral integrity because of their very influence. The "selfish" faculties are just as useful as the "sentimental," and both require education for their proper manifestation in the character. It is the harmonious inter-operation of these which produce a fine mental balance and a correct life.

WHY THEY DIE EARLY.

GRAHAM, SHEW, AND TRALL.

NOW that Dr. Trall, the eminent Hygienic teacher, has departed at the age of sixty-five, people ask with astonishment why hygienic teachers who live, as it is claimed, according to a better method than is commonly followed by society at large, should not live to a ripe old age. We are not surprised by the question, yet feel sure that if the tenor of their lives in other respects were known, the question would not be asked. When it is understood that Sylvester Graham, Dr. Shew, and Dr. Trall entered upon the investigation of hygienic law and living solely on account of personal ill-health and broken-down constitutions, and by a better mode of living and treatment were arrested in their descent toward the grave, had their constitutions thereby measurably rejuvenated, and were able to prolong their lives many years, it will no longer be a subject for remark that they did not become octogenarians. It should also be taken into account that they were great workers, and each was obliged to stem a current of opposition and public opprobrium; that, indeed, their life was a battle, a struggle, and they were literally worn out.

Sylvester Graham, in early life, was afflicted with dyspepsia and melancholia, and resorted to a simple mode of diet as a last chance, and by its means his health was built up and he became able to lecture before the public, and to write extendedly on the subject of health. He has made for himself a noble monument in his work, "The Science of Human Life," every page of which gleams with intellectual vigor.

Dr. Shew was a photographic artist, or,

rather, a daguerreotypist, and ignorantly and carelessly lived in the fumes of mercury and iodine until his liver became almost disorganized. Learning of the wonderful revolution in the treatment of disease brought about by the renowned Priessnitz, he examined his methods and thus became acquainted with the hydropathic system, and so far recovered his health as to be able to study the healing art, and established in New York and its vicinity health institutions which he personally conducted for a number of years, besides writing several excellent books, the best known of which is "The Family Physician." The overwork which his professional relations induced, combined with his previously injured constitution, broke him down.

Dr. Trall inherited a poor constitution. He was subjected to the old-fashioned heroic drug-treatment until his system was considered hopelessly out of order. He entered the medical profession, studied its methods thoroughly, and became convinced that hygienic living and hydropathic treatment were better than the old system of practice, and for more than thirty years he labored as not one man in ten could labor and live, lecturing to college students, conducting or supervising large health institutions, and writing almost incessantly. Persons who are acquainted with the thirty or forty books which he has written are aware that every page is full of strong, practical thought; that his earnest and intense mental character has thus been crystallized for the benefit of mankind. Dr. Trall's death at sixty-five, then, may be properly set down to the account of early derangement of the constitution, a long career of excessively hard work, and, we may properly add, that too common error of intellectual workers, personal carelessness of self. When his students used to chide him for lecturing and attending to professional business all day and writing two-thirds of the night, his reply was: "Follow my teachings, but not my practice."

He had a wonderful will-power, and felt that he was master of himself and of his surroundings; that he could do anything which ought to be done, or which he wanted to do; and like most physicians, he was far better qualified to judge of other people's difficulties and tell them how to live than he was to treat himself when ill, proving that the physician should generally trust to the medical skill of others in estimating his condition and treating it when ill, and not always attempt to do it himself.

If the world will show us three men who have done as much brain-work as Graham, Shew, and Trall, and fought so fiercely the battle of reform against the current prejudices of the world as they did, beginning as each did with an impaired constitution, it will be time to commence an argument adversely to hygienic living and treatment.

Dr. James C. Jackson, who still continues to work, is another specimen of exhausted vitality and broken constitution, and who was driven to the hydropathic and hygienic systems through ill health. He has thus reorganized his physical functions; and he has thus far been able to nurse himself and recuperate, when ill effects of his former condition are manifested, whereas under ordinary treatment he would have gone to the wall long ago. Like Dr. Trall, he has lived his three-score and five years, but if he does not live to be ninety we suppose the public will say, "There, another example of hygienic living." The truth is, most persons of conspicuous character who have adopted the reformatory diet have done so after becoming dyspeptics from the use of rich and highly-seasoned food, and their

demoralized constitutions have driven them to the better method to avoid the grave. Let children be properly fed and hygienically treated as they are growing up, and then if they continue the right methods of diet and regimen, we may expect octogenarians in great numbers where now there are few who reach the age of sixty.

BEST SCHOOLS.

FOUR or five years ago we had occasion to visit most of the towns and thriving little settlements lying within twenty-five miles of New York, for the purpose of examining briefly their topographical, sanitary, and educational advantages. In the course of the round, we were surprised by the frequent repetition of the statement, "We have the best public school in the State," and a large and expensive building was usually pointed at as a witness for the assertion. It is gratifying, indeed, to one who understands the relation of the school to the intellectual and moral growth of the community, to learn that well-equipped and well-conducted schools thickly dot the environs of a great city. Their influence is salutary in counteracting the miasms of illiteracy and immorality which emanate from the promiscuous aggregation of humanity in a metropolis, and so they help much to raise the general mental tone of the whole region.

During the past two years or more we have been so related, that the practical working of some of these "best" schools has been more or less under our notice, and it has not realized the expectations which were raised at their first introduction. We have seen that ambition to show a much-diversified curriculum, to have high departments of study, and public "examinations" and "commencements," largely controls the measures of the trustees. We have seen, also, that thoroughness in a few branches of study is less esteemed than skimming a large number. For instance, a child ten years of age would be required to procure in the outset of a term, seven, eight, perhaps even nine text-books on as many different subjects, and be assigned lessons in them for every day. The impossibility of thoroughness under such a system, to say nothing of the mental damage wrought, is evident.

They are evidently pursuing a similar policy in Pennsylvania, as Mr. Wickersham, the Superintendent of Schools for that State, said at a meeting in Louisville, Ky.:

"I have seen large classes come out of our High School, and go back home without a qualification for anything. Our people are partly right in saying that the common schools are not doing what they should for the common people."

What would we have? First, teachers who are competent to teach, both by organization and thorough familiarity with the subject-matter of their teaching. Second, few text-books, and few lessons to be learned at home. We would not require a child of ten or under to learn more than one lesson at home, and we would not have him or her study more than three subjects at one time. Third, a complete understanding and mastery of each lesson by pupils, as a condition of advancement.

Many of the teachers, particularly of children, exhibit a restless desire to introduce esthetic and scientific branches of study, notwithstanding the obvious fact that they can not do so without neglecting the plain and substantial departments. The course involving the three "R's" and plain geography and elementary history is hurried through, that technical studies may be entered upon. And much credit is affected by her who says that she teaches botany,

chemistry, mineralogy, Latin, etc. We believe in imparting a knowledge of natural science to children, and the good teacher can do so by occasional lessons, which may furnish a pleasant and instructive diversion to her classes; but how injudicious it is to neglect the subjects essential to a good knowledge of the affairs of every-day life, and to a successful business career. An educational organ recently published this item:

"At an examination of 150 applicants for schools, embracing high-school, college, and university graduates, from all parts of the country, many failed to get even the lowest grade certificate. They failed in one or more of the common studies—arithmetic, grammar, geography, reading, and spelling."

Will the trustees and teachers of our "best schools" consider this?

JUST A LITTLE PREJUDICED.

AN exchange informs us that "Dr. Hollis, in an article on mental physics," says:

"It is preposterous to expect that similar cells are reserved for similar functions in all human brains, knowing what we do of the great diversity in man's mental nature, his various occupations, proclivities, and talents. Beyond the fact that there exists in our brains a posterior or retentive system, and an anterior or expressive system, our knowledge of this organ will not at present permit us to go."

Our readings in anatomy have led us to believe that organisms in the same class are similar in function. Prof. Ferrier affirms, as the result of his experiments, that the same convolution in the brains of different monkeys responded under excitation with a like muscular movement. So, too, it proved in his examination of the brains of different dogs, or rabbits or other animals. Anatomists know that the motory and sensory nerves in man do not exchange function, so that the cells which make up their tissue severally must be "reserved" for the motory or sensory property in particular. So, too, we know that the nerves of special sensation, be they instrumental in hearing, or seeing, or smelling, or tasting, or touching, have their several relations to these processes of mental apprehension. The diversity, therefore, of physical sensation is due to special nervous function. Nature is ever harmonious and consistent in her ordering of life and development; and the logical sequence of the diversity of nervous function in our sensational apprehensions is a diversity of nervous function to subserve "the great diversity in man's mental nature."

Look back a page or two, dear reader, or recall what is reported of the eminent anatomist, M. Bouilland, on "Writer's Cramp," as a further confirmation with regard to special nervous centers.

But the writer first quoted makes an acknowledgment of a division of faculties in the second member of the paragraph, which is sufficient in its warrant for the validity of the idea upon which the system of phrenology is founded. Dr. Hollis' caution in his statement is evidently due, in great measure, to his knowledge of cerebral physiology, which we infer, like that of most metaphysicians of the old school, is not extensive.

UNBELIEF vs. BELIEF.

IN a notice of a book recently published by S. R. WELLS & Co., the literary man of the *Christian Weekly* thus declares himself:

"We have no faith in Phrenology. This book is based on Phrenology. Therefore

we have no faith in this book. We believe, nevertheless, that in family government, and in school training as far as possible, individual temperament and peculiarities ought to be studied. So far we agree with the book."

The reader will perceive that in one breath a denial and an acceptance of Phrenological principles are asserted. Phrenology, as we understand it, is but the study of individual temperament and peculiarities. Our literary friend, like most intelligent people of the day, has the good sense to appreciate the utility of principles and methods which the teachers of Phrenology for the past forty years have been inculcating, and which have been largely absorbed by the thought of the day. We hear eminent divines asserting phrenological truths from the pulpit; we see physicians applying them at the bedside; we see teachers employing them in their class-rooms. Men of the noblest and purest stamp declare to us that what they possess of health, fortune, and happiness, they owe to phrenological teaching.

Perhaps our friend would call the enlightening and life-giving truths set forth by Gall, Spurzheim, Broussais, Combe, Macintosh, Bell, Caldwell, Mann, and the rest by some other name, just as *savants* in Germany and France are disposed to do. Perhaps we would gain many more avowed friends if we should speak of mento-psychology, or mento-physiology, or menology, or, as they say in Germany, psycho-physiology, and relegate "Phrenology" to that limbo in which the scientists awhile ago immured "Astrology" by substituting the less expressive "Astronomy."

Our Mentorial Bureau.

[In this Department will be noticed such matters as are of interest to correspondents and to the general reader. Contributions for "What They Say" should be brief, pointed, and creamy, to secure publication.]

To Our Correspondents.

QUESTIONS OF "GENERAL INTEREST" ONLY *will be answered in this department. But one question at a time, and that clearly stated, must be propounded, if a correspondent shall expect us to give him the benefit of an early consideration.*

IF AN INQUIRY FAIL TO RECEIVE ATTENTION *within two months, the correspondent should repeat it; if not then published, the inquirer may conclude that an answer is withheld, for good reasons, by the editor.*

WE CANNOT UNDERTAKE TO RETURN UNAVAILABLE *contributions unless the necessary postage is provided by the writers. In all cases, persons who communicate with us through the post-office should, if they expect a reply, inclose the return postage—stamps being preferred. Anonymous letters will not be considered.*

ORGANIZATION OR EDUCATION.—G. A. —Organization, of course, has a primary influence upon one's thoughts and actions, and therefore it may be inferred that its influence is stronger than the impressions of education; the effect of education is that of a modification or change in some respects of tendencies of the organic endowment; not changing the original impulses, but giving them a different tone or form of activity. A man with large Destructiveness, a strong passionate element, grown up without training, intellectual or moral, will show what we term low habits and a spirit opposed to moral propriety and social utility. But such a man, when early placed under the influences of good training and culture, with refined associations, would be likely to become an earnest, thoroughgoing worker, in orderly directions, and be a very powerful element in working out principles of social utility and progress.

HUNTING FACULTIES.—G. C. L.—One who is fond of hunting, has an active temperament, rather strong perceptive faculties, a head rather broad in the region of Destructiveness, with a comparatively large back-head, and is muscular in correspondence with his basilar brain development.

PALLOR OF FACE. — *Question:* I am pretty strong, lifting five hundred and seventy-five pounds with the "health-lift," tolerably heavy for my height; in short, as strong and as heavy as most of my associates. Yet I often hear it said of me, "He looks as if he had not a drop of blood in his face." Oblige by stating what causes this pallor.

Answer: It may be constitutional with you; in other words, you may have inherited a compact muscular organization, yet with it some derangement of an internal organ, like the liver or the kidneys. Take a sponge or towel bath in the morning, accompanying it with a brisk hand rubbing; these will improve your circulation, and will have a tendency to give your skin a more sanguinary expression. We would not advise you to "lift" too much, as you may injure yourself by a strain.

SOMEWHAT PERSONAL. — Our friend "D.," of Albany, has favored us with another long and sprightly communication, which is at once critical, laudatory, exceptional, and condemnatory. "D." thinks we do not set enough store by "evolution." He has evidently swallowed the whole hypothesis, even outdone Darwin, Huxley, Tyndal, Spencer, and the rest who, according to their own statements, don't see as much potency in a bit of matter as "D." does. Besides, "D's." organs of "Credibility and Respect" are great, if his vigor of assertion may be taken as evidence of conviction. He has gobbled with affectionate unction the extravagant notions of "theosophists" and anti-religionists with regard to the derivation of Christianity, evidently ignoring what Oriental scholars like Max Müller and Professor Robertson Smith have wri'ten. He mixes up Buddhistic and scientific ideas with respect to the formation of the earth and its ultimate state in a style that is refreshing. Certainly his logic abounds in nebulæ. But we can excuse a great deal of "D.'s" extravagance of view on account of his earnestness in advocating the facts and philosophy of Phrenology, as well as on account of his omnivorous reading, the latter, we fear, having produced a sort of mental muddlement. We've no objection to "D's." letting himself out to us occasionally, as the spice in his writing has an agreeable mental stimulus for us.

SOMNILOQUENCE. — E. D. W. — This may be occasioned by stomach derangement. In fact, we think that most cases of talking in one's sleep are so occasioned. People who eat heavy meals at night are disturbed in their sleep by dreams and nervous excitement; very often children will talk in their sleep; so, too, people who are affected by emotional excitement, or have worked excessively, are inclined to be wakeful and loquacious at night. Most instances of somniloquence are produced by abnormal physiological conditions.

CAUCASIAN RACE.—Most of the geographies used as text-books in the schools contain brief descriptions of the races of the earth. "Caucasian" is the term applied generically to the white races. The Anglo-Saxon is one of the races belonging to the Caucasian division. Some authorities claim that the white race found its origin in Asia-Minor, or in the neighborhood of the Caucasus Mountains. The "Garden of Eden" is thought by some to have been located in Asia-Minor. Authorities now differ much with regard to the origin of man; some asserting that all nations, tribes, and tongues proceeded from one family, others asserting that the three, four, and five, or more grand divisions into which they distribute mankind, proceeded from as many distinct and original families or pairs.

DIPHTHERIA. — T. E. — An attack of diphtheria is usually preceded by those symptoms which are generally attributed to a severe cold, such as chilliness, languor, mental depression, cold sweat, general discomfort. The diphtheritic attack, *per se*, comes on a day or two after the "cold" has been contracted and evinces itself by swelling of the glands and membranes of the throat, and the deposit or growth of morbid matter called false membrane. Unless this deposit be arrested, suffocation is the result. Methods of cure differ; the simplest being, of course, hygienic, which includes a warm bath, a wet-sheet pack, cold applications to the throat, outside; gargling the throat with cold water, swallowing small bits of pounded ice, swabbing out the throat, and where the deposit of false membrane has become extensive, the application of caustic for its removal. In the outset of an attack of diphtheria, one should not eat, for the disease is largely due to a disturbance of the stomach and of the excretory system. Abstinence will afford the system an opportunity to regulate itself.

STUDY OF THE CLASSICS.—J. H. L.—The perceptive organs, Causality, Constructiveness, Ideality, are among the parts of the brain which are exercised by the study of the classic tongues. When you read the Greek and Latin poets, Destructiveness, Combativeness, and Amativeness, Friendship, and other organs will come in for their share of attention, according to the subject matter.

STRASBOURG CLOCK.—Into the composition of this wonderful clock, brass and iron chiefly enter. We are not able to give you the exact height, but would infer from sketches which we have seen, that the case stands upward of thirty feet. Dasypodius, a skillful clock-maker, has the honor of producing this

remarkable mechanism. Among its performances are, showing the course of the stars from day to day; indicating the date, both according to secular and ecclesiastical reckoning; showing the phases of the moon, from the beginning to the end of the lunar month; indicating the mean time. Besides these, a figure of an angel strikes the hour, and another figure turns over a sun-glass to mark its expiration; a skeleton representing Death strikes the hour of noon. As the quarter hours pass between 11 and 12, symbolical figures of Childhood, Youth, Manhood, and Old Age appear successively and pass around Death. A figure of the Saviour stands in a prominent niche, and at noon carvings of the Twelve Apostles advance singly and move around Him, and just as the last of the twelve appears, a cock, perched on one of the towers, advances, claps his wings and crows. Each day of the week has a mythological representative, which comes out at the beginning of the day and returns at its close.

What They Say.

GOLDEN FRIENDSHIPS.—"Friendship is a golden chain," says the poet, "that unites kindred hearts through links of mutual sympathy." What the poet says, everybody says, if he is a right popular poet; so we have friendship going the rounds of the sentimental world by the name of "a golden chain." The metaphor sounds pretty, and is, unconsciously, well adapted to the idea it represents in its literal and modern signification. We sometimes catch glimpses of the long ago, when friendship had for its meaning a special and devoted interest in the tried and proven few, and a manifest Christian desire for the well-being of all. No wonder that old sentimentalists, in their silent musings on the sweet and endearing mysteries of friendship, linked its tender emotions poetically into a chain which they called "a golden chain," in comparison with the purest and most precious of metals. Brighter than the glittering ore, purer than the coin from the mint, delicately visible, yet ever felt, was this same golden chain; so delicate that the rubbish of ages seems to have crushed it out of existence; or so coarse and insensible seems human nature to have grown, that should the gentle links essay to twine themselves around the obdurate heart of the average individual to-day, the touch would fail to awaken sensation.

The cry *now* is for something tangible to conduct interest and appreciation to any foreign point, and that tangible something is the very metal, or its representative, dug from the ground under our feet—emblem of the invisible gold of long ago. This modern patent on friendship is better adapted to the comprehension of the masses than was the ancient article, in that there is nothing invisible about it. It lifts up its voice on the street, the highway, and in the sanctuary. It can be discerned in the bowing of lofty heads and clasping of jeweled hands; and it can be felt—yes, *felt* only by the brown-handed sons and daughters of toil, who are brushed past by the fashionable shop-goers on the stone pavement, or by the "brethren" and "sisters" in the aisles of the common church. We should weep to believe that the sweet spirit chain of old, affrighted by the vain glitter of its rival and successor, had flown from the earth where its sacred name is so wantonly profaned. We yet find, in high as well as in low places, an occasional friendship, as rare and sweet as ever blessed an earlier age, pure as its purest emblem, scenting the moral atmosphere like a flower rescued from the blight of Eden. But oh, how rare that flower! how scarce that gold! Yet are we happy to know that there are left a few straggling Levites who courageously refuse to bow to the golden calf; and we have hope left for the dawn of a brighter day, when this money-god will be dethroned amid the triumphant shouts that shall ascend from the invulnerable heroes who have the world's salvation in trust. The haughty monarch must flee before the tidal awakening of a universal intelligence that understands human rights and reaches forth its hand to take the luxury of mental freedom without asking any man's yea or nay. People will know each other better, and when mind meets kindred mind, the relationship will be acknowledged before the world, though it exist between a hod-carrier and a president. MINNIE MYRTLE, JR.

BASHFULNESS AND ITS CAUSES.—George Combe says, in his "Lectures," speaking of Professor Mapes' daughter, that bashfulness is an affection of Self-esteem. Although it is the acme of presumption for an amateur to controvert the opinion of so distinguished a man—one for whom we entertain the greatest possible reverence and admiration—we yet feel constrained to the belief that he was in error. The assertion is disputed substantially by able phrenological teachers and authors, among whom we can name Professor Fowler, Nelson Sizer, etc. Approbativeness is defined as a love for the good opinion of others, or the praise of others. Self-esteem loves self, and cares not a whit for another's opinion, thinking self best and most entitled to consideration. Now we can not consider it possible for such a state as the one denominated "Bashfulness" to proceed from one of confidence in self, belief in one's own capacity—in a word, Self-esteem. But it can readily pro-

ceed from Approbativeness, which desires and labors for the respect of others. In the bashful state one is humbled, abashed, shrinking, trembling, etc., and why? Not because they feel independent, high-minded, proud of self, and conscious of sufficiency of innate power, all of which is the origin of the self-esteeming faculty; but, on the contrary, because of a negative endowment of this sentiment, and a largely-developed organ of Approbativeness, joined to full or large Cautiousness—the former giving love for others' opinions, and the latter making fearful of not receiving the so-much-desired object of gratification. The man in whom Self-esteem is largely predominant, will seldom be found manifesting bashfulness, and when such an individual is found, an examination will disclose in the same person large Caution and small Combativeness. Of two men equally endowed in other respects, yet differing in Combativeness, a marked difference in the matter of presence of mind will be observed, and when you give to the one moderately endowed with Combativeness an increased amount of Cautiousness, a vast change in mental action takes place, and always more and more verging toward the bashful.

Our own observation and experience confirm us in the belief that the bashful man will, in nine cases in ten, be found with Self-esteem and Combativeness only moderate, and Approbativeness and Cautiousness large. We conceive the following combinations most favorable to bashfulness: 1st. Large Approbativeness and Cautiousness, with deficient Self-esteem and Combativeness. 2d. Large Self-esteem, Approbativeness, and reflectives, with small propensities and large Caution. Perhaps ninety-nine marked cases out of a hundred would be filled by one or the other of these combinations. In the second, though Self-esteem is strong, the large Approbative faculty, highly excited by large Caution, and enlightened as to one's nothingness by intellect, without the support of powerful Combativeness in particular, which laughs at danger and disputes the fancied evils of Cautiousness, carries the day, and a feeling of timidity and lack of confidence usurps that of strength of belief in a capacity sufficient to breast the storm at any time likely to burst upon us.

We should be glad to hear from the learned in the science, knowing that assertions from Combe are always entitled to the weightiest consideration and respect. C. M. ALEY.

[We think that on p. 175 *et seq.* of his "Lectures," Mr. Combe most clearly analyzes the function of Self-esteem and does not take ground adverse to the views of our esteemed correspondent. We presume that the statement quoted by Mr. Aley means that bashfulness is traceable to a deficiency of Self-esteem. We can also conceive of bashfulness in one who has both Veneration and Self-esteem large, with moderate Combativeness.—EDITOR.]

PHYSIOGNOMY SHOWS THE MIND WITHIN.—The writer can, in nearly every case, give a correct description of character, and often state the relative size of the organs, from no other means than the expression of the subject's countenance. This leads him to believe, if not to know, that Physiognomy is far from being a humbug. The failure of people to believe in this science is very evidently owing to their lack of Human Nature. Those who have this organ large are always judicious observers, and observation never fails to confirm Physiognomy.

It is claimed by non-believers that Physiognomy is not a true science, because, as they say, many hypocrites and rascals have almost angelic countenances; while on the other hand, many strictly moral persons have faces worthy only the most profligate and degraded. Now, it is a well-known fact that no person can be angry and at the same time avoid giving to his face an angry expression. It is impossible to exercise the organ of Mirthfulness without putting on a corresponding physiognomy. No one can exercise the organ of Firmness without compressing his upper lip, and at the same instant wearing a stern expression of countenance. Indeed, it is a well-substantiated fact that every organ of the mind has its corresponding "pole" in the face, and no one organ or combination of organs can be brought into action without showing a corresponding physiognomy. To nicely discriminate and correctly judge as to a person's character, from the expression and shape of the face, requires a good share of human nature. You look at a piece of dry-goods, and from its general appearance pronounce it an excellent article. But the experienced merchant, who is a competent judge, may know very well that you sadly mistake it. Just so with regard to Physiognomy.

Again, the faces of those whose cares have been great, always have a care-worn look. The faces of those whose lives have been lives of sadness, always have a sad expression. And those who have had but little to do with either of these, invariably have a free and easy expression. Injure any part of a natural object, and you necessarily injure it as a whole. Let a child, or even an adult, fall down and injure any part of the body, does not the expression and very actions of that individual point to the injury? Can you not tell whether a person is angry, sad, pleased, or injured without his even uttering a single syllable? Is there not a difference between the facial expression of a rowdy and that of a gentleman? As the different parts of man's organism are closely united, a sensation felt at any one point is instantly telegraphed, as it were, throughout the body, and immediately

comes to the surface in the form of physiognomical indications. J. W. LOWE.

SOUTHERN VEGETARIAN GROUP HOME.—In this semi-tropic climate nine-tenths of the people live (I may say, die) on pork and smoked bacon, with fine flour, beans, and cabbage cooked with pork, etc. Whisky and tobacco are almost universally used, and very little of good vegetable food. I am anxious to hear something more of the Massachusetts correspondent, as well as any others who may decide to assist in the matter of forming such an organization. Let us who favor such a "Home" first effect an intercommunication, discuss all questions relating to the welfare of the scheme, such as the particular part or point of the country best suited for the founding of the Home, etc. Then, who shall be admitted, and upon what terms. But the main thing is to establish communication with each other. I am greatly in favor of a "Home," and trust that enough may take hold to push forward to completion a movement for introducing simple and healthful ways of living and a better social system. I will most cheerfully cast in my mite. J. S. C.

WISDOM.

"Think truly, and thy thought
Shall be a fruitful seed."

ONE of the best mottoes: Remember to-day will never dawn again.

EVIL, like a rolling stone upon a mountain top,
A child may first set off, a giant can not stop.
—TRENCH.

A GOOD book is the precious life-blood of a master spirit, embalmed and treasured up on purpose to a life beyond life.—MILTON.

A FRENCHMAN being asked his rules for happiness, replied: "I have three rules: the first is occupation; the second is occupation; the third is *occupation*.

WORDS are like leaves; and where they most abound,
Much fruit of sense beneath is rarely found.
—POPE.

AGE is not all decay; it is the ripening, the swelling of the fresh life within, that withers and bursts the husk.—GEORGE MACDONALD'S "Marquis of Lossie."

I DO not hesitate to maintain that education must fail as long as we continue to think that children are born alike, and may receive with equal advantage every kind of education.—SPURZHEIM.

GO OUT of doors and get the air. Ah, if you knew what was in the air! See what your robust neighbor, who never feared to live in it, has got from it—strength, cheerfulness, power to convince, heartiness and equality to each event.

HERE is a variation on a rhymed proverb which the temperance societies might very appropriately set to music and sing:

Early to bed and early to rise
Makes a man healthy, wealthy, and wise;
But early to ryes and tardy to bed
Makes a man's nose turn a cardinal red.

A MAN'S first difficulties begin when he is able to do as he likes. So long as a man is struggling with obstacles, he has an excuse for failure or shortcoming; but when fortune removes them all, and gives him the power of doing as he thinks best, then comes the trial.

NOTHING can be more misplaced than to speak of physics poetically, and lavish figure and ornament where there should be only method, clearness, and truth. It is the quackery of a man who would pass off false systems under cover of an empty noise of words. Weak minds are caught by the bait, and strong minds disdain it.—VOLTAIRE.

MIRTH.

"A little nonsense now and then
Is relished by the wisest men."

IF you have religion you need not tell people about it; they will find it out after trading with you for a little while.

I FULLY believe in predestination; if a man will drink whisky and won't work, he is predestined to become ragged and go to the devil.—JOSH BILLINGS.

"HI! where did yez get them trowsers?" asked an Irishman of a man who happened to be passing with a pair of remarkably short trowsers on. "I got them where they grew," was the indignant reply. "Then, by my conscience," said Paddy, "you've pulled them a year too soon!"

A PARTY were enjoying the evening breeze on board a yacht. "The wind has made my moustache taste quite salt," remarked a young man who had been for some time occupied in biting the hair that fell over his upper lip. "I know it," innocently said a pretty girl. And she wondered why all her friends laughed.

HERE is something Stanley should see: A quaint character was "Old Dan," as he was called. His remarkable stories were known far and wide in the community where he lived. This is his latest: "I bought a geography and liked it first rate. I found everything I looked for except 'Jordon's stormy banks,' and to save my life I couldn't find them. Why, I even found the 'spring run' that run behind my daddy's house, but I couldn't find 'Jordon's stormy banks!'"

Library.

In this department we give short reviews of such New Books *as publishers see fit to send us. In these reviews we seek to treat author and publisher satisfactorily and justly, and also to furnish our readers with such information as shall enable them to form an opinion of the desirability of any particular volume for personal use. It is our wish to notice the better class of books issuing from the press, and we invite publishers to favor us with their recent publications, especially those related in any way to mental or physiological science.*

HIS GRANDMOTHERS. A Summer Salad. 16mo, pp. 192, paper 50 cts. New York: G. P. Putnam's Sons.

A picture is offered to the fun-reading public in this well-printed little volume of the life led by a young married couple with two grandmothers, both, it appears, being next of kin (in the ascending series) to the husband. The first chapter tells how they happened to pop upon the household of the young people. Both had been invited to come, but "grandson Winthrop" hadn't the slightest idea of realizing his invitation. Certainly no inclination that way.

The "taking off" of peculiar superannuation is in many respects vivid enough, but we think that the writer in the endeavor to be humorous inflicts something libellous now and then upon the grandmother-race by conduct imputed to "Grandmother Ogden." We are told, too, that the young people have received sundry articles of household equipage from the grandmothers, and the worst of them owns some right in the grandson's house, which should soften the tone of their literary treatment, notwithstanding the recited aggravations. Certainly Mrs. Ogden gets off a good many economical animadversions on the "shiftless" style of modern living. And we are half inclined to think that the author of the book has a sly motive in the way of reproving the spirit of extravagance which dominates in many households. Whether he has or not, some strong points with regard to family *ménage* are made.

ELSIE'S CHILDREN. By Martha Farquharson. 16mo, illustrated, pp. 340. Price $1.50. New York: Dodd, Mead & Company.

At the first introduction a reader would be likely to include this volume among the numerous childish stories and sketches which have found a remarkably free course during the past summer. The author certainly begins in a style which, aside from the title, has some warrant for such a hasty judgment. But Mrs. Farquharson is an author whose reputation and previous books lead us to expect a different treatment of her subject from that which is almost stereotyped in the hasty "baby" books of the day. She is experienced in portraying the characteristics of our boys and girls; all her volumes of which we have any recollection, viz., "Story of Elsie," "Old-Fashioned Boy," "Our Fred," show power of discrimination and a superior faculty in this specialty. "Elsie's Children" is a sequel to "Elsie's Motherhood," a volume which has found its way into many a family. Elsie, in this new *role*, has a "houseful" of children, and as there are several most excellent grown-up relations who take a deep interest in the little ones' welfare, they have a "good time" pretty much all the while, except when suffering the painful or disagreeable penalties of a madcap freak. The charm of wealth, ease, and refinement lights up the course of the story, and opportunities are not lost for the introduction of moral and religious instruction. This latter feature has made Mrs. Farquharson's books acceptable in some quarters for Sunday-school libraries. Barring a little extravagance of style, which is doubtless owing to the author's temperament and social environment, the book is creditable, and will be welcomed by young people who have read any of the author's other publications.

TRANSMISSION; OR, VARIATION OF CHARACTER THROUGH THE MOTHER. By Georgiana B. Kirby. 12mo, paper, Price 25 cts. New York: S. R. Wells & Company.

Within the space of seventy-two pages we have in this pamphlet a comprehensive discussion of the principles and facts relating to that most interesting subject, the transmission of character from parent to child. The author writes from the point of view of the original investigator, and adduces many incidents from life in support of her leading proposition that to the habit, avocation, and tone of mind of the mother the characteristics dominating in the temperament of the child are chiefly due.

The requirements for a proper marriage and its concomitant, true domestic happiness, are indicated with a vigor and a heartiness which show the writer's appreciation of home; and she also discusses the bearing of marital harmony upon social progress, discerning in the right relation of the sexes a chief condition of true national growth and prosperity.

The book was written for the general reader, and its graceful style and delicacy must please, while its subject-matter instructs.

Desirous of giving it the wide distribution it should have, the publishers have put it in a neat dress and fixed the price so low that all may procure it.

THROUGH ROME ON: a Memoir of Christian and Extra-Christian Experience. By Nathaniel Ramsay Waters. 12mo, pp. 352. Price, cloth, $1.75. New York: Charles P. Somerby, Publisher.

A very frank narrative this of the writer's religious, or rather, as may be more appropriate, sectarian life. Finding, while a young man, that

"the dogmatic foundations of Protestant Christianity rest on sand," he embraced the Roman Catholic order, and for eight years endeavored to practice in accordance with its precepts, but it becoming clear to him, by this experience, that "the liberal principle and the ecclesiastical are in vital antagonism," he withdrew from that Church and went "on." He tells us that his conscientiousness in childhood was morbidly sensitive, and subjected him to many painful experiences, and led him to make disparaging comparisons of the professions with the every-day conduct of friends whose "standing" in the Church was high. His juvenile readings were miscellaneously mixed — sermons, allegories, moral essays, biological treatises, romances, and novels, the latter being markedly in the majority, and many of them of the strongest type, such as Fielding's and Smollett's. Perhaps this miscellaneity of literary influence did not injure his religious apprehension; at least he thinks not, for in his Church career his conscientiousness was a dominant element, and would not permit him to accept a theory or system without conviction of its soundness. Thus he "was a tough young Christian from the start."

The volume reads like a confession, yet has so much of the argumentative character that, like Rousseau, the author appears to aim at excusing his course and inculcating his opinions. He is frank and clear in statement, making no effort to disguise his views with reference to Protestantism or Papacy, and attacking their most vital centers of doctrine with a boldness which must startle any orthodox reader. The book is a strong one in the interest of free thought.

HOSPITALS: their History, Organization, and Construction. Boylston Prize Essay of Harvard University for 1876. By W. Gill Wylie, M.D. New York: D. Appleton & Company.

Collegiate prize essays are not always of practical value, and hence the majority of them fail of notice by the public. When, however, such a value can be attached to one, the prestige given it by an institution like Harvard University will not fail to secure for it a general consideration, at least among the class specially interested in the subject treated. In the matter of hospitals the public has an interest equally with physicians, hence Dr. Wylie's admirably written and comprehensive volume should have a wide reading. It is not the work of a "literary doctor," but a carefully-thought-out discussion of the methods of treatment, arrangement of patients, and adaptation of buildings by one whose personal acquaintance with hospitals forms the basis of his opinions. We find scarcely an allusion to the part which drug medicaments perform in an infirmary, but a vast deal concerning the application of the principles of hygiene, and the need of skillful nursing; in fine, the author is most painstaking in showing that the successful management of the sick depends chiefly upon the purity, ventilation, comfort, and order of his environment and the intelligence of his nurse. How these important features may be obtained is considered with much detail, plans of arrangement being given in illustration of the text, and leading authorities, foreign and American, being drawn on for information or opinion. The enlightened reader can not but approve the design and suggestions for a "general hospital" and those for a "small hospital," so thoroughly are the principles of sanation considered. It may be superfluous counsel, but we would advise the health officers of our cities and towns generally to read this essay.

PUBLICATIONS RECEIVED.

FIFTY-NINTH ANNUAL REPORT of the Trustees of the New York State Library, for the year 1876. During that year, 3,505 volumes were added; a list of their titles is given. The total number now in the library is 100,772, of which 27,737 are in the department of law.

THE ATLANTIC MONTHLY'S announcement for 1878 contains many attractive features to lovers of good literature. Special inducements are offered to subscribers. Hurd & Houghton, New York, publishers.

DEFECTS OF HEARING and other Evils: the result of enlarged or hypertrophied tonsils. By A. W. Calhoun, M.D., Professor of Diseases of the Eye, Ear, etc., in the Atlanta Medical College. Read before the Medical Association of Georgia.

ADDRESS delivered at the Third Annual Meeting of the Association of Alumni and Officers of the Medical Department of the University of Buffalo. By Frank H. Hamilton, A.M., M.D., LL.D.

FIFTEENTH ANNUAL ANNOUNCEMENT of the New York Medical College and Hospital for Women. We learn that the session for 1877-8 of this useful institution is largely attended. It affords a wide field of medical study.

THE INFORMER, published by an association of philanthropic gentlemen at Elgin, Ill., is an advocate of reform in the practice of alcohol-drinking and tobacco-using, and is well conducted. We trust that it finds a liberal support.

A BRIEF ADDRESS on How to Come to Jesus. By D. L. Moody. Rev. Dr. E. B. Beadle's statement; Mr. Sankey's Farewell Hymn to Philadelphia; Fine Selections from various authors, etc. By W. W. Broom. Philadelphia, Pa.

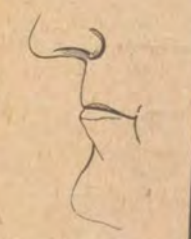
THIRTEENTH REPORT OF THE TRUSTEES of the City Hospital, Boston; with reports of the superintendent and professional staff, etc. An interesting document concerning an admirably conducted institution.

NEW

PHYSIOGNOMY

or Signs

OF



CHARACTER.

As manifested in Temperament and External Forms, and especially in the Human Face Divine. By Samuel R. Wells. 800 pages, more than 1,000 illustrations, with frontispiece, portrait of author. Heavy tinted paper, extra muslin; price, by mail, post-paid, $5.00; full calf, marbled edges, $8.00; turkey morocco, full gilt, $10.00.

THIS is a comprehensive, thorough, and practical work, in which all that is known on the subject treated is Systematized, Explained, Illustrated and Applied. Physiognomy is here shown to be no mere fanciful speculation, but a consistent and well-considered system of Character-reading, based on the established truths of Physiology and Phrenology, and confirmed by Ethnology, as well as by the peculiarities of individuals. It is no abstraction, but something to be made useful; something to be practiced by everybody and in all places, and made an efficient help in that noblest of all studies—the Study of Man. It is readily understood by all, and as readily applied.

Previous Systems are given in this work, including those of all ancient and modern writers.

General Principles,—the Physiological laws on which character reading is based.

Temperaments—Ancient Doctrines—New Classifications now in general use here.

Practical Physiognomy—General Forms of Faces—Eyes, Mouth, Nose, Chin, Jaws, Teeth, Cheeks, Forehead, Hair, Beard, Complexion, Neck, Ears, Hands, Feet, Voice, Walk, Laugh, Dress, etc.

Ethnology—The Races, Caucasian, Indian, Mongolian, Malay, and African.

Physiognomy applied to Marriage, Training of Children, to Personal Improvement, to Business, to Insanity and Idiocy, to Health and Disease, to Professions, to Personal Improvement, and to Character Reading, Utility of Physiognomy.

Animal Types—Grades of Intelligence, Instinct and Reason, Animal Heads and Animal Types, seen among Men.

Graphomancy—Character revealed in Handwriting, Palmistry, "Line of Life," illustrated.

No one can read this Book without interest, without real profit. "Knowledge is power," and this is emphatically true of a knowledge of men—of human character. He who has it is "master of the situation;" and anybody may have it who will, and find in it the "secret of success" and the road to the largest personal improvement and usefulness.

NOTICES OF THE PRESS.

"Among those who have contributed to the advancement of the Science of Physiognomy in this country, the author of this book is honorably distinguished, and we feel pleasure in bearing testimony to the conscientiousness and ability with which he has executed the laborious task that he imposed upon himself."—*New York Herald.*

"The most complete hand-book in the language; a man who can not find amusement and instruction in Mr. Wells' book, must have a very stupid face indeed."—*New York Tribune.*

"Take such a volume as this, and every one must acknowledge that physiognomy opens a wide field for interesting investigation."—*New York Times.*

Agents may do well to canvass for this work. Address, S. R. WELLS & Co., 737 Broadway, N. Y.

Given as a Premium for 5 Subscribers to the "Phrenological Journal" for $2 each.

THE PHRENOLOGICAL JOURNAL

AND

SCIENCE OF HEALTH

BRAIN IN THE SKULL.

THE SKULL.

THIS publication is widely known in America and Europe, having been before the reading world nearly forty years, and occupying a place in literature exclusively its own, viz.: the consideration of the SCIENCE OF MIND, the chief among the subjects to which human thought is directed. PHRENOLOGY unfolds the relations of Mind and its physical instrumentalities; shows how the multifold diversities of human character and capacity are related to universal laws, and by a positive analysis of individual mentality ministers to individual usefulness, designating special aptitude, and indicating the methods by which mental and physical deficiencies may be remedied. As an agency in training the young, in correcting and reforming the vicious, and in controlling the insane, its value can not be estimated.

PRICE REDUCED, FOR 1878, FROM $3 to $2 A YEAR.

In consideration of the continued hard times, and wishing to increase a knowledge of and interest in Phrenology and Health Reform, it has been deemed best to reduce the subscription price. The size of THE JOURNAL must of necessity be reduced somewhat, but this change will not be in proportion to the reduction in price, while the quality of reading-matter, scientific and miscellaneous, will be more than maintained. Each of the several important departments will be retained, and no expense spared to make THE JOURNAL the best and most useful publication for general circulation.

THE JOURNAL for 1878 will contain a series of carefully-prepared articles on THEORETICAL and PRACTICAL PHRENOLOGY, under the title of

"BRAIN AND MIND."

These papers will be amply illustrated, and furnish the subscriber and reader with a clear exposition of the science in its various departments.

It is also purposed to publish a series of articles, by a writer of experience, on the Training of the Young. These articles will be entitled

"MY HOME KINDERGARTEN."

Besides, the Portrait and Biographical Sketch Department will be fully supplied, and each number will contain useful suggestions on home and sanitary matters.

Terms.—Published monthly at $2 a year, single numbers 20 cents. Clubs of ten at $1.50 each, and an extra copy to agent. A new volume begins with the January number, and the last three months of this year will be sent FREE to new subscribers whose subscriptions are received for 1878 before January 1st.

AGENTS WANTED. Liberal Cash Commissions given, or choice from liberal Premiums; and at these reduced rates large lists of names should be obtained by every canvasser. Send for Terms.

Address S. R. WELLS & CO., Publishers, 737 Broadway, New York.

Publishers' Department.

The business affairs pertaining to the publication and circulation of this Journal, and other miscellaneous and current matter, with advertisements, in general, are inserted in this department.

ANNOUNCEMENT.

In the August number the subscriber may expect to find sketches of Henry Clay, the Sultan of Turkey, the Czar of Russia, with some account of the generals commanding the Russian and Turkish armies, and a sketch of the Ohio Wesleyan University, with portrait of President Payne. A new story illustrative of Life and Character, by the editor, will be commenced, and, if ready in time, "Glimpses of Life in the Sea," with illustrations.

Opinions of Correspondents.—A few extracts from letters recently received indicate somewhat forcibly the sentiment entertained with regard to the PHRENOLOGICAL by the great majority of its readers.

"I have been taking the JOURNAL for three years, and the more I read, the better I am pleased, and the more convincing are the teachings and principles of Phrenology."—(J. W. B.), *Jewitt, Texas.*

"Let me give my testimony to the truthfulness of Phrenology as I apply it to the half-civilized, untutored people among whom I live. They can not conceal their true inclinations, nor do they try to do so, but act out their real character, and it corresponds with their phrenological indications *every time.*

"I have noticed the most prominent phases of their character in their superstition, next in their caution, next secretiveness. You could give a good contour of their head if you had never seen one."—(A. J. H.), *Bap. Mis.*

"Indeed, I would prefer it to any religious paper I have ever read, and I pity the person that can read it and not strive to be a better man or woman.

"My scribbling may not interest you enough to pay you for reading it, but it comes from a heart that loves the work in which you are engaged, and whose best wishes are for your success."—(W. M. C.), *Winterwood, Ind.*

"I have been a reader of your PHRENOLOGICAL JOURNAL for more than three years, and have learned to love and respect the principles therein as coming from the hearts of those whose great interest is for the improvement of the present and rising generations. I can not express in *words* how much your periodicals have done me, but I trust it may find expression in my influence with others.

"My husband, too, has been a constant and devoted reader of your publications for nearly nine years, and I feel that to *them* more than to any other cause he owes the right development of his truly noble character."—(A. G.), *Spencerport, N. Y.*

"I will be one among your many readers to add one new name to your list. Since I've been interested in your JOURNAL I can no more do without it than to eat and drink, for it is meat unto my soul and intellect."—(W. R. F.), *Emerson, Iowa.*

"I had for some time desired a periodical entirely free from the silly sentimentalism of the day. I at last came across the JOURNAL, which seemed like the return of an old friend; for 20 years ago and over I was a regular subscriber for some time, and was well pleased with it. I find it has grown in almost everything that feasts, instructs, and improves the mind and heart."—(C. G.), *Battle Creek, Mich.*

"We subscribed for the PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH at the commencement of the present year, and we like it *very* much. We greatly admire its brave, fearless tone and high moral standard, and think it destined to accomplish a vast amount of good in rooting out old prejudices and errors, and in letting the light of truth into thousands of minds long darkened by superstition. I think the JOURNAL ought to be read in every household in the United States, and I wish it God-speed on its noble mission."—E. L. SHERMAN, *N. Y.*

"Your ever-welcome JOURNAL is at hand for June, and as I read it carefully it is a matter of wonderment to me how people can do without it. I would almost as soon think of living without talking (and that is saying a good deal for an editor) as to attempt to live without the JOURNAL. I find it replete with good things, and overflowing with wisdom. My opinion is, if more people would take and read it we would not meet so many daily who are at a loss to define their positions. Long may the JOURNAL live, and may its editors continue in the good work until the reading world shall be posted upon the great science of Phrenology."—(J. F. E.)

Reduction of Cost.—The Board of Trustees of the American Institute of Phrenology have resolved to reduce the price of tuition for the summer and autumn sessions of the present year, to seventy-five dollars, in consequence of the hard times. It is hoped that all who intend to come as students, and all others who hope for the diffusion of a knowledge of human science, will use influence to induce the right type of students to attend.

To Our Local Agents —Now is the time for our *local agent friends* and others to canvass for the JOURNAL. A new volume commences with this number, so this is a good time to subscribe; besides this we are now offering splendid BOOK PREMIUMS to subscribers, new and old, and these premiums do not in any way affect the premium offered to the agent. The combination of premiums, those given to the subscribers and those to the agents make our premium offers without precedent in liberality. For instance, for three subscribers to the JOURNAL, New Physiognomy, worth $5, is given as a premium; besides this $4.50 worth of books are given to the subscribers, making $9.50 worth of books and $9 worth of JOURNALS for $9, and the postage extra, which, if the books are all sent by mail, amounts to $1., and so on with other premium offers. While this offer is in force will not the friends of the JOURNAL take advantage of it, and help themselves as well as help the cause along? Now is the time to try it.

Woman's Health.—We are very glad to note the success that Mrs. Dr. Abbie E. Cutter is meeting with in her physiological lectures. She has been for some time in Louisville, and from a report in the *Courier Journal* we judge she is stirring matters up considerably. She has replied very forcibly in the papers and in a public lecture to the restrictions on lady physicians made by Dr. R. W. Gaines, late president of the Kentucky State Medical Society. She uses electricity as a specialty in connection with hygiene, and is building up a successful practice. She has recently organized a Ladies' Physiological Society. The following taken from the constitution will show something of the scope and objects of the society:

"Article 1. This society shall be called the Ladies' Physiological Association, of Louisville and vicinity. Its object is to promote among women a knowledge of the human system, of the laws of life, health and development, and of the best means of preventing and relieving sickness and suffering.

"Art. 2. The society shall provide instruction upon all subjects belonging to the science of man, especially hygiene, physiology, psychology and anatomy, in their practical bearings upon the prevention and cure of disease, the training of children and youth, and the general improvement of the human race. But no subjects shall be introduced for consideration by the society which have not a direct bearing upon social and personal improvement and happiness.

"Art. 3. The society shall procure a collection of apparatus, illustrations, engravings, etc., as a physiological museum, to which the members of the association shall have access, and a suitable library for the use of its members."

The names of one hundred ladies were immediately subscribed, and others have since joined. This society and Dr. Cutter have our best wishes so far as they are working in the direction of hygiene and health reform.

Our Croquet Premium.—This is the season of croquet-playing, and now is the time to procure a set for nothing. We make extraordinary offers in this direction. For two subscribers at $3. each we give a $6. set of croquet, and to each subscriber a book premium by remitting the extra 25 cents each as a postage. For five subscribers and $15. we give a $17. set of BRADLEY'S PATENT CROQUET, with all the improvements and extra finish, and book premium to subscribers. There need be no excuse for not having a good set of croquet. Boys and girls should work for this premium.

The Summer Class OF THE AMERICAN INSTITUTE OF PHRENOLOGY, will be opened on the sixth of July, and continue as usual, six weeks. Here the teacher may forget the drudgery of the dry studies which wear his brain and weary his body; the overworked minister may, for a brief time, stop giving off nerve force constantly in the way of instructing others; the student may lay aside his lessons in mathematics, grammar, geography, chemistry, and the Greek and Latin classics, and become the happy recipient of a knowledge of himself, may learn how the human mind can become the source of happiness and of power.

The most of human life is occupied in efforts that work outwardly, that act on the world of matter, but which do not build up the real individual. A man may become the factor of profit to the community, and so may a steam-engine, or the rushing stream which idly flows through a town. Thousands wear themselves out in mere physical work, or efforts for financial prosperity, and obtain little or no knowledge of their higher or inner life. He who learns the great laws of his own mental and moral powers, and cultivates that which makes him more than an animal is the one who lives a true life, and earns a place in the memory and reverence of the race.

The use and culture of mind and soul is as much superior to mere secular business and financial success, as mind surpasses in value mere matter. Who asks, or cares to ask, if Shakspeare, Milton, or Burns were rich; Who thinks or cares to inquire if Tennyson, Longfellow or Bryant possess worldly wealth? They are prized, and will be remembered with honor when a hundred subsequent generations of rich, business men will have been forgotten. All who teach, preach, write or wield influence over mankind by guiding and controlling their mind and character, will find the study of Phrenology the greatest possible aid to the accomplishment of their life-work.

Human science stands first in the realm of thought and study. This knowledge attained, all else becomes doubly easy and delightful. By obtaining it the business man doubles his power, because to do business easily and successfully he must know the minds and characters of those whom he would influence. All should obtain this knowledge, and the best facilities for doing so are afforded by the instructions which are given in the American Institute of Phrenology. For information on the subject please send for circular to S. R. WELLS & CO., 737 BROADWAY, N. Y.

Our Premium Books.—As announced in our June number we have decided to offer BOOK PREMIUMS to those who renew promptly or subscribe at once for the coming year, sending with the subscription price 25 cents extra for the payment of postage on book and JOURNAL. This offer is especially made for renewals, to prompt those whose subscription expired with the June number to send in their renewals at once, but is extended to all, whether new or old, and those whose subscriptions have not yet expired may take advantage of the offer by subscribing now for another year in advance. The list of books offered will be found on another page, and includes our most useful and popular works. Send on your names at once with the amount, naming the books desired. Should others, or higher price books be desired, they may be procured by sending the difference in price, but must be selected from our own publications.

How to Raise Fruits.—This work is now having a large sale and especially by book agents, tree agents, and nursery-men. It is *the* book on this subject, and should be owned by all who are in any way interested in growing orchard fruits, small fruits, grapes, berries, etc. As an indication of the merits of the work we publish the following from many

NOTICES OF THE PRESS.

"This recent addition to the admirable "How Series," published by the above well-known house, embraces, within its one hundred and eighty pages a careful digest of the experience and wisdom of the best fruit growers."—*Demorest.*

"We feel it incumbent on us to recommend it to the readers of the *Rural*, aspresenting in a condensed form much valuable matter. There are books on fruit culture four times its size with one half its information. While we might take issue with the author on some minor points, as a whole we cheerfully commend it to all who have even one square rod of ground to cultivate."—*Rural New Yorker.*

"This is one of the handsomest books that have come to our table during the year. Any information needed by the ordinary fruit grower on the subject, we think, can be found in this convenient little book. It gives excellent hints on the subject of varieties, and will be just in season now."—*Methodist Recorder.*

"Its pages are crowded with valuable information, and copiously illustrated."—*Western Farmer.*

"Without pretension to elaborate fulness, this well-printed book meets the requirements of a manual for the use of the young or amateur fruit raiser, and is not wanting in many suggestions which the experienced pomologists would find profitable."—*Inter-Ocean.*

"This little book is a thoroughly excellent and practical treatise; and it has our special commendation, not only on account of its valuable instruction to fruit growers, but for its convincing demonstration of the value of fruit to the farmer as a source of revenue, and to the consumer as an article of diet."—*Scientific Amer.*

"This is a very useful work, and should be in the hands of every one interested in fruit culture. It treats the subject very fully, and gives instructions in raising all kinds of fruits. Farmers often grope blindly along, grumbling at their want of success, when the investment of a small sum for a work like the above would shed light on the dark places, and turn the tide of success in their favor."—*The Housekeeper's Companion.*

"The practical part of the book is largely devoted to lists of the best fruit trees, vines, etc., and their planting and after culture. From a pretty careful examination of this part we are pleased to say that it is very well done, and that that class for whom it is intended, those with moderate means, may consult it with profit."—*Herald of Health.*

"With condensed descriptions of many of the best and most popular varieties. Is fully illustrated, conveniently arranged, and well worth the price.—*Ind. Farmer.*

"We know of no book of its class which is likely to prove more satisfactory."—*Christian at Work.*

"A manual for the use of the amateur fruit raiser, with suggestions which the experienced pomologist may find profitable."—*Rod and Gun.*

"Its price considered, we know not the volume which contains a greater amount of useful information on fruits and their culture, and which is more tastefully gotten up."—*Western Christian Advocate.*

"The author is a practical cultivator, and writes with interest and zeal, and these qualities go far toward making a valuable book."—*The Cultivator and Country Gentleman.*

"The design has been carried out with good judgment, care, and consequent success."—*The Phila. Inquirer.*

"This hand-book, besides being useful to those who take a special or professional interest in fruit culture, is full of the most varied information, which will interest even the most casual reader."—*Telegram.*

"The volume is illustrated, and its style is clear, the absence of scientific fog, in the nature of technical terms, adding much to the value of the book."—*Prairie Farmer.*

"This hand-book is practical and plain."—*Forney's Press.*

"A contribution an amateur horticulturist should especially welcome."—*Evening Traveler, Boston.*

A Necessary Article.—No one should drink impure water. Even that which we get from the clouds needs purification for drinking purposes. But in great cities where the supply for the household is obtained from an aqueduct the water is not always of a quality good enough for the purposes of the toilet and laundry; so that for food use its purification is indispensable. If one can not get a regular filtering cask he can get the next best thing, a good strainer, of which there are several patterns. A very convenient and desirable device is that made by the Globe Filter Company, of No. 9 Murray St., New York. It is of spherical form, lined with tin and filled with silica and charcoal, thus combining something of the property of the filter to the strainer. It can be attached to the faucet of the water pipe or cooler, and is reversible so as to be readily cleaned.

Rocking Chairs.—In the present number of the JOURNAL will be found an advertisement of Sinclair's common sense chairs and rockers. These are a most excellent and, indeed, a "common sense" chair. They are well made, exceedingly strong, using the splint bottom and backs, and are made so as to fit the body. They will be found very durable, and are cleanly, not gathering dust as is the case with most easy chairs. From one to a half dozen, at least, of these should be found in every well-regulated household. Send your address with stamp to F. A. Sinclair, Mottville, N. Y. for circular, saying the notice was seen in the PHRENOLOGICAL JOURNAL.

Silver-ware Premiums.—Among our most popular premiums are silver-plated table-ware, something that is always needed, and is still by many considered a luxury, but when obtained on the liberal premium plan set forth in our premium list considered a necessity.

One Cent a Day.—Less than one cent for each working day in the year will secure the PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH regularly, and who is there who cannot afford this amount? By sending now you can secure a BOOK PREMIUM itself worth half the cost of a year's subscription.

Personal.

General Grant has gone to Europe. He is the first ex-President to cross the ocean since the days of Frank Pierce. Of the nineteen presidents, Washington, Madison, Jackson, Harrison, Tyler, Polk, Taylor, Lincoln and Johnson, never crossed the ocean. Those who visited foreign lands were John Adams, Jefferson, Monroe, Quincy Adams, Van Buren, Fillmore, Pierce and Buchanan. It is said that the ex-president on his arrival in London was received with general acclamation, given a special audience with Queen Victoria, and made the guest of Mr. Disraeli, the Prince of Wales, and of other members of royalty and nobility.

Pere Hyacinthe has recently been delivering lectures on "Reform in the Family," at the Cirque, Paris, but it is said that the eloquent orator, who once held his congregation spell-bound, can now scarcely command attention, on account of his change of religious opinion. Another paper says that his Sunday audience numbers 4,000.

It is becoming to mention that the Institute has been presented with a fine bust of Pere Hyacinthe, by Mrs. John Hecker, which was moulded from nature expressly for Mr. Hecker.

Paul Morphy, the famous chess-player, the papers have repeatedly told us, is an inmate of an insane asylum. A New-Orleans paper now says that, instead of being confined, he can be seen any afternoon on Canal Street, in that city, attending to his own business, and apparently willing that other people should do as much for themselves.

Fletcher Harper, the last of the "Brothers" who built up the great publishing house in Pearl Street, died on the 29th of May, in his seventy-second year. He was a man of remarkable business energy, but quiet in his methods.

Dr. Stephen H. Tyng, Sen., who was for some time extremely ill of typhus fever, complicated with erysipelas, is now, we are glad to say, well on toward recovery.

Barnum has advertised for Charley Ross; offers $10,000 for him. Probably the great showman would find him, if anybody could.

Business.

Notice.—The Phrenological and Publishing Business heretofore conducted by the late S. R. Wells (formerly Fowler & Wells), will be continued by his widow, Mrs. Charlotte Fowler Wells, under the firm name of S. R. Wells & Co. Correspondents, Agents, and others, when communicating on business matters connected with this office, should address their letters to

S. R. Wells & Co., 737 Broadway, N. Y.

Hygienists and others visiting New York can obtain excellent board and rooms at Dr. R. T. Trall's Hygienic Institute, at 102 East 22d Street. Electric, Hot-Air and Vapor Baths can also be obtained if desired. This Institute is the only one under Dr. Trall's personal supervision, and he can be here consulted at all times. Send for circulars.

To Our English Readers.—We desire to announce to our readers and friends in the British Provinces, that we will accept as payment for our publications English or other foreign postage stamps, at the rate of 4s. 6d. for a dollar's worth, and send our books by mail, post-paid, at prices given in our announcements and lists. This will, without doubt, be a great accommodation to many, as our books are not always to be found in the local book-stores. If a book advertised at $1.50 is desired, send us, in postage stamps, and for other books at proportionate rates, and they will be sent by return mail.

Saratoga Springs. Drs. Strong's Remedial Institute has Turkish, Russian, Sulphur, Hydropathic and Electrical Baths, Vacuum Treatment, Inhalation of Oxygen, Compressed and Rarefied Air Health-lift, etc., for the treatment of Nervous, Lung, Female, and other Chronic Diseases.

Healds' Hygeian Home,

Wilmington, Delaware.

Terms Reduced! A Boarders' Table added!

Our delightful spring season has come, soon to be followed by our even more pleasant summer. Wilmington is noted for its healthful and beautiful location. We have all the city advantages, with pure country air, fine extended views, pleasant grounds, adjacent groves and charming walks on the beautiful Brandywine.

The noble Delaware, sail-whitened with the commerce of a great metropolis, spreads its bright waters before our view, rapidly broadening into the grand bay, which sweeps majestically on to the not distant ocean.

From these broad expanses of fresh and salt water, come to us ever invigorating, health-giving breezes, making our summer climate especially inviting to invalids.

Our Hygienic table has won an enviable reputation among hygienists. We do not spare expense or personal care to make it what it is acknowledged to be—the best hygienic board spread in any "Cure" in America. ☞ We have also added a separate table, with three meals, and meat, etc. Those who believe, *with us*, in two meals per day, and a splendid grain, fruit, and vegetable dietary, will *still find* the same attractions as in the past. Our abundant supply of canned fruit is all in glass.

We have one of the finest fruit and vegetable markets in the world. From strawberries in May, we have an uninterrupted supply of fruits, etc.:—cherries, raspberries, currants, gooseberries, blackberries, whortleberries, peaches, apples, pears, melons, plums, grapes, etc.

We have a model garden, which produced last year 500 quarts of strawberries—15 varieties; 300 quarts of raspberries; 300 lbs. of grapes, with other choice fruits, together with an abundance of the best peas, sweet corn, beans, tomatoes, and other healthful vegetables—*all fresh*.

Our house is warmed *throughout* by indirect steam radiation; each room is *thoroughly ventilated* from its base into a warm flue—insuring outward draft and *warm floors*—giving a *pure atmosphere*, free from smoke, gas, or dust. *No charge for heat or gaslight!*

Our Bath-Rooms (up in the sunshine) have first-class appliances: are well-warmed—ventilated—have pure soft water, hot and cold, in abundance. ☞ **Steam and Hot-Air Baths.**

Swedish Movements thoroughly and judiciously administered. Health-Lift; Sun Baths; social pleasures; instruction. *Come and get well!* We will aid you, and try to add to your happiness and comfort while with us.

The proprietors have had, respectively, 15 and 17 years experience as hygienic physicians, and have successfully treated thousands of invalids from 35 States and Territories, from Canada, Nova Scotia, West Indies, England, Scotland, Ireland, Wales, Germany, and Australia. Our building is new and was erected by us for our work of healing the sick.

Those desiring the advantages of a healthful diet and a pleasant home in the suburbs of an attractive city, can have the same as boarders, without treatment; *free use of Bath-Room*.

Young men who have lost the buoyance of youth through errors, will find in Dr. P. HEALD a counselor and friend who can and will gladly aid them to a new life, new hopes, and restored health.

Dr. MARY H. HEALD will devote especial attention to lady patients, giving them the benefit of kindly sympathy, as well as of experience and skill. We give *our personal attention to all the departments* of the Home. For Circulars, etc., address, with stamp, PUSEY HEALD, M.D., or MARY H. HEALD, M.D.

THE ORIGINAL MOUNTAIN HOME.

A. SMITH, M.D., Owner and Proprietor,

Has refitted and refurnished, anew, the "Mountain Home," from top to bottom. Address for circular either

"Mountain Home," Wernersville, Berks County, Pa.

Hygienic Hotel,

13 & 15 Laight Street,

NEW YORK.

This well-known House is convenient of access from all parts of the city, six lines of horse-cars passing near.

The table is supplied with an abundance of the best kinds of food, *healthfully prepared*; special attention being paid to the preparation of breads, fruits, farinaceous foods, vegetables, etc.

In connection with the Hotel are Turkish Baths, Swedish-Movement Cure, Electro-Magnetic Baths, Health-Lift, etc. Circulars free. Terms reasonable.

WOOD & HOLBROOK, Proprietors.

THE

Rest Cure,

known far and wide as Our Home Hygienic Institute, Dansville, Livingston County, New York, is the largest Institution of its kind in the world, and is unequalled in America as a place for curable invalids of BOTH SEXES—no matter what their diseases—to recover good health. For over taxed thinkers—as editors, preachers, lawyers, judges, public officials, teachers, artists, merchants, and business men of all callings and pursuits, who are weary from work, it is unsurpassed for its facilities for rest and recuperation. The best of references given and full information rendered on application FREE of cost. Address as above.

JAMES C. JACKSON.

OUTLINES

Of a Common-sense System, 48 pages, sent free to all applicants. A most important work on the Hygienic Treatment of Invalids. Send and get it. "Difficult to find so much real logical argument in so small a space" says an eminent professor. Address

ROBERT WALTER, M.D.,

Wernersville, Berks Co., Pa.

A GOLD MEDAL was awarded to Dr. JEROME KIDDER at the Fair of the American Institute, in the fall of 1875, for the best Electro-Magnetic Apparatus either here or abroad; and in the fall of 1876 the Diploma of Maintained Superiority was awarded. Also the very highest award was accorded to him for his Apparatus at the Centennial Exhibition at Philadelphia.

Fac-simile of Dr. Kidder's Trade Mark, which accompanies the genuine Electro-Medical Apparatus.

Trade Mark.

CAUTION.—Practitioners should be on their guard in reference to certain fictitious machines where a coil is tapped, and at different points connected with separate metallic parts, and falsely claimed to be like Dr. KIDDER'S manifold coil apparatus. To know the genuine apparatus from the spurious, address, for Illustrated Catalogue,

Dr. Jerome Kidder,

THE

Hygienic Home Cook-Book;

Or, Healthful and Palatable Food without Condiments. A Complete Book of Recipes or Directions for Preparing and Cooking all kinds of Healthful Food in a Healthful Manner. By R. T. TRALL, M.D. Price, in Paper, 25 cents. Nicely bound, 50 cents.

CHAPTER I.—**On Breads,** giving General Rules and Directions for making the premium bread, hot and cold-water loaf; also, cocoanut, fruit, sweet potato, white potato, pumpkin, apple, snow, currant, Graham, farina, rye, Indian, rye and oatmeal, and brown BREADS, Water and mush ROLLS, GEMS, plain, and with fruit, wheat-meal and oat-meal CRISPS, Johnny-cake, pumpkin Johnny-cake, berry short-cake, corn-dodgers, rice cakes, berry, apple, and rhubarb TOAST, and the use of whole grains and seeds.

CHAP. II.—**Mushes.**—General Rules and Special Directions for making crushed wheat, oat-meal, Graham, rye, berry, and rice MUSHES, corn grits.

CHAP. III.—**Pies.**—General Rules and Special Directions for making Graham, oat-meal, corn-meal, cocoanut, and potato PIE CRUST; and apple, berry, rhubarb, pumpkin, peach, pear, dried fruit, cocoa, custard PIES, TARTS, DUMPLINGS, etc.

CHAP. IV.—**Puddings.**—General Rules and Directions for Hygienic BROWN BETTY, apple, snow-ball, and steamed PUDDINGS.

CHAP. V.—**Sauces.**—General Rules and Directions for making cocoanut, date, lemon, orange, currant, apple, tomato, grape and apple short-cake SAUCES.

CHAP. VI.—**Soups.**—General Rules and Special Directions for vegetable, tomato, bean, pea, spinach, vegetable, rice, potato, and asparagus SOUPS, vegetable and barley BROTHS, PORRIDGES, GRUELS, etc.

CHAP. VII.—**Vegetables.**—General Rules: Model cooked POTATOES—boiled, mashed, browned, baked, roasted, steamed and mashed SWEET POTATOES, boiled and browned TURNIPS, boiled beets, chopped BEETS and TOMATOES, PARSNIPS, CARROTS, boiled CABBAGE, cabbage and tomatoes, CAULIFLOWER, ASPARAGUS, greens peas, beans, green corn, succotash, boiled and baked dried BEANS, beans and cabbage, split peas, dried green peas, CUCUMBERS, etc.

CHAP. VIII.—**Fruits.**—General Rules and Special Directions for preparing baked APPLES, baked apples with dates, baked pared apples, steamed and stewed dried apples, pears, peaches, apricots, quinces, pineapples, cranberries, blackberries, raspberries, strawberries, cherries, plums, gooseberries, bananas, oranges, lemons, tomatoes, melons, rhubarb, pumpkins, squash, grapes, prunes, English dried currants, etc.

CHAP. IX.—**Preserving Fruits.**—General Rules for preserving berries, grapes, packing GRAPES, apples, pears, tomatoes, bananas, rhubarb, VEGETABLES.

From the above, it will be seen that this little Cook-Book treats of everything that could possibly be needed by one who wishes to cook and eat and live for health. It will be observed that brandy peaches, and sauces, mince pies and fried cakes, with some few other dishes that come in this class, are omitted, but not to the detriment of the book. Every housewife, whether strictly Hygienic or not, should have a copy of this COOK-BOOK, and it will tend to make more Healthful HYGEIAN HOMES. Only 25 cents in paper; or, 50 cents in cloth, by mail.

For Families and Physicians.

A Bathing Cot or Fever Bed

DESCRIPTION.—The Bed on which the patient lies, consists of a strong, elastic, cotton netting, and through which water readily passes to the bottom below, which is of rubber, and so adjusted as to convey it to a vessel at the foot. The Cot is so constructed it can readily be taken apart when not in use, and occupies but little space.

ITS USE.—It is now understood that all infectious and malarial diseases are the result of seed germs or poisons insensibly taken into the system through the lungs, and that a higher than the normal temperature of the body, 98°, is required to cause their development. So long as the temperature, therefore, is kept at the normal point, the vital system will expel these germs; but when the heat rises much above this standard, the germs develop, act as a ferment, and rapidly increase.

As water is almost universally used in regulating the temperature of the body, it is important that a method of application be adapted which will enable us to accomplish the desired result the most readily. For this purpose the BATHING COT is unsurpassed; in fact, the only appliance which will admit of the use of water in such a way as to speedily accomplish the desired results, as it admits of the pouring or dripping process, by far the best method of changing the temperature of the body. It is also used in nearly all the bathing processes, including the Wet Sheet Packs, Sponge Baths, Wet Dress Baths, Air Baths, Rubbing Baths, Fomentations, etc.; treatment of any kind in surgical operations, and as a means of bathing children or those who require assistance in ordinary bathing, it is admirable. The Cot can be used in any room without soiling carpets or floor, and at the bedside of the patient, and being used instead of an ordinary bed, it leaves this dry and clean. As it is on rollers, it can be moved to any part of the room, or be a means of moving the patient from one room to another. It is admirably adapted for use as a bed, and as a summer bed without a mattress, it can not be surpassed. Send stamp for circular with full directions for using.

PRICE, - - - - $10.00.

We are prepared to supply the following adjuncts to the Water Treatment:

THERMOMETERS.

8 inch, marking to 120°, 50 cents.
12 " " " 220°, 75 cents

FEVER THERMOMETERS.

Otto's Reservoir Thermometers. 5 inch, graduated in fifths, rubber case, $4.75.
This instrument is fully warranted, and has points of excellence possessed by no other.

RUBBER BAGS.

1 Gal., $2; 3 Qts., $1.75; 2 Qts., $1.50; 1 Qt., $ .25.

On Wedlock.

WITH PORTRAIT OF AUTHOR.

WEDLOCK; OR, THE RIGHT RELATIONS OF THE SEXES. A Scientific Treatise disclosing the Laws of Conjugal Selection, Pre-natal Influences, and showing Who Ought and Who Ought Not to Marry. By S. R. WELLS, author of "New Physiognomy," "How to Read Character," editor of the "Phrenological Journal," etc. Plain, price $1.50; in fancy gilt, $2.

Among the subjects treated are the following: Qualifications for Matrimony; The Right Age to Marry; Motives for Marrying; Marriages of Consanguinity—of Cousins—when Justifiable; Conjugal Selection—Affinities; Courtship—Long or Short; Duty of Parents; Marriage Customs and Ceremonies of all Nations; Ethics of Marriage; Second Marriages—are they Admissible; Jealousy—Its Causes and Cure; Grounds for Separation and Divorce; Celibacy—Ancient and Modern; Polygamy and Pantagamy; Love Signs in the Features, and How to Read Them by Physiognomy; Sensible Love Letters—Illustrious Examples; The Poet's Wife; THE MODEL HUSBAND AND THE MODEL WIFE—their Mutual Obligations, Privileges, and Duties; What Constitutes a True Marriage; The Poetry of Love, Courtship, and Marriage—The Work being a Practical Guide to all the Relations of A HAPPY WEDLOCK.

Here are a few of the subjects contained in this most useful work, compiled from the Contents.

Development and Renewal of the Social Affections; Inordinate Affection; Function of Adhesiveness and Amativeness; Admiration not Love; Addresses Declined—How to Do it; Matrimonial Bargains; True Beauty; Celibacy and Health; Celibacy and Crime; Marrying for Money; Facts in Relation to Consanguineous Marriage—when Permissible; Law of Conjugal Selection; Conjugal Harmony; Conjugal Resemblances of Husbands and Wives; Pleasure of Courtship; Confidence in Love; Duty of Cheerfulness; Woman's Constancy; Laws and Remedy for Divorce; Drifting; Economy; Etiquette of Long Engagements; Falling in Love; Forbearance; Whom Great Men Marry; Girls of the Period; Housekeeping; Good Habits Essential; How to Win Love; Honeymoon; The Model Husband; Home—How to Make it Happy; Mutual Help; Conjugal Harmony; Hotel and Club Life; Inhabitiveness; Terrible Effects of Morbid Jealousy; Juliet's Confession; Kisses; Kate's Proposal; Parental Love—How to Win It; Declarations of Love; Not to be Ashamed of It; Romantic Love; Second Love; Is Love Unchangable? Should Parents Interfere? Love Letters; Love Song; Congratulatory Letter: Little Things; Love's Seasons; Its Philosophy; Early Marriage among the Ancients—Motives for It; International Marriage; Marriage Customs; Marriage Defined; Its Legal Aspects; Marriage Ceremonies in the Episcopal, the Roman, Jewish, Quaker, and in the Greek Churches; Marriage Exhortation; Ethics of Marriage; Health and Marriage; Hasty Marriages; Marrying Maxims; Morganatic Marriages; Marrying for a Home, for Money, for Love, for Beauty; Right Motive for Marrying; Advice to the Married; Man and Woman Contrasted; Monogamy Defined; Matrimonial Fidelity; Matrimonial Politeness; Legal Rights of Married Women; The Mormon System; Man's Requirements; The Maiden's Choice; Letters of Napoleon; When to Pop the Question; Pantagamy Defined; Meddling Relatives; Physical and Mental Soundness; Stepmothers; The Shakers; Singleness; Something to do; Wedding in Sweden; Temptations of the Unmarried; Hereditary Taints; Temperaments most Compatible; Trifling; May Woman Make Love? Lesson for Wives; Wedding Gifts; Wife and I; How a Lady Said It; Plain Talk with a Young Man; Soliloquy of a Young Lady; "To Marry or Not to Marry—That is the Question."

The book is handsomely printed and beautifully bound. Intended more especially for young people, but may be read with profit by those of every age. A suitable present to a lady, or to a gentleman.

This edition of Wedlock, with Portrait of the Author, is one of the books we offer as a premium to those who subscribe before August first, for the **Phrenological Journal and Science of Health,** sending $3.00, and 25 cents extra as postage on **Journal** and **Premium Book.**

A Manual of Medical Electricity.

Showing the most scientific and rational application to all forms of Acute and Chronic Disease of the different combinations of Electricity, Galvanism, Electro Magnetism, Magneto-Electricity, and Human Magnetism. By WILLIAM WHITE, M. D. Muslin, price $2.00.

The application of electricity as a remedial agent in cases of disease, is a recently developed feature in the progress of medical science, and promises to become one of the most important. This lately published volume of Dr. WHITE gives a Diagnosis of more than fifty diseases, embracing nearly all the classes of disease to which humanity is liable. It also gives full and complete instructions on new and scientific principles for the application of Electricity in remo..ng disease; and is equally adapted to the use of Physicians and Families as well as Students ; and as a companion to the Electro-Magnetic Machine or Galvanic Battery, is indispensable to all who would apply such apparatus intelligently.

It contains all that is of use in the least possible space, and yet so full as to be practical, and no one need be at a loss how to proceed without farther instruction.

The following are a few of the subjects treated, condensed from contents:

Abscesses; Ague in Breast; Alopecia; Amaurosis; Anasarca; Aphonia; Apoplexy; Arthritis; Ascites; Asiatic cholera; Asphyxia; Asthma.

Biliousness; Biliary calculi; Blood; Boils; Bright's disease of the kidneys; Bronchitis; Bruises; Bunions; Burns.

Cancer; Canker in Mouth; Catalepsy; Chronic Catarrh; Cataract; Cephalalgia; Cessation of menses; Change of life; Chester's electropion battery; Chicken Pox; Chilblains; Chlorosis; Cholera Morbus; Cholera Asiatic, and Cholera Infantum; Chorea; Colic; Colds; Conditi..ns of health and disease; Co..gestion; Constipation, or Costiveness; Consumption of lungs; Contusions; Corns; Crick in neck, back, limbs and stomach; Croup; Curative agents; Cystitis.

Deafness; Debility, general and nervous; Deficient secretion of milk; Delirium tremens; Diabetes; Diaphragmitis; Diarrhœa, acute and chronic; Diphtheria; Dropsy of limbs and feet, of abdomen, of chest, of brain; Dysentery; Dyspepsia.

Electrical apparatus, machines, currents, diagnosis and medication; Electro-Magnetic, or Faradaic Machine; Electrodes, for local treatment; Enteritis; Epilepsy; Eruptive fever; Eruptions; Erysipelatous inflammat..on; Erysipelas; Eye, inflammation of, lids thickened or granulated.

Fainting; Falling off of the hair; Falling sickness; Far-sightedness; Felons; Fever and ague; Fever, remittent, intermittent, eruptive, scarlet and puerperal; Fistula lachrymalis and in ano; Frost-bitten limbs; Frozen ears, limbs, etc.

Galvanic battery and bath; Gastritis; Gathered breast; General tonic treatment; Giddiness; Glandular enlargement; Gleet; Glossitis; Gonitis; Gout; Green sickness; Gums, inflammation of.

Hall s electro-medical apparatus: Harmonious growth of the physical, mental, and spiritual, necessary for the health of man; Headache, nervous and sick; Hematuria; Heart, palpitation, enlargement and weakness; Hemiplegia; Hemorrhoids; Hemorrhagia, active and passive; Hepatitis; Hernia; Hip disease; Hydrops; Hydrothorax; Hydrocephalus; Hydrocele; Hypertrophy; Hypochondria, Hysteria, or Hysterics.

Influence of mind over man; Instruments, or electrodes, for local treatment; Inflammation, phlegmonous, acute, chronic and erysipelatous, of bladder, brain, lungs, pleura, stomach, liver, intestines, kidneys, spleen, diaphragm, the eye, the peritoneum, the internal ear, larynx, tonsils, tongue, bronchia, palate, gums and of knee; Intermittent fever; Icterus; Influenza; Intestines, inflammation of.

Jaundice; Kidder's apparatus.

Lungs, inflammation, hepatization, consumption and weakness; Liver, inflammation, enlarged, torpid and hardened; Laryngitis; Limbs, dropsical, frozen and cramp; Loss of voice.

Medication; Magneto-electric apparatus; Myopia; Measles; Mental derangements; Mania-a-potu; Mouth, sore, nursing sore, cankered; Menorrhagia; Miscarriage; Mumps; Milk, deficient secretion and suppression; Milk leg.

Nephritis; Near-sightedness; Neuralgia; Nervous headache; Nervous debility; Noises in the head; Nursing sore mouth; Nodes; New-born infants; Ophthalmia; Otitis; Oreana.

Primal condition of matter; Philosophy of treating disease; Phlegmonous inflammation; Phrenitis; Pneumonia; Presbyopia; Peritonitis; Parotitis; Puerperal fever; Phthisis pulmonalis; Paralysis; Palsy; Palpitatio cordis; Palpitation of the heart; Piles; Prolapsus ani, uteri; Polypus; Pregnancy; Parturition; Phlegmasia dolens.

Quinsy; Remarks upon electrical currents; Rheumatism, inflammatory and chronic; Remittent fever; Retention of urine; Rupture; Rickets; Ringing in ears; Recent wounds.

Stomach, inflammation, cramp and weakness; Splenitis; Stye; Strabismus; Squinting; Scarlet-fever; Smallpox; Sores and ulcers; Scalds; Spermatocele; Swellings; Scrofula; St. Vitus' dance; Syncope; St. Anthony's fire; Spinal curvature; Suspended animation; Sore mouth; Sore nipples; Sick headache; Sleeplessness; Stammering; Sunstroke; Stone in the bladder; Salt rheum.

Tonsilitis; Trachitis; Tumors; Tetanus; Toothache; Ulcer of the nose; Vertigo; Voiding blood by urine; Vomiting; Varicose veins; Wounds, Weakness of stomach, lungs and heart; Water-brash.

Full directions for the treatment of the above and many other diseases with a great deal of general information connected with the subject is given.

A Valuable Book for Mothers.

THE MOTHER'S GUIDE

FOR

THE CARE OF HER CHILDREN;

OR,

THE MANAGEMENT OF INFANCY.

FOR THE USE OF PARENTS.

By ANDREW COMBE, M.D.

REVISED AND EDITED BY

SIR JAMES CLARK, BART., K.C.B., M.D., F.R.S.,

Physician in Ordinary to Queen Victoria.

Every mother who has had children to rear has felt the need of some comprehensive and reliable book of simple and easy instructions, which shall serve as a guide to her in the hours of sickness and danger which come to her little ones. Many a mother, looking back over her experience, will remember moments of bitter sorrow and doubt, in which she would have given her life for a gleam of knowledge as to the proper thing to do for her sick child, and many a mother, alas! looks upon little graves that might never have been filled had she but known better how to manage her child. How often do we hear the passionate cry—"If I had but known what to do, or what to avoid, my darling would have lived." Nor is this want of knowledge felt by mothers alone—the father is oftentimes less prepared to attend to the child than the mother, and it may be safely said that nine out of ten have bitter cause to regret their deficiency.

It is the experience of every physician that there is a lamentable amount of ignorance among parents as to the proper way of managing young children, and all who have seen this book have hailed it as the best guide that has yet been been issued for parents, and have cordially endorsed it and recommended its circulation

THE

EMPHATIC DIAGLOTT,

OR,

NEW TESTAMENT,

IN GREEK AND ENGLISH,

Containing the Original Greek Text

of the NEW TESTAMENT, with an interlineary word-for-word English Translation; a New Emphatic Version based on the Interlineary Translation, on the Readings of Eminent Critics, and on the various Readings of the Vatican Manuscript (1209 in the Vatican Library); together with Illustrative and Explanatory Foot-Notes, and a copious selection of references; to the whole of which is added a valuable Alphabetical Index. By Benjamin Wilson. One vol. 12mo, pp. 884. Price, $4.00; extra fine binding $5.00.

The different renderings of various passages in the New Testament are the foundations on which most of the sects of Christians have been built up; with this work, each reader may judge for himself whether the words there literally translated are so arranged in the common version as to express the exact meaning of the New Testament writers. It will be found a great aid to the proper understanding of many portions of the New Testament. To clergymen who have a slight but not thorough knowledge of the Greek, to those who have none, and to all Sunday-school teachers it will be found almost indispensable when once used. For sale by all booksellers, and sent by mail, post-paid, by

A NEW BOOK FOR PARENTS AND TEACHERS.

HOW TO TEACH

ACCORDING TO

TEMPERAMENT AND MENTAL DEVELOPMENT;

OR,

PHRENOLOGY

IN THE

SCHOOL-ROOM AND THE FAMILY.

WITH MANY ILLUSTRATIONS.

By NELSON SIZER, *Author of "Choice of Pursuits;" "Domestic Life;" Associate Editor of the Phrenological Journal, etc.* Extra cloth, $1.50.

S. R. WELLS & CO., PUBLISHERS, 737 BROADWAY, NEW YORK.

One of the greatest difficulties in the training of Children which Parents and Teachers have to overcome is not understanding their Temperament and Disposition. This work will aid in this direction more than has ever been done in any other way. It points out clearly the constitutional differences, and how to make the most of each. The following from the contents will show something of the nature and scope of this work.

CONTENTS.

How to Teach; Temperament, its Relation to Health and Culture—Motive Temperament, Vital Temperament, Mental Temperament, Harmony of Temperament; Laws of Health Applied to Education; Intellect Threefold; Individuality; Education Complicated; Disposition to be Educated; Combativeness and Destructiveness; Form; The Law of Magnitude—Size; Locality; Eventuality—The Historical Faculty; Language, Its History and Culture; Color, and Its Uses; Order; Calculation; Time; Tune; Comparison; Causality the Basis of the Reasoning Power; Human Nature, or Intuition of Character; Agreeableness, Suavity; Vitativeness—Love of Life; Alimentiveness—Appetite, its Uses and Abuses; Acquisitiveness; Secretiveness, Policy; Cautiousness, its Uses and How to Train it; Approbativeness, its Uses and Proper Culture; Self-Esteem; Firmness, Obstinacy; Continuity; The Social Nature; Love of Children and Pets; Friendship, Fraternal Love; Inhabitiveness; Constructiveness, Mechanism; Ideality, Love of Beauty; Sublimity; Imitation; Mirthfulness, Wit, Humor; Conscientiousness, Duty, Justice; Hope, Anticipation; Spirituality—Sense of the Invisible and Immortal; Benevolence, Sympathy; Veneration, Devotion; Self-Culture; Principles of Phrenology and location of the organs; Definition of the Mental Faculties.

NOTICES OF THE PRESS.

"The well-known name of the author of this volume would lead the reader to anticipate an educational treatise on the principles of Phrenology. It abounds in valuable suggestions and counsels derived from many years experience, which can not fail to be of service to all who are engaged in the business of education. The subject is treated in a plain, familiar manner, abounding in examples drawn from every-day life, and adapted to reading in the family as well as in the study of the teacher."—*New York Tribune.*

"The plan and purpose of this work is to aid parents and teachers to understand the natural talents, dispositions, and temperaments of those under their guidance. The author shows how those different temperaments should be trained by different methods. This opens a new field to the consideration of the teacher, and will prove of great advantage to those who aim to secure the best results in their work. The text is attractive in style, and the illustrations, drawn from an experience of thirty years, make the work a valuable contribution to the educational literature of the times. It should find its way into the library of every parent and teacher."—*New England Journal of Education.*

"The writer of this volume shows how, on the Phrenological theory, children differ in educational susceptibility, and why, and prescribes methods for the training of different classes of minds."—*Church Journal.*

"This is an entirely new feature in a book intended for the use of teachers, and must prove of great advantage to them. The text is written in a manner which must attract every reader, and its numerous and apt illustrations assist the text greatly in pressing home the points advanced in such a manner as to be intelligible to every class of readers."—*The Methodist.*

"There is a great deal of good sense in the work, and believers in Phrenology will be glad to welcome the treatise. So should all conscientious teachers, whether familiar with the science or not."—*The Commonwealth*, Boston.

"Teachers will commit a great blunder if they allow the sub-title of 'How to Teach; or, Phrenology in the School-room and the Family,' to influence them against the book. . . . . The lack of similar guidance in the school-room is the cause of incalculable hindrance. Mr. Sizer writes not as a theorist, but as a man who has made the human mind a subject of special study for a lifetime."—*Christian Union.*

"Prof. Sizer, whose experience and observations are of much value, has succeeded in giving his ideas in a form so simple and perspicuous, that he who runs may read and understand."—*Rural New Yorker.*

"No teacher, who loves his vocation, should neglect to read this well-written and well-printed contribution to the cause of education."—*Christian Instructor.*

AMERICAN
Institute of Phrenology.

Autumn Class—Tuition Reduced.

IN announcing the close of the summer class for 1877, and the class for the autumn which is to be opened on the 6th day of October next, the managers of the American Institute of Phrenology congratulate themselves, their pupils, and the public. The class which assembled in July, though not large in consequence of the stringency of the times, was distinguished for exceptional ability, scholarship, close attention to the subjects of instruction, and an eager interest to know all that can be known of man physically, intellectually, and morally. According to present indications it is believed that a large class will assemble in October. Not a few who hoped to be with us during the summer term were obliged to adjourn their attendance to October.

Every year shows new interest in the great subject of mind-study. Principals of public schools and academies are turning toward phrenology and physiology as a means of enlarging their knowledge of human nature, and of giving them a better philosophy for imparting instruction to those committed to their care. Business men are beginning to learn that there is a scientific way of judging mind and character which will help them to decline business associations with those who are unbalanced, erratic, or dishonest. Mothers who have children to educate, guide, and govern, are earnestly turning to phrenology for that aid which it affords. And those who seek self-culture for personal improvement and happiness are more than ever anxious to learn what this comprehensive science of human nature can teach them.

If officers of banks, insurance companies, and business men generally could know how much a course of instruction in phrenology would enhance the value of their confidential agents who have large interests and important customers to manage, and must needs deal with "all sorts and conditions of men," there would be a demand for an INSTITUTE OF PHRENOLOGY in every large commercial town; not holding sessions once or twice a year, but continuing in session as long as colleges and academies are occupied in their annual work.

Prof. S. S. Packard, principal of a great business college on Broadway, New York, has the sagacity to appreciate the value of phrenology to teachers and business men, and has obtained some phrenological lectures, within the present year, before his college students; and we venture the assertion that these bright young men who are destined to control the rudder of business wherever they move, will ever profit by the brief instruction in character-reading imparted to them by those lectures.

It is not to the professional phrenologist alone that the AMERICAN INSTITUTE OF PHRENOLOGY appeals; for while all who attempt to practice the profession as such will appreciate the value of the thorough course of training and instruction in theoretical and practical phrenology which can be obtained nowhere else except in the AMERICAN INSTITUTE OF PHRENOLOGY, it would be wise economy for all teachers, managers of business, salesmen, commercial travelers, statesmen, physicians, lawyers, and ministers to learn the truths which phrenology and physiology unfold in respect to human nature; how to train it, manage it, and govern it. People strive with each other intensely and ignorantly, annoying and vexing one another, wishing to live harmoniously and appropriately together, and to exercise in business, and in social life, those functions of comity and interchange which

belong to the various phases of life and business; yet there is such attrition, such cross-purposes, such friction and irritation, that life is verily a struggle. Men do not wish to quarrel; they seek to be harmonious; they wish to comport themselves toward all men kindly and justly, but they understand human nature so little, and do not know how to adapt themselves to persons of different dispositions, having no settled philosophy of mind, that they seem better informed in almost everything else than in managing the customer.

A physician learns pathology, can make a sharp diagnosis of the condition of the patient, but knows nothing at first about the disposition of his patient; how to soothe, govern, regulate, and lead upward the nervous invalid he has to deal with. A lawyer may understand his brief and the laws relating to it, but his jury and the witnesses are to him a *terra incognita;* that is, land which he surveys like a blind man trying to walk over a rough territory—he finds the impediments by stumbling over them; he learns to avoid difficulties when it is too late to profit by it. The lawyer sometimes mars his case before he learns how to manage it.

In short, *human nature* enters largely into every transaction, and he who knows how to understand and read human nature at a glance makes life's duties flow smoothly, successfully, triumphantly. That minister, lawyer, physician, merchant, teacher, parent, who has the natural tact and sagacity to understand character by intuitive instinct better than his fellows do, is the one who rises to distinction in his or her field of effort. Occasionally a mother is renowned as far as she is known for the happy, successful manner in which she trains her family, guides her conduct toward everybody, and makes herself a benign center of potent influence. One says: "I try hard to please my customers, my pupils, my clients, my children, my neighbors, but somehow everything goes against me." Students whom we have instructed at the INSTITUTE, have gone back into their vocation, and seemed to themselves to be in a new world. They have learned how to "rub the cat the smooth way," for as soft as fur is, there is a rough way to rub it, and the best of human beings like to be rubbed the smooth way of the grain.

Instruction in this science teaches men how to understand and use their own faculties as well as how to understand the dispositions and talents of strangers, and therefore what faculties to call into action to produce the desired results. The pianist learns by studying the musical score what keys to touch to evoke the harmonies, and how to avoid the discords. She may not attain any extra muscular power to operate the keys, but learns which to touch.

As all business, all science and learning, and nearly all of human happiness and success grow out of the right action of the mental faculties, the study of this great theme is the crowning field of effort, for how valuable soever may be the knowledge of the sciences which relate to outward things, engineering, agriculture, manufactures, commerce, they must all take a place second to that which deals with the human mind itself. Food and raiment perish with the using, but whatever relates to the mind, to the inner and higher manhood, must take the highest place in human consideration.

THE SUMMER CLASSES OF 1877.

CLOSING EXERCISES.

On the evening of August 10th, the Session of the Summer Class of 1877 was brought to a close. The following is a condensed report of the proceedings:

MRS. WELLS' ADDRESS.

WANTED! is written everywhere—Honor, Honesty, Knowledge, Power, are wanted. Still, these are abundant for all—they wait only for us to reach forth and grasp and use them with intelligent action. Whatever will aid us in acquiring these, it is our privilege to make use of, whether it be in science or in art, or both combined. Phrenology being one of the helpful sciences, it is well that you should obtain the knowledge that would enable you to make practical use of it, and that is the art which you have been acquiring. Will you now hide your talents or bury your ability to help others along in the world?

More will be demanded of you than ever before, and if you do not make the best use of this knowledge—with honor, honesty, and intelligent action—you will see written everywhere, and upon all things—*Wanted.*

Your responsibilities have increased with the capabilities you have acquired here, and your accountability will be augmented accordingly. Then step forward and fill the gap, for you are all the better prepared to enter important positions, and the straight and narrow way will prove more desirable to follow than the broad one.

We shall be anxious about your reputation, for our graduates are closely watched and criticised. Let your record be always clean. Hitherto none of them have disgraced themselves or the cause, to our knowl-

edge, and we have confidence to believe none of this class will be the first to make us wish to disown them. If you have reason to be proud of yourselves, we shall have reason to feel thankful.

Let your light shine like stars in a cloudless night, and so comport yourselves that flaws could not be found even with a telescope. "Be ye therefore perfect" was not said without a meaning.

You seem to us like a part of our family, and it will not be pleasant for us to say farewell. Still, it is best for you to be up and away, and we bid you a cordial God-speed!

MR. DRAYTON'S ADDRESS.

YOUNG GENTLEMEN OF THE SUMMER CLASS OF 1877: This, I regret to say, is the last occasion on which we meet on that footing of instructors and pupils, which I trust has been very pleasant to you—it certainly has been to me. You are now going out into the world to illustrate what we deem the truth in Mind—in Mental Philosophy. You came here, a few weeks ago, with certain views with regard to the philosophy of the mind and Phrenology, and you may have entertained certain doubts with respect to Phrenology, and came to us to have those doubts dispelled. Perhaps our instruction has enabled you to dispel them, in great part at least.

You go abroad with certain impressions that have a convincing influence upon your future activities. You know more about the subject of Phrenology now than you did when you entered the Institute; more concerning yourselves; more concerning humanity; and have gained in strength and capability.

I have but one line of thought to present to you in the few minutes allotted me, and it may be premised by the injunction: "Have one object in view—one definite object."

A few days ago, while making some remarks before you, a question was propounded which indicated a disposition to enter upon the consideration of extraneous subjects. Of course, we claim that every subject has a kindred relation to Phrenology—every subject which humanity can entertain; but there are many subjects which must be looked upon as aside; and as the world progresses, and men are becoming specialists, we must have some definite purpose—some one vocation with which to cut our way through life.

You know that in the days of Rome, when that nation was in its glory, there were certain public men who were called *lictors*. They carried the *fasces*, or emblem of authority. The *fasces*, it is unnecessary for me to state, was nothing more than a bundle of rods, with an axe in the center. Now, I wish to liken your efforts, in connection with Phrenology, to these *fasces*, the central energy or impulse—the principles which we have endeavored to fix upon your mind—being the axe and the material *data*, the aids which you shall employ for the application and illustration of those principles, being the rods closely allied.

Men of one idea are the men who contribute to the progress of our civilization. I do not like the term "one idea," yet when I consider the specialists of the day—such as Huxley, Tyndall, Thompson—and recently we have heard of another, a very remarkable man by the name of Edwards, a naturalist in Scotland—I appreciate the power which one-ideaism gives to character. But it is not necessary that in carrying out one object, one purpose, you should render yourself conspicuous for anything like eccentricity. My objection to the "one idea" is on the score of its contributing to eccentricity of thought and action.

Now, Phrenology will save you from eccentricity, simply because it enables you to understand your own characters, and so to avoid many errors, many irregularities, and to preserve your integrity. Do not be one-sided. If you earnestly study man in all his parts—in all his relations—you can scarcely become one-sided.

In your relations with others, keeping this one-idea object in view, let them understand that you illustrate in your practice the truth as you understand it—that you are honestly acting a decided part, and are seeking to do others good. In your treatment with others, impress upon them the fact that they are human. We forget too often that we are human. We are inclined to arrogate to ourselves characteristics which are above the human, and so we very often act in a manner which is beneath the human. Speak the truth. You have the best opportunities in the world for admonishing others with regard to their errors. You have ways and means of reaching the inner man—the habitation where the spirit dwells—opportunities and privileges which no other class of men possess. So, let this be a sort of talisman for your guidance. Speak the truth, bearing in mind what a poet has said, "Speak truly, and thy word shall the world's famine feed."

DR. NELSON B. SIZER.

As this is the last opportunity which I shall have, in company with the other instructors, of talking to you as a class, I desire to impress upon your minds several points in the study of the human individual, Man, as you will find them to aid you in every way. As the mind is undoubtedly the crowning part of the human body, and as it makes man the crowning animal by his possession of mind, so it is the last part of the human being which should be studied. Not that the study of mind is of less importance than any other part, and should, therefore, be put off to the last. Far from it. But in order to understand the mind in its practical applications, that is, mind as it influences the body, we want to study the rest of the body first, because, if we commence with the study of the mind, the brain and its functions at first, we are only baffled and puzzled by running against snags of fact and theory which we do not know anything about; things we should have known beforehand. And, therefore, you should make yourselves masters of anatomy and physiology particularly; especially in the case of the nervous system. You should keep yourselves abreast with all the leading investigations of the day. When you buy text-books do not buy old editions, for it is harder to unlearn two or three errors than it is to learn a dozen new truths. As you go on in teaching Phrenology, in lecturing, as I suppose many of you will, you will find people who think, who know a good deal, and some of whom are very well posted, asking you tough questions. If there is anything which puts a man in a bad position, it is to claim a position as teacher on any subject, and to find himself discomfited before an audience. For that reason you want to be masters of anatomy and physiology. Strive to keep up the honor of the profession which you have studied. If there has ever been a curse to any profession, it is the presence of unworthy members. Lawyers are scandalized by those that are called shysters. In my own profession we have any number of ignorant and presumptuous quacks. And so it is with your profession. There have also been masters in Phrenology. Strive, then, to raise the general average of your profession, and raise yourselves by doing so. Do not make statements about things, and vindicate views which you are not prepared to back up by your own practice. You know theologians make a difference between didactic Christianity and experimental religion. The one is the thing the man reasons about; the other the thing he lives out. Now, just so with you. If you talk against habits of eating, of drinking, of anything which you think wrong, your opinion will not amount to anything if you do not follow out your own principles. You can preach all day, and if people hear you speak things you do not practice, your argument will fall to the ground.

As far as my own experience goes, I have had a great deal of pleasure in teaching what I could to you, because you always seemed eager to learn, and wished to know more.

We all wish you success, and wherever you go you will be watched anxiously from here, because we feel our own reputation to be linked with yours, and yours with ours. We trust you will never disgrace the Institute nor yourselves.

MR. SIZER'S ADDRESS.

STUDENTS OF THE CLASS OF '77: We have come to the close of our work. For more than half a hundred times I have stood before you, giving you so far as I might be able to do, the best effort and the richest experience of nearly forty years of labor in this great cause. How many more years it may be vouchsafed to me to address students, is known only above; but while I live I trust I may be able to do something to forward the cause, which, to my mind, seems central in this great working world.

When I stop to consider what is our field of effort, when I look forward up that bright vista into which you to-day enter with hope, possibly with fear and anticipation combined, I ask myself, What is it that we undertake to teach; what is it that we undertake to do for the human race? It is not our primary object to make men richer; it is not our object to flatter men, but to open to them the laws wh

govern human nature in its highest type of development; to show them how the human soul's yearning for light and liberty and power may find its best passport to high achievement and grand result. We do not offer you on entering this profession great or sudden wealth. Your work is that which aims to elevate men, and rid them of habits to which they may be wedded; and this kind of work is not always welcome to the recipient. But faithful service shall finally win respect, confidence, and reward. Dr. Gall, the discoverer of the true science of mind, was obliged to leave his native country and labor in a land of strangers, but he so vindicated the grandeur of his work that the brightest minds of that grand center of science and learning, Paris, stood over his grave and shed affectionate tears to his memory.

Remember, gentlemen, that you go as pioneers in a great work; a field occupied by few; I venture to say the field of highest human endeavor; for while the teacher and the preacher, the lawyer and the physician treat human beings who are advanced in development, and try to curb them within certain fields of effort, and restrain and guard them against wrong; your business it is to teach parents how better to give life to and train children who shall stand on a higher plane than the parents themselves; to teach the mother, when the infant cherub reposes upon the maternal bosom to see in its organic structure how she must guide and cultivate him to make him worthy of his ancestry, and worthy of a higher and better life. You do not cater to the fashions of the body. It is your business to strike at the root of human life, and teach mothers how to tr in their children for honor and immortality; it is yours to teach the teacher how to guide and regulate the young mind as it is advancing into the active duties of life, and thereby to give to the world a generation of educated people, who shall illustrate virtue as well as adorn science and literature. Men are justly honored in the walks of physical science; these studies are important; but they sink into comparative insignificance when we investigate the immortal mind, the highest and best work of the Creator; and it is with pleasure and with pride that we open to your longing vision, and to your eager energy, this great field which you are to occupy when those who have helped you into it shall have ceased to work on earth.

It remains to us now, gentlemen, to give to you the right hand of fellowship, and welcome you into the fraternity of Phrenology. We have for each of you a diploma which shall be to you a passport to the respect and confidence of all men, an evidence that you have passed the ordeal of instruction here afforded, and that you are better qualified to go out into the world and publish this subject than those are who have not had such opportunity. You come to us from widely separated homes; from Canada to Tennessee, North and South; from New England to Iowa, East and West, you come, and we welcome you, one and all. Remember as you go out from among us that our affections, our hopes, our counsels, if need be, go with you. Your names and your faces will remain familiar to us; the eager earnestness with which you have listened to our instructions will not be forgotten. As you grow into stalwart manhood in this work; as your names become celebrated through the length and breadth of the land, as we trust they may, it shall be our pleasure and our pride to remember that you have been students of ours, and that we have helped you into this great field of labor. Remember as you go out from us that there are five millions of anxious mothers who are asking themselves, What can I do to guide my boy to honor and happiness? What can I do to make my daughter illustrate virtue, intelligence, and affection? Remember that tens of thousands of teachers wait to be instructed by you and thereby aided in their great work. Remember that five millions of young men to-day, in schools, in colleges, and in every department of business, stand on the threshold of active life anxiously waiting to know what they shall do, and what course of life they shall pursue. It is your business and your function to give them the guidance they need; to prescribe to every man a proper occupation, whether it be called high or low, and you thus give him a passport to ultimate success. Men strive through approbativeness and morbid self-esteem for positions they are not capable of filling, and they fail; and the tens of thousands of failures which crush out hope and discourage mankind arise from overweening vanity for something better than they are able to do. If you can tell a man he is best fitted to be an agriculturist, and that he will make a good one, you have done him a service, and saved him from fruitless effort in other vocations. Remember that when you have described the character of ten men and told them the best way to live, and what they are best adapted to pursue, you have added ten per cent. to their power and value. Every day of your life you can add one good man to the stock of human life by making every man whom you advise and instruct, ten per cent. better, wiser, and stronger; and if you have ten customers a day, you will have added day by day the value of a man to the race without increasing the number. You have raised each man in the scale of human life, and this you may do every day that you shall practice this profession.

Do not forget, gentlemen, to improve yourselves. Accept culture; learn every day; be wise, be true, be temperate; work for the honor of the theme which you sustain, and you shall work out reward. I have seen men start into this field anxious to pile up money and make themselves rich, so that they could retire and be independent. I have never known one such man as that who was a success in anything but money, and that is the meanest kind of success, if it is sought merely for its own sake. But whenever a man has sought to be true to his science, and true to himself, and true to his fellow-men; whenever a man has felt, Now I have a brother under my hands, and I must make men wiser and better, richer and broader in all that belongs to goodness and wisdom; such men have always made advancement, they always attain to honor and to competence. To this mode of doing business, to this method of exemplifying your skill we commend you, and confidently trust that you will have abundant success.

REMARKS BY MEMBERS OF THE CLASS.

Mr. Keith—It is with a shade of sadness that I contemplate the dismissal of this class. Our associations have been mutually pleasant and profitable, and have generated the nucleus around which will gather the fruits of experience and the investigations of maturer years, and over which memory will fondly linger. In whatever field of effort we pay our dues to nature, labor must carve the forest pathway to success. As phrenologists, we can offer no exceptions and accept no amendments to this God-ordained law. Our field will be measured by our capacity, our station by our talents, our reputation by our worth, and our success by our stability and force. In entering the realms of character-reading we must trample on the emblems of inactivity and with the axe of discrimination and truth hew to the line. Our precision is only fettered by our ignorance. The capabilities of Phrenology are as broad as the mind with which it has to do; its results as important as life itself. Upon us, individually and all, rests a magnitude of duty unequalled in any other sphere of human labor. Let us look forward, then, unflinchingly to the great ends which the All-wise Creator dedicated to the culture of the soul. Nor should we get weary and faint by the way. Phrenology is a healthy plant. For nearly a century it has withstood the inclemencies of a skeptical world, and now the aroma of its roses is inhaled by learned nostrils that dare not deny its presence and its worth. Its *universal* acceptance is only a question of time. Then let us be honest with humanity and with ourselves. Life is *too* short to indulge in idle vagaries and *too* valuable to be devoted to the aggrandizement of self. Let us never abuse our responsibilities. In the consciousness that we are right, let the *pinnacle* of knowledge be our aim, and when the boundary lines of the other country are made visible by death, let our deeds insure a passport, and our virtues embalm us in the memory of the people. We separate to labor in one common cause. Our *paths* diverge, yet radiate toward a common center. Then, in whatever field we labor, let us *strike* for the dignity of the science and the dissemination of its truths. For one, in my profession as a journalist, I shall exert my humble influence to open the door to the knowledge of mind and to the important truths which have been engrafted upon my memory by the able professors and teachers of the American Institute of Phrenology. I am confident you will all do likewise in your various avocations, and that the summer class of 1877 will be a *credit* to the science and to the Institution from which it derived its vitality and strength. May the Power that rules the destinies of the nations, be with you. God bless you all.

In conclusion, I acknowledge with gratitude the attention and kindness of our several instructors.

Our veteran teacher, Mr. Sizer, has labored earnestly and long, and with a spirit of disinterestedness as to selfish motives. He has pruned our crude ideas with the keenness of his judgment and bathed the wounds with the congeniality and temperance of his nature. His experience has been to us a great lesson. Let us profit thereby. From Mrs. Wells, Mr. Austin, Mr. Drayton, Mr. Turner, and others, we have received the most courteous attentions; and from those who acted in the capacity of teachers, the most sound instruction and advice. We shall ever regard them as our fraternal friends in the great work before us, and as our advisers in the difficulties that may overshadow our success. I earnestly desire the building up of the Phrenological Institute. It represents the center from which can emanate the truths of the science. To it is due, to a great extent, the perpetuity of sound phrenological doctrines. Then, fellow-students, as we scatter the fruits to a hungry world, let us *never forget the parent tree.* Au revoir.

Mr. Hilleary—TEACHERS: As I am about to separate from you now as instructors, I wish you to accept my thanks for the knowledge of Phrenology which has been received by me at your hands, and also its kindred sciences. I trust that I have, from your plain instructions and teaching, derived a knowledge which shall benefit me, whether I attempt to teach it or not. I trust that I have a knowledge of what Phrenology should be, and that I may practice its teachings.

FELLOW-STUDENTS: I hope that all of us, if we attempt to teach this science to others, may teach it as Phrenologists in the true sense—not in the general sense of that term; that is, let us live out and practice its teachings; and though we may not bring others to the same height, we may teach them the proper study of mankind.

Mr. Worrall—I am thankful I have learned so much of the science of Phrenology. In looking at the different sciences, I chose it as the most useful to mankind, and I believe it is true. We know how widely mankind differ, and Phrenology explains the cause. I hope, from what I have learned here, I may be able to do the subject justice in the way of teaching others, and follow its instructions myself.

I desire to return my sincere thanks to the teachers of the Institute, and rejoice that such a collection of specimens has been gathered for the benefit of the public which I have been permitted to study. I must say that I am grateful for the kind and earnest instructions I have received. To the students I would say I wish you all success, and bid you good-bye.

Mr. Staples—RESPECTED TEACHERS AND CLASSMATES: The farewell scene is ever one of sorrow, and the heart that feels no sadness while the lips speak the word *adieu* must, indeed, be cold. Whether the speaker has endeared himself to any during his stay at this Institution is not for him to say; but he does know that there are those among the Faculty and students whom he will not so n forget, and whose kindness, as manifested in a thousand ways, will ever call forth his gratitude and love. He will remember her whose labors in the phrenological world no man can measure, and whose name will be enshrined among those of the truly great, so long as appreciation shall endure. He will often call to mind the familiar face and fatherly care of him who has so often addressed us upon the various subjects relating to the theory and practice of Phrenology, and whose instructions should prove beneficial to each, by engendering in the soul more of the love for the beautiful and true, helping us to realize more the worth of the life which now is, while we fit ourselves for the enjoyment of the life which is to come, when these longings that find no perfect gratification amid the struggles of this mortal existence shall be satisfied in the full fruition of our fondest hopes. Though we may be familiar with books, there is a practical knowledge, a freemasonry, as it were, of the science, which we can only receive from the lips of the living; doubly precious when it is given by one who has grown gray and venerable in the work. We will not be unmindful of the thoughts which have been set forth by him who to-day is known as the editor of the PHRENOLOGICAL JOURNAL; and I trust that the historical pictures which he has drawn will remain upon our minds as bright incentives to noble action, while we strive to emulate the greatness of those who have identified themselves with this new and beautiful science, which brings to him who follows its teachings the inestimable boon of self-knowledge.

The lectures on Anatomy and Physiology have been full of interest, showing the instructor in this department to be most thoroughly versed in all the minutiæ of that science which he so happily expounds; nor will we lose sight of the useful suggestions received while being instructed in the beautiful art of elocution by one who has endeared himself to all. With all the thankfulness and esteem which your kindness and regard for me during my stay in New York has called forth, let me say to the Faculty of this Institute, as I leave to enter upon the field of labor, Farewell!

To you, my classmates, I have but a word to say. Let us not be content with meager attainments. Rather let us be all that we are capable of being in every noble sense; then shall our ambition be a constant incentive to further effort in the cause of right. If we are true to ourselves, to our fellows, and to our God, in the fullness of time we may meet together in our Father's blessed home above.

D. C. Catlin—TEACHERS AND FELLOW-STUDENTS: I do not regret having taken a course of instruction at this Institute, for I shall return home perfectly satisfied in regard to many things which I will not speak of here. I believe that Phrenology has been of some benefit to me in the past, and I have no doubt that it will be of still more service to me in the future. I do not find Phrenology to be at variance with the Gospel; on the contrary, I can hardly conceive how any one can be a true Christian without practicing the teachings of this science. It tells us *why* we should throw the mantle of charity over the misdeeds of our fellow-men, and teaches us *how* to do unto others as we would that they should do unto us. When nature's laws are recognized and obeyed as God's laws, then, and not till then, shall we be able to say that the millennium has come. To teach the people what are the laws which they must obey in order to live happily, and hasten the good time coming, is the great work which we, as phrenologists and philanthropists, have before us; and let us go forward and endeavor to perform that work in the name and spirit of Him "who went about doing good."

Mr. Winkler—The first I heard of Phrenology was in 1863, when I met with a price-list of works published by Fowler & Wells. I sent for some of the works, studied them, and became much interested in the subject, and became convinced of its great importance. I would advise all to study Phrenology. For fourteen years I have felt thankful for its instructions and its great benefit to me, and I hope to aid in extending it among the American people. I tender my sincere thanks, to all connected with the Institute, for the kindly interest shown me during my attendance.

Mr. Beall—It is not without regret that I realize this to be our closing day, for our relations have been of peculiar interest to me. The chief subject upon which we have been engaged has been for many years, in a certain sense, a part of my existence. I could not express to you how much I am indebted to Phrenology, but I have learned by bitter experience, as well as by study, the importance of self-knowledge; and I know that this is the only system of Mental Philosophy which can give self-knowledge, explain the wonderful phenomena of human mentality, and show the individual what he is, and which part he is fitted to play in the great drama of life. I think that the influence yet to be exerted upon human destiny by Phrenology will be deeper and far more extensive than has ever been supposed, even by its most ardent supporters. We acknowledge man to be the epitome of the universe, and mind the ultimate of man; hence, there can be but one step higher, namely, knowledge of God. The world does not yet appreciate this, but the day of final triumph must come.

To the instructors of the Institute, and to the members of the class, I desire to return my thanks for their uniform kindness to me, and to wish them the highest success in all their future efforts. I shall especially remember Prof. Sizer, not only for his elaborate exposition of Mental Science *per se*, but also for his valuable lessons drawn from the varied personal experiences and observations of more than half a century; and last, but not least, his genial, magnetic presence, and his humorous stories with which he has so often illuminated, as it were, the rusty skulls upon which we have been at work. I assure you of my sympathy with you all in the duties before us, and I sincerely hope that we may be true to our cause, and live to see it honored by all the world.

THE

American Institute of Phrenology

THE AUTUMN TERM WILL OPEN

Mr. Eadie—TEACHERS AND STUDENTS: I am deeply impressed with the importance of the principles which have been here expounded. We hold in our possession knowledge for the want of which thousands go blundering on, doubling their misfortunes and sorrows, and lessening their pleasures all the way down to the grave. We are now called upon to disseminate this knowledge; to put men in their proper places; to tell them how to establish right relations between themselves and their fellows; how to use the faculties God has given them for the ends for which they were created. This is a work worthy of the best efforts of any man. It is a work of practical benevolence. When the world begins to realize the truth of these principles; when its masses come to understand and practice them, there will be no further need of asylums, jails, and poor-houses.

We believe the science of Phrenology to be the true philosophy of mind, and as true philosophy is a revelation of the Divine Will manifested in creation, it is harmonious with all truth, and can not with impunity be neglected.

I trust that all who enter on this work may labor earnestly and conscientiously to discharge the duties and responsibilities they thereby assume.

RESOLUTIONS BY THE CLASS.

WHEREAS, We have attended the course of instruction of THE AMERICAN INSTITUTE OF PHRENOLOGY, and are in sympathy with that branch of science here taught, and any measures to promulgate the same. We desire to express our respect for its officers and lecturers, and thanks for the courteous treatment we have received at their hands.

Resolved, That we regard Prof. Nelson Sizer as an able advocate of the science of Phrenology. His lectures on the practical application of the science, and his able analysis of the human mind have been definite and concise.

Resolved, That the lectures of H. S. Drayton, A.M., on metaphysics, the former systems of mental philosophy, and the development of Phrenology, have been profound and comprehensive.

Resolved, That we are greatly indebted to Dr. N. B. Sizer for his very thorough lectures on anatomy and physiology, and dissection of the human brain.

Resolved, That we find in Mr. Austin a cultured elocutionist and a perfect gentleman.

Resolved, That we are specially indebted to Dr. Ordronaux for his able and instructive lectures on insanity.

Resolved, That the lectures of James B. Richards, A.M., on Idiocy and its treatment, deserve our earnest attention.

Resolved, That we return our thanks to Mr. Fishbough for his interesting lectures on Psychology.

Resolved, That we owe Mrs. Wells our sincere thanks for her cordial welcome extended to us, and her interesting reminiscences of the earlier advocates of the science in this country.

Resolved, That we tender our sincere thanks to S. R. Wells & Co. for their kindly interest in us, and recommend their commercial integrity to all who may have occasion to deal with them.

FIELD NOTES.

MOST lecturers find it expedient to rest during the summer months in order to recuperate health and strength, and be ready for a vigorous campaign during the lecturing season. Phrenologists are somewhat an exception to this rule. Some of them continue their work right through the season, but many of them rest. We have, therefore, heard from but few since the issue of the last Supplement, and we give below a report of such as we call to mind. In a short time all will be in the field with the harness on, and have the best wishes of the managers of the AMERICAN INSTITUTE OF PHRENOLOGY.

Mr. L. C. Bateman has not been in the field during the past summer months, but has now commenced work, and writes us that he will spend the fall and winter in Maine, revisiting places where he has been before. No doubt Mr. Bateman will find this a pleasant and profitable method.

Mr. U. J. Hoffman has continued his connection with the Normal School at Valparaiso, and we shall expect, if he remains there during the coming season, that many teachers will receive a practical insight into Phrenology.

Mr. T. J. Wyscarver has been lecturing in Ohio during the summer months. We hope he may be encouraged to devote his whole time to Phrenology.

Mr. Duncan McDonald has spent the summer in Colorado lecturing some, but, we judge, spending a part of the time in caring for a juvenile partner, whom he announces has gone into business with him. Mr. and Mrs. McDonald will accept congratulations.

Mr. Howell B. Parker has been resting during his summer vacation, but has not been idle, for he has been talking up Phrenology wherever an opportunity presented itself. He re-opens his school, and is introducing some of our Phrenological works as text-books. We would there were more teachers who had the same interest in Phrenology that is evinced by Mr. Parker, practically and theoretically.

Mr. Thomas Clark continues his office at Paterson, New Jersey. He has also organized a Phrenological society or club. Meetings are held each week for the study and discussion of Phrenological questions and matters relating to kindred topics. He reports a good degree of interest as being expressed, and, no doubt, much good will come from this. We wish all Phrenologists, especially those who are located, would take steps to the formation of societies. The Paterson *Daily Press* speaks of Mr. Clark's arrangements for a public Phrenological examination of the heads of the prisoners of the county jail.

Mr. Ira L. Guilford has spent the summer in Michigan. We presume he will continue his labors there during the winter.

Mrs. E. P. Gause has been resting during the summer months with her friends in North Carolina. She undoubtedly will enter the field again this winter and make her influence felt.

Mr. Ralph Rogers has spent the summer in Tennessee and Kentucky. He finds this is a good field in which to work, and we hope he will continue there during the coming season. We do not know why he should seek other quarters.

Mrs. M. J. Holt has returned to Texas, her home, and we shall expect during the coming winter months to hear favorable reports from her there.

Rev. Geo. A. Lee has located in Guernsey Co., Ohio. He is preaching and indoctrinating the people with Phrenological ideas, and is also lecturing on temperance.

Mr. Levi Gaumer continues his studies, ordering whatever is new and instructive.

Dr. C. A. Beverly has been resting during the summer and working some in Wisconsin. The Milwaukee papers speak well of his efforts.

Mr. P. E. Ballou gave us a call early in the season, and has been lecturing in New York State and other places during his travels this summer.

Mr. L. Emerick has prepared himself for a vigorous fall and winter campaign. He writes us he is prepared to respond to invitations for single or course lectures. His address is Jacksonville, Illinois.

Mr. Matt. W. Alderson has lectured and practiced some, but has spent most of his time in studying and preparing for the field.

Mr. J. N. Hardy has been lecturing in Wisconsin. The Beaver Dam *Citizen* speaks commendingly of his lectures and examinations.

Mr. Levi Hummell is still lecturing in Pennsylvania and meeting with good success, when we consider the hard times that have prevailed in that part of the country. He proposes to go into Ohio.

Miss May Chapman is making her influence felt in Boston and vicinity in the interest of Phrenology and Physiology. We have seen recent reports of her lectures, especially in connection with the Ladies' Physiological Institute of Boston.

THE

American Institute of Phrenology

THE AUTUMN TERM WILL OPEN

October 6th, 1877.

PRICE OF TUITION REDUCED.

In consideration of the hard times, and with a desire to increase the number of students in attendance, the price of tuition is reduced for 1877 from $100 to $75, for one full term, including diploma. It is not decided to continue this reduction beyond the present year, and those who would take advantage of it should avail themselves of this opportunity.

THE COURSE OF INSTRUCTION

At each term is complete, consisting of about one hundred lectures and occupying six weeks of time.

This is the only institution of the kind in the world, where a thorough course of practical instruction is given, and nowhere else can be found the facilities which the AMERICAN INSTITUTE OF PHRENOLOGY possesses; consisting of a large Cabinet of Skulls, Busts, Casts, Anatomical Preparations, including Manikins, Skeletons, Plates, Models, etc.

THE AMERICAN INSTITUTE OF PHRENOLOGY was chartered by the Legislature of the State of New York in 1866, in order to establish permanently a school, in which the whole subject should be taught and students be qualified for giving public lectures and applying Phrenology professionally to choice of pursuits, domestic and scholastic education, and to all the phases of social and moral life.

THE AMERICAN INSTITUTE OF PHRENOLOGY proposes to teach students how to lecture and describe character on scientific principles; how to become practical phrenologists and delineators of character. The science needs more public advocates, and the world will gladly extend its respect and patronage to those who are qualified to deserve them.

Clergymen, physicians, lawyers, teachers, and business men not expecting to make Phrenology a profession should study it as a means of learning how to read character and how to understand, instruct, and manage those who come within their sphere of activity.

Among the topics treated in the course of instruction, the following will receive special attention:

Outlines of Anatomy, particularly of the Brain and Nervous System, and also of the Vital Organs; their office in the maintenance of bodily vigor and the proper support of the brain.

Physiology; its general laws; reciprocal influences of brain and body; the nervous system; respiration; circulation; digestion and assimilation; growth and decay of the body; air, exercise, sunlight, and sleep.

The Doctrine of Temperaments, as giving tone and peculiarity to mental manifestations, also as affecting the marriage relations, or what constitutes a proper combination of temperaments for parties entering into the marriage state, with reference to their own happiness, and also to the health, character, and longevity of their children. This branch of the subject will require several lectures and will be copiously illustrated.

Insanity, Idiocy, and perverted and abnormal mentality will be explained by eminent experts in those departments.

Food and Diet.—Nutrition, its laws and abuses: what food is best for persons of different temperaments and of the various pursuits What to eat and what to reject to become fat or lean, or to feed brain or muscle; influence of bodily condition as affecting mind and character; stimulants, their nature and abuse; alcoholic liquors, tea, coffee, spices, vinegar, tobacco, opium: their effects on the bodily conditions as affecting mind and health; what to avoid, and why.

Comparative Phrenology; the development and peculiarities of the animal kingdom; hints toward their gradation in the scale of being, from the lowest to the highest, including the facial angle, embodying some curious and interesting facts relative to the qualities and habits of animals, all tending to show that disposition is according to organization.

Human Phrenology; mental development explained and compared with that of the lower animals; instinct and reason, the line drawn between them; the phrenology of crime; imbecility and idiocy, causes and management; insanity, its causes, and how to treat it.

Location of the Organs of the Brain; how to find them and estimate their size, absolute and relative, a matter of great importance—indispensable to the practical phrenologist.

The Elements of Mental Force—courage, energy, perseverance, and industry—and how to estimate them in the living person, and train them to become the servants of virtue and of success in life.

The Governing and Aspiring Group of Mental Organs, their influence on character and in society, and the mode of estimating their powers and regulating their action.

Self-Protecting Group of Faculties, their location and how to judge of their size and influence in the economic and decorative phases of life.

Division between the Intellectual, Spiritual, and Animal Regions of the Brain; how to ascertain this in a living head.

Memory, how to Develop and Improve it; its nature, quality, and uses.

The Reasoning Faculties, and the part they play in civilization, and in the great developments and duties of human life. How to judge of the size of these organs, and how to cultivate them.

The Examination of Heads Explained; practical experiments; heads examined by each of the students, who will be thoroughly trained and instructed how to make examinations, privately and publicly. Special training in the examination of skulls.

The Combination of the Organs, and their influence on character. How to ascertain what group or organs most readily combine in an individual, and how to determine his mental tendency or leading traits of character; how he may correct his errors and improve himself.

The Moral Bearings of Phrenology and a correct Physiology; home training of the young, and self-culture; Phrenology applied to education, to matrimony, to legislation, and to the choice of pursuits.

Matrimony; its laws and the proper developments of body and brain, for a true and happy union. How to determine this.

The Natural Language of the Faculties, philosophy and bearing on the reading of character as we meet people casually as strangers.

Physiognomy—Animal and Human; or "Signs of Character," as indicated in the face, form, voice, walk, expression, and so forth.

Ethnology, and how to judge of Nativity and of Race, especially how to detect infallibly the skulls of the several colored races.

Biology, Psychology, Mesmerism, Clairvoyance, etc., explained.

Resemblance to Parents, or how to determine which parent a person resembles, and what features of face, what classes of faculties, and what portions of the general build are inherited from the father, and which from the mother. A most desirable attainment for any person, especially so for the practical phrenologist.

Objections to Phrenology Considered. How the skull enlarges to give room to a growing brain; the frontal sinus; loss or injury of brain; thickness of skull; fatalism, materialism, moral responsibility.

Elocution, how to cultivate the voice. Eloquence, how to attain the art. Instruction in reading and speaking will be given by a competent and experienced teacher in oratory.

A Review of the whole, answering questions on all points relating to the subject which may be proposed by students. Each student will be carefully examined in the branches taught, and will give, in his own words, his knowledge on the subject.

How to teach Phrenology. Instruction as to the best methods of presenting Phrenology and Physiology to the public, by lectures and in classes; not only how to obtain an audience, but how to hold it and instruct it.

Dissection and Demonstration of the Human Brain, in detail, giving the students a clear view of this crowning portion of the human system.

The course will consist of One Hundred or more lessons, and it is proposed to give at the rate of three or more daily till completed; though the wishes of the class will be consulted. Terms of the entire course of instruction for 1877, with Diploma to graduates, Seventy-Five Dollars.

The Works most essential to be mastered are "How to Read Character," $1.25; Phrenological bust, showing the location of all the organs, $1.00

The following are exceedingly useful to the student, and they should be read, viz., Combe's System of Phrenology, $1.50; New Physiognomy, with 1,000 illustrations, $5; Constitution of Man, $1.50; What to Do and Why, and How to Educate Each Man for his Proper Work, $2; Phrenology Proved and Applied, $1.50.

All of the above works may be obtained at the office of the Phrenological Journal. Those who order the entire set, *to be sent at one time by express at their expense*, can have them by sending us $10. Post-office order or draft will be safe.

Apparatus for the use of Lecturers, such as portraits, skulls, and casts of heads, can be furnished to those who desire them.

Application for membership should be made at once that complete arrangements may be made. Address,

S. R. WELLS & Co., Pub'rs, 737 Broadway, New York.

Publishers' Department.

The business affairs pertaining to the publication and circulation of this Journal, and other miscellaneous and current matter, with advertisements, in general, are inserted in this department.

ANNOUNCEMENT.

The next number (September) will contain sketches, with portraits, of Richard M. Thompson, Secretary of the Navy; Thomas Cook, the distinguished Excursionist; and others; besides, Indolence in Literature, Life in the Deep, Theory of the Stereoscope, Light in Dark Places, continued, and other interesting and illustrated matter.

Time Extended.—In order that more may take advantage of premium book offers, we have decided to extend the time of this offer to the 1st of September, at which time it will positively be withdrawn, so that all who would take advantage of it must subscribe before that time; and to all who do send subscription price of THE PHRENOLOGICAL JOURNAL before September 1st, with twenty-five cents ext a as postage on JOURNAL and premium book, will be sent a choice of books from the list of premium books found on another page. Let present subscribers call attention to this offer among their friends and neighbors, and in this way extend to them an opportunity of being benefited and, at the same time, extend the circulation of THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH. Agents should canvass now.

The American Institute of Phrenology.—As this number of the JOURNAL is going to press, the class in attendance on the summer session of the Phrenological Institute are coming together. There is already a goodly number of very intelligent young men, and the session promises to be one of great interest. There is also a large number who have been prevented in attending the summer class, but who propose to be on hand at the autumn class, meeting the 6th of October. The reduction in price which has been made should induce a very full attendance then. It is not proposed to continue this reduction beyond the present year, and those who attend now will make a saving of nearly enough to procure for themselves a good outfit for starting in the lecture field. All who can, should make the arrangements to attend the Institute this fall, for a year's time lost in the phrenological field can not be made up. Those who desire further information and full particulars will send stamp for the Institute extra, containing terms, etc. Address this office.

Our Book Premiums.—Many have availed themselves of the book premium offer which we have made, but there are many more who should. And to enable our agent-friends to continue the good work still longer and effectually during these summer months, we have decided to continue this offer until the 1st of September. Therefore all who send their subscription with the subscription price and twenty-five cents extra as postage on the JOURNAL and premium book, before the 1st of September, will be entitled to either of the books offered. If other books of our own publication are desired instead of those named in the list, they may be selected, and will be forwarded by paying the difference in price. Let our friends take advantage of this offer, and induce others to join them in subscribing. Remember that those whose subscriptions have not yet expired may take advantage of the offer by subscribing in advance for another year.

The Emphatic Diaglott.—All connected with Sunday-schools are aware that for the coming six months the International Series of lessons are confined to studies in the NEW TESTAMENT, and in this connection we would say that all who are interested in Bible studies will be interested in procuring the EMPHATIC DIAGLOTT as an aid to their efforts in this direction. The book should be in the hands of every teacher and school superintendent, and every clergyman who has not a thorough and familiar knowledge of the Greek. The EMPHATIC DIAGLOTT contains the original text of the Greek Testament based on the best manuscripts that have been accessible, with an interlinear word-for-word English translation, together with a new rendering or version of the same; and this with the common version will afford the Bible student great aid in coming to a proper understanding of the meaning of the various passages in the New Testament. It will enable each one to form an intelligent judgment for himself as to the meaning, and not render it necessary to depend on the opinions of any commentators. The book is the result of a vast amount of literary labor on the part of the author, and of mechanical labor on the part of the printers. It is sold at $4.00; in extra library binding, at $5.00. It is also offered as a premium for three subscribers to the JOURNAL, at $3.00 each, with a book premium to each subscriber whose name is received before the 1st of September, with 25 cents additional as postage for each subscriber. All who desire it, and try for it with earnestness, will succeed Procure it now.

Food and Diet.—Nutrition, its laws and abuses: what food is best for persons of different temperaments and of the various pursuits. What to eat and what to reject to become fat or lean, or to feed brain or muscle; influence of bodily condition as affecting mind and character; stimulants, their nature and abuse; alcoholic liquors, tea, coffee, spices, vinegar, tobacco, opium: their effects on the bodily conditions as affecting mind and health; what to avoid, and why.

Comparative Phrenology; the development and peculiarities of the animal kingdom; hints toward their gradation in the scale of being, from the lowest to the highest, including the facial angle, embodying some curious and interesting facts relative to the qualities and habits of animals, all tending to show that disposition is according to organization.

Human Phrenology; mental development explained and compared with that of the lower animals; instinct and reason, the line drawn between them; the phrenology of crime; imbecility and idiocy, causes and management; insanity, its causes, and how to treat it.

Location of the Organs of the Brain; how to find them and estimate their size, absolute and relative, a matter of great importance—indispensable to the practical phrenologist.

The Elements of Mental Force—courage, energy, perseverance, and industry—and how to estimate them in the living person, and train them to become the servants of virtue and of success in life.

The Governing and Aspiring Group of Mental Organs, their influence on character and in society, and the mode of estimating their powers and regulating their action.

Self-Protecting Group of Faculties, their location and how to judge of their size and influence in the economic and decorative phases of life.

Division between the Intellectual, Spiritual, and Animal Regions of the Brain; how to ascertain this in a living head.

Memory, how to Develop and Improve it; its nature, quality, and uses.

The Reasoning Faculties, and the part they play in civilization, and in the great developments and duties of human life. How to judge of the size of these organs, and how to cultivate them.

The Examination of Heads Explained; practical experiments; heads examined by each of the students, who will be thoroughly trained and instructed how to make examinations, privately and publicly. Special training in the examination of skulls.

The Combination of the Organs, and their influence on character. How to ascertain what group or organs most readily combine in an individual, and how to determine his mental tendency or leading traits of character; how he may correct his errors and improve himself.

The Moral Bearings of Phrenology and a correct Physiology; home training of the young, and self-culture; Phrenology applied to education, to matrimony, to legislation, and to the choice of pursuits.

Matrimony; its laws and the proper developments of body and brain, for a true and happy union. How to determine this.

The Natural Language of the Faculties, philosophy and bearing on the reading of character as we meet people casually as strangers.

Physiognomy—Animal and Human; or "Signs of Character," as indicated in the face, form, voice, walk, expression, and so forth.

Ethnology, and how to judge of Nativity and of Race, especially how to detect infallibly the skulls of the several colored races.

Biology, Psychology, Mesmerism, Clairvoyance, etc., explained.

Resemblance to Parents, or how to determine which parent a person resembles, and what features of face, what classes of faculties, and what portions of the general build are inherited from the father, and which from the mother. A most desirable attainment for any person, especially so for the practical phrenologist.

Objections to Phrenology Considered. How the skull enlarges to give room to a growing brain; the frontal sinus; loss or injury of brain; thickness of skull; fatalism, materialism, moral responsibility.

Elocution, how to cultivate the voice. Eloquence, how to attain the art. Instruction in reading and speaking will be given by a competent and experienced teacher in oratory.

A Review of the whole, answering questions on all points relating to the subject which may be proposed by students. Each student will be carefully examined in the branches taught, and will give, in his own words, his knowledge on the subject.

How to teach Phrenology. Instruction as to the best methods of presenting Phrenology and Physiology to the public, by lectures and in classes; not only how to obtain an audience, but how to hold it and instruct it.

Dissection and Demonstration of the Human Brain, in detail, giving the students a clear view of this crowning portion of the human system.

The course will consist of ONE HUNDRED or more lessons, and it is proposed to give at the rate of three or more daily till completed; though the wishes of the class will be consulted. TERMS of the entire course of instruction for 1877, with Diploma to graduates, SEVENTY-FIVE DOLLARS.

The Works most essential to be mastered are "How to Read Character," $1.25; Phrenological bust, showing the location of all the organs, $1.00

The following are exceedingly useful to the student, and they should be read, viz., Combe's System of Phrenology, $1.50; New Physiognomy, with 1,000 illustrations, $5; Constitution of Man, $1.50; What to Do and Why, and How to Educate Each Man for his Proper Work, $2; Phrenology Proved and Applied, $1.50.

All of the above works may be obtained at the office of the PHRENOLOGICAL JOURNAL. Those who order the entire set, *to be sent at one time by express at their expense*, can have them by sending us $10. Post-office order or draft will be safe.

Apparatus for the use of Lecturers, such as portraits, skulls, and casts of heads, can be furnished to those who desire them.

Application for membership should be made at once that complete arrangements may be made. Address,

S. R. WELLS & Co., Pub'rs, 737 Broadway, New York.

All who desire it, and try for it with earnestness, will succeed Procure it now.

Deceptive Advertising.—This is the title of a strong editorial item in *The Sunday-school Times* on the subject of deceptive advertising in religious and other newspapers. The editor is especially severe in his criticism on the stand taken by the editors of religious papers in this matter, and we heartily join with him in his criticisms. When the newspapers and periodical publications in this country take the stand that has always been taken by THE PHRENOLOGICAL JOURNAL in the matter of their advertising department, their influence and their power for good will be greatly increased. Many of them now lend their columns to the most deceptive kind of advertising, especially that found in the patent medicine department. When celebrated quack doctors can advertise their nostrums in the reading-matter department, and occupying whole pages of religious newspapers whose editors know that the claims put forth by these men are falsehoods, how can they expect that evil results shall not come from the circulation of their papers, as well as good. Let the people rise in this matter. If the readers of the public press who do not believe in this way of doing business would write to the publishers of their respective papers, condemning their course, it would go a long way toward righting the matter. And if this will not do, refuse to take the papers that sell their space to advertising that which they know to be false or can not conscientiously indorse. One of the features of deceptive advertising to which the editor of *The Sunday-school Times* refers is that of the coupon system. One of these advertisements came into our columns through the want of proper criticism and care on our part; but since then we have declined hundreds of dollars worth, knowing that our readers would be deceived if they were published. We would consider it an especial favor if our readers at any time will inform us of their being imposed upon in their dealing with parties who advertise in THE PHRENOLOGICAL JOURNAL.

Oatmeal Crackers.—Nothing can be nicer than oatmeal crackers to take along on picnic excursions, if you succeed in getting a nice article. Mr. S. B. Clark, of 490 Grand Street, New York, makes some of the finest crackers we have ever tasted.

He also makes a real hygienic Graham cracker of superior excellence.

Owing to the rapid increase in his business, Mr. Clark has been compelled to enlarge his facilities, and is fitting up another building next door to his present place. We are pleased to note such evidences of prosperity at a period when most people are grumbling about "hard times."

Press Notes.—In a specific notice of the June number of THE PHRENOLOGICAL JOURNAL, the *New York South* says:

"The general contents of the present number—which contains a table of contents for the first six months of the year—are generally at once useful and interesting, and proof of the good work and good appreciation of this most useful and progressive of American monthlies."

"The JOURNAL improves as it advances in age, and is highly prized by a large number of readers."—*The Daily Eagle*, Brooklyn, N. Y.

Postage Stamps may be sent as payment for JOURNAL or Books, as they are more convenient to remit by mail, and we can use them in any business.

Benefit of an Examination.—Chicago, Ill., July 4th, 1877. S. R. WELLS & Co:—You may not remember me, but I shall never forget you nor your kind advice. About six months ago I sent you my photograph for analysis of character. I was then in a most wretched state of health, and desired your advice as to treatment. That advice and kindly encouragement has done me a great deal of good. I have continued to improve until my health may be considered firmly established. I have great faith in Phrenology, and that faith is being fortified by daily observation. L. R. M.

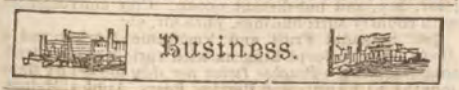
Pearl.—This bright little book is now meeting with a good sale, the first edition being nearly exhausted. It is greatly liked by all who read it, and is gaining new and increased reputation for the author of "The Self-Made Woman." It is just the thing for summer reading, and should be procured by all who have leisure and taste for light reading these sultry days. Sent by mail, post-paid, on receipt of price, 75 cents; in beautiful gilt and ink binding, $1.00. Full gilt edges. See advertisement.

Removal.—As will be seen from the address in Dr. Kidder's advertisement, he has removed his office from Fourth Avenue to 47 Lafayette Place. Dr. Kidder's apparatus is the one we offer as a premium to our agents for making up clubs to the JOURNAL. We believe it to be the most practical battery made. Price list will be sent by Dr. Kidder to any address on application.

Personal.

William H. Vanderbilt has established a library and reading-room at Albany, for the special benefit of the railroad employés.

Rev. William Aikman, D.D., author of "Life at Home," etc., was installed pastor of the Presbyterian church at Aurora, Cayuga Lake, on the evening of June 6, 1877.



Prof. James Russell Lowell has been appointed American Minister to Spain. A well-considered appointment. Prof. Lowell has been granted a leave of absence by his college, Harvard, that he may enter upon his new field of duty.

M. de Quatrefages, the celebrated anti-Darwinist, has just completed a work on the human race and presented it in the French Academy of Moral and Political Science. M. de Quatrefages admits the great influence of hereditary and natural selection, but, like Morris Wagner, he will not admit them to be the greater factors in the propagation of species.

Prince Gortchakoff, the Russian Premier, is noted for his abstemious habits. He never drinks wine and never smokes. He eats but two meals a day. Retiring very early in the evening, he sleeps ten or twelve hours. His regular habits have kept his frame in such excellent condition that he does not feel the infirmities of old age at all. He was born in 1798, entered upon his diplomatic career under Count Nesselrode, and became the Foreign Minister of Russia at the close of the Crimean campaign.

Rev. John S. C. Abbott, D.D., whose decease has been expected almost daily for many months, died at his residence at Fair Haven, Conn., on Sunday last. He was born at Farrington, Me., in 1805, and graduated at Bowdoin College in 1825 in the same class with Henry W. Longfellow, Nathaniel Hawthorne, George B. Cheever, and Jonathan Cilley. He was ordained to the ministry of the Congregational Church in 1830, was settled at Worcester, and subsequently at Roxbury and Nantucket. Dr. Abbott early devoted himself to literary labor, but his earliest published work was "The Mother at Home," which appeared in 1833. His writings comprise a variety of subjects, and were prepared mainly for the young.

Ex-Governor Noyes, of Ohio, the new Minister to France, is a native of Massachusetts, and a graduate of Dartmouth. He went to Cincinnati when young, studied law, and practiced until the outbreak of the war, when he was among the first to enlist. He was made Major of the Thirty-ninth Ohio Infantry, served under Pope, and was in the attack on New Madrid. He was also in the battles at Corinth and Parker's Cross roads, and lost a leg in the Atlanta campaign. While in the army he was elected City Solicitor of Cincinnati, and in 1865 was elected Probate Judge, and received the commission of Brevet Brigadier-General. He was elected Governor of Ohio in 1871 over G. W. M'Cook.

Notice.—The Phrenological and Publishing Business heretofore conducted by the late S. R. WELLS (formerly Fowler & Wells), will be continued by his widow, Mrs. CHARLOTTE FOWLER WELLS, under the firm name of S. R. WELLS & Co. Correspondents, Agents, and others, when communicating on business matters connected with this office, should address their letters to

S. R. WELLS & Co., 737 Broadway, N. Y.

Housework. — Wanted for general housework, in a small, plain family, near New York, one who understands hygienic cookery. A willing, intelligent, and industrious person would have a permanent place and a good home. Address, giving experience, age, terms, etc., "Housekeeper," care PHRENOLOGICAL JOURNAL, 737 Broadway, New York.

To Our English Readers.—We desire to announce to our readers and friends in the British Provinces, that we will accept as payment for our publications English or other foreign postage stamps, at the rate of 4s. 6d. for a dollar's worth, and send our books by mail, post-paid, at prices given in our announcements and lists. This will, without doubt, be a great accommodation to many, as our books are not always to be found in the local book-stores. If a book advertised at $1.50 is desired, send 6s. in postage stamps, and for other books at proportionate rates, and they will be sent by return mail.

N.B.—Send for Price-list of books. New Plan of Inducements to agents.

Hygienic Hotel,

13 & 15 Laight Street,

NEW YORK.

This well-known House is convenient of access from all parts of the city, six lines of horse-cars passing near.

The table is supplied with an abundance of the best kinds of food, *healthfully prepared*; special attention being paid to the preparation of breads, fruits, farinaceous foods, vegetables, etc.

In connection with the Hotel are Turkish Baths, Swedish-Movement Cure, Electro-Magnetic Baths, Health-Lift, etc. Circulars free. Terms reasonable.

WOOD & HOLBROOK, Proprietors.

THE

Rest Cure,

known far and wide as Our Home Hygienic Institute, Dansville, Livingston County, New York, is the largest Institution of its kind in the world, and is unequalled in America as a place for curable invalids of BOTH SEXES—no matter what their diseases—to recover good health. For over-taxed thinkers—as editors, preachers, lawyers, judges, public officials, teachers, artists, merchants, and business men of all callings and pursuits, who are weary from work, it is unsurpassed for its facilities for rest and recuperation. The best of references given and full information rendered on application FREE of cost. Address as above.

JAMES C. JACKSON.

DR. E. P. MILLER,

BATH HOTEL,

39 and 41 West 26th St., N. Y.

Cures Piles or Hemorrhoids, Fissures,

And other rectal diseases by a new process that does not require the use of the knife, ligature, or other dangerous methods. Patients under treatment generally not detained from business. This treatment cures after all other methods fail. He makes no charge for consultation or treatment unless the patient is cured. References to patients treated given. Mrs. Miller is in attendance upon ladies. Office hours: 9 to 12 A.M., and 5 to 7 P.M.

PRIVATE. For an illustrated list of all the best special medical works, designed for the private use of those who need them, send stamp. Address S. R. WELLS & CO., 737 Broadway, New York.

Healds' Hygeian Home,

Wilmington, Delaware.

Still Lower Rates! A Meat Table Added!

Knowing that we possess advantages for our work of restoring invalids to health not surpassed by any similar institution, and desiring to extend them to those whom the "hard times" have deterred from coming to us, we have again reduced our terms as follows: *Board*, $7 to $13 per week; *Board and Treatment*, $8 to $15 per week, according to rooms. Special rates for several months. No extras except Examination Fee, $5, and "Movements," $2 per week.

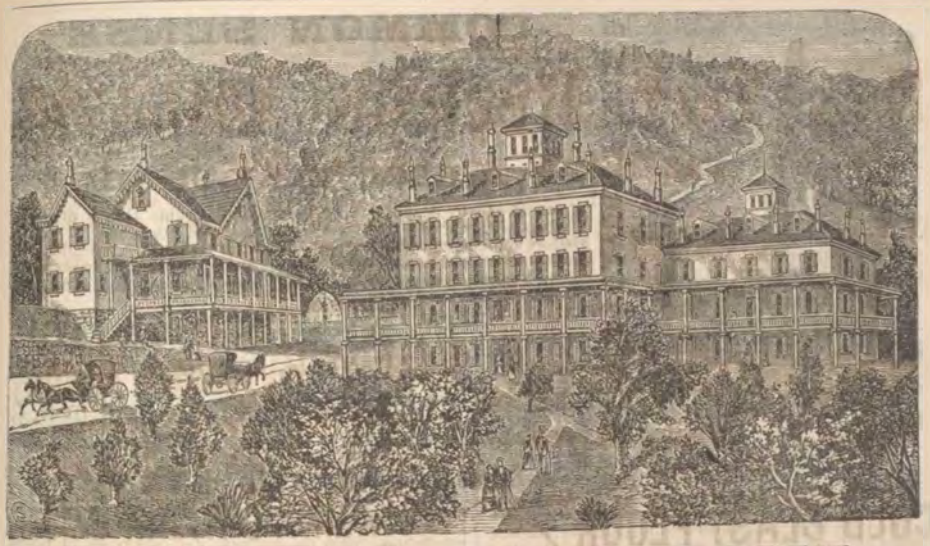
ADVANTAGES: Large, double-wall brick building, erected for our work, beautifully and healthfully located; fine grounds, extended views, adjacent groves, pleasant walks; delightful breezes in Summer from river, bay, and not-distant ocean. City conveniences with country surroundings, pure air, etc.

☞ Splendid Fruit and Vegetable Market and a *Model Garden*, furnishing us with varied, choice fresh material daily. *Peaches twice per day* for nearly three months, with cultivated Berries, Pears, Apples, Melons, Plums, Grapes, Sweet Peas, Sweet Corn, Lima Beans, Tomatoes, etc., etc., in like abundance. Meat for those who require it. In short, *the most attractive and liberal Hygienic Table* in America! (We are now canning, in glass, 1,000 half-gallon jars of fruit, etc., for Winter use).

"Swedish Movements" thoroughly and conscientiously administered—one-half hour's manipulation of each patient daily by the operator. ☞ Improved HOT-AIR and STEAM-BATH apparatus, in which the head is not exposed to the heat and impure exhalations from the body, and is kept cool by a constant gentle spray or douche. All judicious Water-Baths and Sun-Baths. Social and intellectual pleasures. Steamboat and other excursions. One hour from Philadelphia with its great "International Permanent Exhibition."

The physicians have treated several thousands of invalids successfully, without medicines, during the past seventeen years. YOUNG MEN will find in Dr. P. Heald a valuable counselor and friend, and Dr. Mary H. Heald's experience and successful treatment of *invalid women*, from nearly every State in the Union, is a guarantee that the sick will receive at her hands the medical care and sympathy they require. House heated *throughout* by steam in Winter, and *thoroughly ventilated*. Send stamp for Circular to

Drs. Pusey and Mary H. Heald.



WANTED.

MEN GO WILD

about splendid teeth. Therefore, fair ladies, it behooves you to know that **Sozodont** makes them glitter like Orient pearl. By using this pure Vegetable Dentifrice the enamel is rendered impervious to decay, all discolorations are removed, the gums become hard and rosy, and the breath rendered pure and sweet. No lady ever used **SOZODONT** without approving of its cleansing and purifying properties, and the flattering testimonials that have been bestowed upon it by eminent dentists and scientific men speak volumes of praise for its merits. **Sozodont** contains not one particle of acid or any ingredient whatever that will injure the enamel, and is free from the acrid properties of Tooth Pastes, etc. Ask your druggist for **Sozodont.** One bottle will last six months.

JUST PUBLISHED.—A NEW SUMMER BOOK.

Pearl; a Centennial Poem.

By EMMA MAY BUCKINGHAM,

Author of "A Self-Made Woman."

Fine Paper, Extra Cloth, 75 Cents. Full Gilt, $1.00.

THE PHRENOLOGICAL JOURNAL, in speaking of this book, says: "Encouraged by the success attendant upon the publication of her story of the "Trials and Triumphs of Mary Idyl," Miss Buckingham now invites attention to her recent effort in verse. Pearl Malley is the heroine, Paul Leighton the hero of the lay. Of course, as in all serial poems, the tale is one of love; but there are in 'Pearl' so many transitions of sentiment, 'from grave to gay, from lively to severe,' and all in keeping with the progress of events, that the reader is interested and pleased, in spite of himself. The poem is short, as all poems should be, and as all good poems usually are. It is language of the imagination, suggesting to the imagination of the reader many details in its course which, while necessary to a complete understanding of the story, need not be detailed. For ourselves, we like a poetic style which leaves a great deal unsaid, and is concise in what is actually related. The poetic spirit gleams in 'A Self-made Woman,' and we were not surprised when the advance sheets of 'Pearl' came to our hands. The new work is better done; the author feels more at home in tracing the measured lines, and they who welcomed the first will be glad to read this second book. There are charms of vivacity and feeling pervading many of the passages which make their reading exceedingly agreeable; in fine, the whole poem contrasts with the majority of the versifications of the day in its freedom from a trace of the monotonous and doleful. It brightens with its progress, and is happy in its close—

"And while wedding bells are chiming with delight,
Reader, I will cease my rhyming—say 'good-night.'"

The Carbondale Advance, of Carbondale, Pa., says: "The public have given gratifying evidence of their appreciation of Miss Buckingham's former work, the story of the 'Trials and Triumphs of Mary Idyl; or, a Self-made Woman." It has passed rapidly through five editions. Encouraged by this, the author has memorized the centennial year by the publication of a poem, named as above. In doing this she has avoided successfully the usual objections to poems. It is not long and dry—it is not sickly rhyme with little meaning. It is told in true poetic style, concisely and beautifully. It exhibits in animated contrast the difference between pure, genuine, and all-absorbing love, and that which is often mistaken for it, but which lacks all of its ennobling characteristics. Almost every shade of sentiment is portrayed, and the delineation shows the hand of the master. The transition and change of scene and sentiment is often rapid and somewhat unexpected, but always life-like and in keeping with the progress of events. It is full of interest from the beginning to the end, and enchains the attention of the reader. The effect of its perusal upon the mind and the heart can but be salutary. The publishers have issued it in their best style, making it an acceptable ornament upon the parlor table."

The Wayne Co. (Pa.) *Herald* says: "While Miss Brownscombe is making Wayne Co. a reputation in art circles, Miss Emma May Buckingham is doing us a like service in the department of literature. She has supplemented her successful prose tale, 'A Self-Made Woman,' with a pretty poetical romance entitled 'Pearl'—a work which promises to prove the brightest jewel in her crown of authorship."

The book is well printed on beautiful paper, silk finish cloth binding, ink and gilt stamps. Copies sent by mail, post-paid, on receipt of price. Plain, 75 cents; full gilt, $1.00. Address

LAURIE & McCLATCHEY'S HOMŒOPATHIC DOMESTIC MEDICINE.

EIGHTH EDITION.

BOERICKE & TAFEL, New York and Philadelphia.

1,044 pp., large 8vo, Half morocco, Price $5.

This is the most complete and comprehensive work on the subject in the English language. It gives a concise description of diseases and their Homœopathic treatment. Of the original work of Dr. Laurie **21,000** copies are in circulation in England. Dr. McClatchey added the indigenous American Remedies, and thus brought it up to date. Of this improved American edition, the **Eighth** has just been issued within six years, which fact speaks volumes in its favor. Send stamp for descriptive Price Current of this and other books. Address BOERICKE & TAFEL, HOMŒOPATHIC PHARMACY, 145 Grand Sreet, New York. Business established in 1835.

HOW TO TEACH.

THE NEW TESTAMENT,

IN GREEK AND ENGLISH,

ENTITLED

THE EMPHATIC DIAGLOTT,

Containing the Original Greek Text of THE NEW TESTAMENT, with an Interlineary Word-for word English Translation; a New Emphatic Version based on the Interlineary Translation, on the Readings of Eminent Critics, and on the various Readings of the Vatican Manuscript (No. 1,209 in the Vatican Library); together with Illustrative and Explanatory Foot Notes, and a copious Selection of References; to the whole of which is added a valuable Alphabetical Index. By BENJAMIN WILSON. One vol., 12mo, pp. 884. Price, $4; extra fine binding, $5. Sent by first post, on receipt of price, by SAMUEL R. WELLS, & CO. 737 BROADWAY, NEW YORK.

This valuable work is now complete. The different renderings of various passages in the New Testament are the foundations on which most of the sects of Christians have been built up. Without claiming absolute correctness for our author's new and elaborate version, we present his work so that each reader may judge for himself whether the words there literally translated are so arranged in the common version as to express the exact meaning of the New Testament writers. In regard to MR. WILSON'S translation there will doubtless be differences of opinion among Greek scholars, but having submitted it to several for examination, their verdict has been so generally in its favor that we have had no hesitation in presenting it to the public. We have no desire for sectarian controversy, and believe that it is consequent chiefly upon misinterpretation, or upon variations in the formal presentation of the truths of *Christianity* as taught in the New Testament; and it is with the earnest desire that what appears crooked shall be made straight, that we present this volume to the careful consideration of an intelligent people.

OPINIONS OF THE CLERGY.

The following extracts from letters received by the publishers from some of our most eminent divines will go far to show in what light the new "Emphatic Diaglott" is regarded by the clergy in general:

From THOMAS ARMITAGE, D.D., *Pastor of the Fifth Avenue Baptist Church*,—"GENTLEMEN: I have examined with much care and great interest the specimen sheets sent me of 'The Emphatic Diaglott.' * * * I believe that the book furnishes evidences of purposed faithfulness, more than usual scholarship, and remarkable literary industry. It can not fail to be an important help to those who wish to become better acquainted with the revealed will of God. For these reasons I wish the enterprise of publishing the work great success."

From REV. JAMES L. HODGE. *Pastor of the First Mariners' Baptist Church, N. Y.*—"I have examined these sheets which you design to be a specimen of the work, and have to confess myself much pleased with the arrangement and ability of Mr. Wilson. * * * I can most cordially thank Mr. Wilson for his noble work, and you, gentlemen, for your Christian enterprise in bringing the work before the public. I believe the work will do good, and aid in the better understanding of the New Testament."

From the REV. DR. DOWLING, *New York, Author of the "History of Romanism,"* etc.—"GENTLEMEN: I have examined the specimen sheets of 'The Emphatic Diaglott.' While I should hardly venture to express an opinion of the character of the translation from so brief a portion, I am free to say that I think the literal interlinear version will be of great assistance to all learners of the Greek language, especially to those who wish to study without the aid of a teacher. The brief and accurate 'History of the Greek Text,' and also of the 'English Versions,' and the valuable explanatory notes at the foot of the page, will increase the value and utility of the work to all students of the Word of God."

From PROF. H. MATTISON, *Pastor of Trinity M. E. Church, Jersey City, N. J.*—* * * "The plan of the work is admirable, and the presence of the Greek text and interlinear version gives every scholar a fair chance to test the version for himself, verse by verse and word for word. I can not but believe that the work will be a valuable acquisition to the Biblical literature of the country."

From A. A. LIVERMORE, D. D., *President of the Theological School, Meadeville, Pa.*—* * * "I welcome all efforts intelligently made to popularize the results of criticism, and wish that this little volume might be possessed by every clergyman and student of the Scriptures in the country."

From REV. C. LAREW, *Pastor of the Halsey Street M. E. Church, Newark, N. J.*—"'The Diaglott' has given me great pleasure. The arrangement is a most excellent one, and the new version can not fail to be of great gratification and profit, especially to those unacquainted with the original Greek. The translator has certainly shown great genius in seizing upon the thought of the original, and a happy tact in presenting it.

From REV. G. F. WARREN, *Pastor of the Worthern Street Church, Lowell, Mass.*—* * * "Am highly gratified with the plan of the translation, and the thorough manner in which he (the author) has done his work. If I mistake not, this translation will receive a cordial welcome from the Christian public. It is just what every Christian needs. I congratulate myself and others that such a valuable auxiliary to the study of the Word of God is placed in our hands."

From SAMUEL OSGOOD, D. D., *New York City.*—"I have looked over the specimen of the new and curious edition of the New Testament which you propose publishing, and think that it will be a valuable addition to our Christian literature. It is a work of great labor and careful study, and without being sure of agreeing with the author in all his views, I can commend his book to all lovers of Biblical research."

From JOHN QUINCY ADAMS, D. D., *Pastor of the Antioch Church, Bleecker Street, N. Y.*—* * * "Having been engaged for the last eight or nine years in giving instruction to young men preparing for the ministry, in the Greek, I feel that your work will be a valuable auxiliary in this direction, as the interlinear translation will greatly aid the beginner. The foot notes will also be very valuable to those who have not had the opportunity of securing from other sources the facts and explanations which they supply."

From REV. O. B. FROTHINGHAM, *New York City.*—"The specimen you have sent me of a new edition of the New Testament has interested me very much. The plan is new, and is better calculated than any I have ever seen to give the public a notion of the way in which the translation was made from the Greek."

Criticisms have also been received from the following distinguished clergymen, who have perused advance sheets: DR. S. H. TYNG, New York; REV. DR. E. E. ADAMS, Philadelphia; REV. DR. D. R. GOODWIN, Philadelphia; REV. DR. J. H. A. BOMBERGER, Philadelphia, and many others.

That the work has real merits, none will question. That it will be approved by all, we can not hope, for "there are many men of many minds." But on our own knowledge and on such testimonials as the above we rest. The book, which is a handy, handsome volume, will speak for itself. Clergymen, Students, and others need it.

For sale by all Booksellers, and sent by mail post-paid by S. R. WELLS & CO., 737 BROADWAY, N. YORK.

CLUB RATES, FOR GOOD BOOKS.

MAKE UP CLUBS FOR

THE INDISPENSABLE HAND-BOOK.

HOW TO WRITE—HOW TO TALK—HOW TO BEHAVE—AND HOW TO DO BUSINESS.

COMPLETE IN ONE LARGE ELEGANT VOLUME.

THIS fine work—in four parts—embraces just the practical matter-of-fact information which every one—old and young—ought to have. It will aid in attaining, if it does not insure, "success in life." It contains some 600 pages, elegantly bound, and is divided into four parts.

How to Write.

AS a MANUAL OF LETTER-WRITING AND COMPOSITION, *it is far superior* to the common "Letter-Writers." It teaches the inexperienced how to write Business Letters, Family Letters, Friendly Letters, Love Letters, Notes and Cards, and Newspaper Articles, and how to Correct Proof for the Press. The newspapers and magazines have pronounced it simply "Indispensable."

How to Talk.

NO OTHER BOOK CONTAINS SO MUCH USEFUL INSTRUCTION on the subject as this. It teaches how to Speak Correctly, Clearly, Fluently, Forcibly, Eloquently, and Effectively, in the Shop, the Drawing-room, etc. A Chairman's Guide, to conduct Debating Societies and Public Meetings. How to Spell and how to Pronounce all sorts of Words; with Exercises for Declamation. The chapter on "Errors Corrected" is worth the price of the volume to every young man. How to Talk is, indeed, "Worth a dozen grammars."

How to Behave.

THIS IS A MANUAL OF ETIQUETTE, *and it is believed to be the best "MANNERS BOOK"* ever written. If you desire to know what good manners require, at Home, on the Street, at a Party, at Church, at Table, in Conversation, at Places of Amusement, in Traveling, in the Company of Ladies, in Courtship, this book will inform you. It is a standard American work on Good Behavior.

How to Do Business.

INDISPENSABLE IN THE COUNTING-ROOM, IN THE STORE, IN THE SHOP, ON THE FARM, for the Clerk, the Apprentice, the Book Agent, and for Business Men. It teaches how to Choose a Pursuit, and how to follow it with success. It receives the lad as a Cash Boy; puts him through a Clerkship; behind the Counter; in the Counting-Room, and fits him for Partner and Principal, as a Banker, a Merchant, a Broker, Publisher, or other pursuits. "It teaches how to get rich honestly," and how to use riches wisely.

How to Write—How to Talk—How to Behave, and How to Do Business, bound in one large handsome Volume, $2.25.

IT is believed that there was never a book published which has met with a more appreciative and universal demand than this one has. It is in consideration of the fact, that so many copies are wanted in the same vicinity, that we have been induced to offer the book—which all need, and every one, old and young, male and female, ought to have—at the following very

LIBERAL CLUB OR WHOLESALE RATES.

GREAT REDUCTION IN PRICE.

THE PHRENOLOGICAL BUST.

Believing a wider circulation of the Phrenological Busts will tend to awaken an interest in the subject, we have arranged for improved and greatly increased facilities for the manufacture of them, and are prepared to supply them at one-half their former price, making the large size $1.00 by express instead of $2.00; and the small one 50 cents by mail, post-paid, instead of $1.00. These prices place them within the reach of all, and every reader of THE PHRENOLOGICAL JOURNAL should have one. This Bust is made of plaster of Paris, properly lettered, so as to show the latest classification and exact location of all the Organs of the Brain. It is divided so as to show each individual Organ on one side; all the groups—Social, Executive, Intellectual, and Moral—properly classified, on the other side. Each Bust is accompanied with a Key, giving the proper definition of the organs. Besides being useful, these Busts are highly ornamental. They will be sent on receipt of price, the large size $1.00 by express; the small size 50 cents by mail. Agents wanted. Address

S. R. WELLS & CO., Publishers, 737 Broadway, New York.

Phrenology at Home.

THE STUDENT'S SET.

In response to the demand for a series of works which would meet the want of one who was desirous of obtaining a good knowledge of the philosophy and practical application of Phrenology at Home, a selection of the best works has been made, and the set is offered at reduced prices, so as to bring the collection within the means of nearly everybody.

The following are the titles with the customary prices of each work:

A System of Phrenology. By George Combe. **$1.50.**

New Physiognomy; or, Signs of Character. $5.

How to Read Character. A Hand-Book. **$1.25.**

Constitution of Man. By George Combe. **$1.50.**

Phrenology Proved, Illustrated, and Applied. $1.50.

What to Do and Why. $2.

The Phrenological Bust. Large size **$1.**

As indispensable to a proper knowledge of the location of the different organs upon the head, the large Phrenological Bust is included.

The price of this list amounts to $13.75, but will be supplied by express together, on receipt of **$10**

HOW TO READ

CHARACTER:

A NEW ILLUSTRATED Hand-Book of PHRENOLOGY and PHYSIOGNOMY, for the use of Students and Examiners; with a Descriptive Chart for marking, and upwards of 170 Engravings. Price, post-paid, in muslin, $1.25; in paper, $1.

One who wishes to get a practical knowledge of Phrenology and Physiognomy in the shortest possible time, and without burdening his mind with theoretical speculations, will find this just the work he needs. It begins at the beginning; describes the brain and the skull; illustrates the temperaments; shows how the organs are grouped together in the cranium; points out the location and function of each organ, with the corresponding physiognomical signs; gives practical direction for the cultivation or restraint, as may be necessary, of each organ; explains fully the "Art of Character Reading," showing how to proceed in an examination, how to find the organs, how to distinguish temperaments and other physiological conditions.

The work is thorough, methodical, carefully considered in every part; and at the same time simple, concise, popular in style, and adapted to the comprehension of all. It does not claim to be exhaustive, but we can confidently assert that so much truly useful matter on the subject treated, with so many fine illustrations, can nowhere else be found in the same compass or for so small a price

For sale by all booksellers and sent by mail, post paid by S. R. WELLS. & CO. 737 BROADWAY, N. Y.

S. R. WELLS & CO., Publishers, 737 Broadway, New York.

Publishers' Department.

The business affairs pertaining to the publication and circulation of this Journal, and other miscellaneous and current matter, with advertisements, in general, are inserted in this department.

ANNOUNCEMENT.

The next number of this magazine will contain the portraits of the Rev. Joseph Cook, of Boston, and Hon. John Sherman, Secretary of the U. S. Treasury, with sketches and biographical notes; also interesting chapters of Peacemaker Grange; a letter in reply to the inquiries of "A Son in College;" The Structure and Care of the Teeth; Chapters VI. and VII. of Light in Dark Places; Further Recollections of a Practical Phrenologist, etc., etc.

An Author's Testimonial.—One of our correspondents, a lady well known to the readers of society magazines for her cheery, instructive talk on household topics, says of the PHRENOLOGICAL: "It improves yearly and is a PEARL among magazines. There is a poor man in Landoff, a terrible sufferer from scrofulous troubles, to whom I have lent bundles of the JOURNAL, and when he returned them he said: 'I tell you, Miss ——, that's a fust rate magazine, for it teaches you lots of things; and when I am in pain I lie down, and take one o' them books and it does me a great deal of good.' The old lawyer, Sq. P——, about whom I have told you, is now 84 years old, who always reads my magazines with great pleasure, says: 'THE JOURNAL is worth all the other magazines published.'"

A Bequest for the Institute.—We are informed by Mrs. E. P. Gause, a late student, and now lecturer and examiner, that Mrs. P. A. Perkins, of Pikeville, North Carolina, who died in June last, remembered the Phrenological Institute in her will, providing that the sum of two hundred dollars be paid into its treasury upon the settlement of her estate. The lady had but a few years before become interested in the work of the Institute, but had sufficiently examined it to appreciate the expediency of giving to it all the material support in her power. The trustees take this method of publishing their acknowledgment for help which is much needed in carrying on the educational department of the Institute.

Thankful.—A very grateful letter comes from an inmate of the Missouri Penitentiary, a too intelligent man, by his language and handwriting, to be a convict, yet he is one. He writes in acknowledgment of copies of the PHRENOLOGICAL, says that we alone of several publishers in New York to whom he appealed for mental pabulum, responded, some being "too poor," and others who send out religious matter being "too holy," he supposes, to consider the want of a criminal. Would that we had the ability to supply every public institution of the sort in the land with our publications.

PRESS OPINIONS.

"We have always looked upon the PHRENOLOGICAL JOURNAL as a work of great importance. In its special department—the reading of character by the development and comparison of heads—it has commanded the very highest respect. But the JOURNAL goes beyond Phrenology—its mission is more useful and extended. It deals with matter of a miscellaneous nature, especially with affairs pertaining to health."—*British Whig* (Canada).

"The table of contents embraces a number of very important subjects, with a variety which can not fail to both please and profit all. This is one of the freshest, brightest, and most readable of our American magazines."—*Central Methodist.*

"'Man, Know Thyself,' is the motto of this popular and widely-known magazine, and well does it fill its mission in giving to the general reader, in monthly installments, sufficient mental pabulum for wholesome digestion. As a guide and instructor in its line of literature it stands at the forefront, and those who fail to profit by its teachings and advice, must attribute it to their own carelessness, as many gems of knowledge are hidden in its pages for their extraction."—*Printers' Circular* (Philadelphia).

"While its title and aim is to place Phrenology as an established science before the people, it presents articles in a practical way on all important subjects where it can promote intelligence, virtue, and happiness. When one with a vigorous mind, thoroughly devoted to intellectual and physical improvement, becomes well acquainted with the JOURNAL, it becomes a necessary mentor in the future experience of every-day life."—*Prattsburgh News* (N. Y).

"Its table of contents contains a more varied and practicable list of subjects, presented in a cultivated and intelligent style, than any other magazine that comes to us. It is useful and instructive to all classes of both sexes. Its pages in the May number, under the head 'Agricultural Hints' and 'Recipes,' is worth to the farmer and housewife a year's subscription alone. But the most important department is that wherein the 'Science of Health' is treated. Do our sick readers desire to regain their health? Do our well readers desire to keep well? Then we can not do them a greater service than to advise the attentive perusal of the columns of this valuable periodical."—*Wine Dealers' Gazette* (N. Y).

"THE PHRENOLOGICAL JOURNAL.—'Excelsior' appears to be the motto of both editors and publishers of this valuable periodical. We seldom take it up without liking it better, and never without learning something really useful. There is not a more useful journal published than the PHRENOLOGICAL, nor one more ably edited."—*New York Trade Reporter.*

The Emphatic Diaglott, containing the Original Greek Text of what is commonly styled the New Testament (according to the recension of Dr. J. J. Griesbach), with an interlineary word-for-word English translation. A new emphatic version, based on the interlineary translation, on the renderings of eminent critics, and on the various readings of the Vatican Manuscript, together with illustrative and explanatory foot notes and a copious selection of references, to the whole of which is added a valuable Alphabetical Appendix. By Benjamin Wilson. Published by S. R. WELLS & Co., New York. Price in cloth, $4; in extra binding, $5.

It is difficult to overestimate the value of this truly excellent work. As above stated, each Greek word has its own proper English synonym immediately under it, and thus the reader, without being a Greek scholar, can tolerably well see for himself the meaning of the original text. In addition to this the author occupies one-third of each page with a new translation, which in many particulars is most excellent. So much have we been interested in this part of the work, that we have gone through the whole of it, reading the old chapters of Scripture with a freshness that was truly surprising.

The alphabetical appendix is most complete. It comprises geographical and proper names, weights, measures, coins, precious stones, apostolic words and phrases, etc., contained in the books of the New Testament. The appendix covers nearly fifty closely-packed pages, and with type new and clear.

Says the author in his preface: "It is generally admitted by all critics that the authorized or common version of Scriptures absolutely needs revision. Obsolete words, uncouth phrases, bad grammar and punctuation, etc., all require alteration. But this is not all. There are errors of a more serious nature which need correction. The translators of the common version were circumscribed and trammelled by royal mandate; they were required to retain certain old ecclesiastical words, which were accordingly left untranslated. Thus the minds of many who had no means of knowing the meaning of the original words have been misled and confused. Biblical criticism, however, during the last two hundred years, has done much to open up and elucidate the word of God by discovering many things which were unknown to the old translators, making great improvements in the text," etc.

Taking the work as a whole we think it is invaluable to ministers, students, Sunday-school teachers, and all who would know more fully the beauties of the inspired volume.—*The Paragon.*

Book Premiums—Our book premium offers, which were extended to the first of September, will at that time be positively withdrawn, so that to secure the Premium Book, names must be sent in at once.

A Great Distribution.—We would call special attention to the advertisement headed as above, on another page. Our readers should take advantage of this opportunity.

A Rare Chance.—The attention of our readers is directed to the advertisement headed "A Premium for Everybody," on another page.

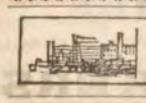
Died—Parish.—At Bloomingville, O., Wednesday morning, August 1, 1877, at four o'clock, Julia Parish, wife of William E. Parish, and stepdaughter of Prof. O. S. Fowler, formerly of New York City.

How to Paint.—*The Farmer's Magazine* says: "This is one of the most valuable and practical books we have had the pleasure of reading in a good while. A book that is calculated to be of great use and convenience to every householder of moderate means. One of the great problems with the great masses of the people at the present day is: 'how shall we, on our reduced income, keep up the beauty and attractiveness of our homes?' This book, by showing how much of the work of improving and ornamenting a home may be done at home, and at a small cost, does a great deal toward solving this problem. Written, as it is, by a practical painter, and a man of great experience, it possesses a value that could never belong to the work of a mere theorist. Moreover, it is written, not for the practical painter, but for the man who does not understand the art nor its technical terms. It puts into the hands of its readers the means of improving and beautifying their homes at a small cost, and with results at least nearly as satisfactory as if a professional painter had been employed.

Among the great variety of subjects that we find treated of in a plain, practical, comprehensible manner are: First, a general introduction concerning the material and tools required, general information concerning the usual cost of most work, directions for mixing and using Paints, preparing Putty, Milk Paint, Distemper Painting; directions for mixing and applying Kalsomine, Paint for fences, and out-buildings; Whitewashing, Paper-hanging, Graining and Staining, Imitation of wood or stone, Gilding, Transferring, Polishing, Waxing and Varnishing furniture, cleaning paint, cleaning marble, painting a farm wagon, revarnishing a carriage, making plaster casts, and other ornamental household work."

Personal.

Thomas Hughes calls attention to the fact that but for the woman who became his wife when he was an enthusiastic young man panting for adventure, Charles Kingsley would have come to America in the summer of 1839, and that when Kingsley looked across the Mississippi at Council Bluffs from Omaha, the eastern terminus of the Pacific Railway, the tears came to his eyes as he thanked God for his wife, and thought what might have been.



Friederich August Gottren Tholuck, for fifty years Professor of Oriental Literature in the University of Halle, Germany, died in that city on the 3d inst., at the age of seventy-seven. He was one of the first theologians of Europe, and an able writer.

Jared Whitman, of South Abington, Massachusetts, is the oldest living graduate of Brown University. He is of the class of 1806, and is ninety-two years old.

Mr. Bancroft, the historian, is a graduate of the class of 1817, of Harvard. Seventeen of his associates survive after 60 years out of college. Caleb Cushing, and Mayor Greene, of Cambridge, belonged to this class—the most remarkable for longevity in the catalogue. Fourteen dined together at the last commencement whose average age was 79.

Lord Stratford De Redcliffe, now eighty-nine, formerly for many years British Ambassador at Constantinople, has published an article on Turkey, in a late number of the *Nineteenth Century*.

Wm. Fullerton, a lawyer of New York, raises five tons of hay to the acre on the devastated and hoof-trampled soil of Southern Virginia.

Business.

Notice.—The Phrenological and Publishing Business heretofore conducted by the late S. R. WELLS (formerly Fowler & Wells), will be continued by his widow, Mrs. CHARLOTTE FOWLER WELLS, under the firm name of S. R. WELLS & Co. Correspondents, Agents, and others, when communicating on business matters connected with this office, should address their letters to

S. R. WELLS & Co., 737 Broadway, N. Y.

Housework.—Wanted for general housework, in a small, plain family, near New York, one who understands hygienic cookery. A willing, intelligent, and industrious person would have a permanent place and a good home. Address, giving experience, age, terms, etc., "Housekeeper," care PHRENOLOGICAL JOURNAL, 737 Broadway, New York.

To Our English Readers.—We desire to announce to our readers and friends in the British Provinces, that we will accept as payment for our publications English or other foreign postage stamps, at the rate of 4s. 6d. for a dollar's worth, and send our books by mail, post-paid, at prices given in our announcements and lists. This will, without doubt, be a great accommodation to many, as our books are not always to be found in the local book-stores. If a book advertised at $1.50 is desired, send 6s. in postage stamps, and for other books at proportionate rates, and they will be sent by return mail.

Saratoga Springs.—Drs. Strongs' Remedial Institute has Turkish, Russian, Sulphur, Hydropathic and Electrical Baths, Vacuum Treatment, Inhalation of Oxygen, Compressed and Rarefied Air, Health-Lift, etc., for the treatment of Nervous, Lung, Female, and other Chronic Diseases.

Situation Wanted, as Book-keeper, by a middle-aged man, a thorough and accomplished accountant. The question of salary to be settled when employer is satisfied as to ability, etc. Address "Book-keeper," care PHRENOLOGICAL JOURNAL, 737 Broadway, New York.

Two Farms for Sale.—Two large Dairy Farms, very productive, situated on the Harlem Railroad, distance, respectively, 47 and 88 miles from New York City. The annual income from each from $3,000 to $4,000. Terms easy. Address S. R. WELLS & Co., 737 Broadway, for full particulars.

A Good Book on Health.—One which should be read by all. DIGESTION AND DYSPEPSIA explains the philosophy of Digestion and causes of Dyspepsia, with directions for treatment. Not medical, but hygienic, and popular. Price $1, post-paid. Address S. R. WELLS & Co., Publishers, 737 Broadway, New York.

Business Cards.

Still Lower Rates! A Meat Table Added!

Knowing that we possess advantages for our work of restoring invalids to health not surpassed by any similar institution, and desiring to extend them to those whom the "hard times" have deterred from coming to us, we have again reduced our terms as follows: *Board*, $7 to $13 per week; *Board and Treatment*, $8 to $15 per week, according to rooms. Special rates for several months. No extras except Examination Fee, $5, and "Movements," $2 per week.

ADVANTAGES: Large, double-wall brick building, erected for our work, beautifully and healthfully located; fine grounds, extended views, adjacent groves, pleasant walks; delightful breezes in Summer from river, bay, and not-distant ocean. City conveniences with country surroundings, pure air, etc.

☞ Splendid Fruit and Vegetable Market and a *Model Garden*, furnishing us with varied, choice fresh material daily. *Peaches twice per day* for nearly three months, with cultivated Berries, Pears, Apples, Melons, Plums, Grapes, Sweet Peas, Sweet Corn, Lima Beans, Tomatoes, etc., etc., in like abundance. Meat for those who require it. In short, *the most attractive and liberal Hygienic Table* in America! (We are now canning, in glass, 1,000 half-gallon jars of fruit, etc., for Winter use).

"Swedish Movements" thoroughly and conscientiously administered—one-half hour's manipulation of each patient daily by the operator. ☞ Improved HOT-AIR and STEAM-BATH apparatus, in which the head is not exposed to the heat and impure exhalations from the body, and is kept cool by a constant gentle spray or douche. All judicious Water-Baths and Sun-Baths. Social and intellectual pleasures. Steamboat and other excursions. One hour from Philadelphia with its great "International Permanent Exhibition."

The physicians have treated several thousands of invalids successfully, without medicines, during the past seventeen years. YOUNG MEN will find in Dr. P. Heald a valuable counselor and friend, and Dr. Mary H. Heald's experience and successful treatment of *invalid women*, from nearly every State in the Union, is a guarantee that the sick will receive at her hands the medical care and sympathy they require. House heated *throughout* by steam in Winter, and *thoroughly ventilated*. Send stamp for Circular to

DR. E. P. MILLER,

BATH HOTEL,

39 and 41 West 26th St., N. Y.

Cures Piles or Hemorrhoids, Fissures,

And other rectal diseases by a new process that does not require the use of the knife, ligature, or other dangerous methods. Patients under treatment generally not detained from business. This treatment cures after all other methods fail. He makes no charge for consultation or treatment unless the patient is cured. References to patients treated given. Mrs. Miller is in attendance upon ladies. Office hours: 9 to 12 A.M., and 5 to 7 P.M.

HOW TO TEACH.

This new and useful book is now meeting with a wide circulation, both by its sale, in the usual channels of trade, and as a Premium Book to subscribers to the JOURNAL. In this way an opportunity is offered by which all may procure it at once, and without cost. See List and send orders at once. Address S. R. WELLS & CO., PUBLISHERS, 737 BROADWAY, NEW YORK.

A Great Distribution.

When our two Magazines where consolidated, we had left on hand a large number of odd copies, not needed to complete sets for binding, of

The Science of Health.

The matter contained in these numbers is most of it as fresh and timely as when first published, and, therefore, too valuable to be allowed to take its course to the old paper stock. We propose to distribute these among our readers at but little more than the cost of postage, and the trouble of sending away by mail, as follows:

We will send ten different numbers selected from our stock of surplus copies, by mail, post-paid, to any address for 50 cents. This would be equal to a 12mo volume of nearly 1,000 pages, and in no other way can so much reading-matter concerning health be procured for so small an outlay. Those who have THE SCIENCE OF HEALTH should procure these numbers and loan them. We will also send ten different numbers of the PHRENOLOGICAL JOURNAL for $1.00.

All in want of cheap reading-matter, and those who would have numbers to lend to those who need them, or who might become interested, have here a chance to supply themselves. Address all orders to

S. R. WELLS & CO., Publishers,
737 Broadway, New York.

THE MOUNTAIN HOME.

"A GREAT CURE."

Isaac Jones, Esq., of Philadelphia, was brought to the "Mountain Home" suffering with severe *inflammation of the bowels*, and in seven days Dr. A. Smith restored him to his usual good health. Invalids should read our circular. Address

A. SMITH, M.D., or
Mrs. C. C. SMITH, M.D.,
"Mountain Home," Wernersville, Berks County, Pa.

A PPEMIUM FOR EVERYBODY.

OTHER PEOPLE'S CHILDREN,

The sequel to **HELEN'S BABIES,**

Now Ready, continues the narrative of the droll doings of "BUDGE" and "TODDIE." It contains a complete account of the management of "HELEN'S BABIES," by a lady who knew just how the children of other people should be trained. Of "HELEN'S BABIES" 250,000 copies have been sold, and everyone, of course, who has read that inimitable work will want to read "OTHER PEOPLE'S CHILDREN," which is fully as good. Those who don't like children and those who do, those who have babies of their own and those who haven't, should procure a copy of "OTHER PEOPLE'S CHILDREN," and read about "Budge" and "Toddie," the sauciest imps who ever bothered a bachelor uncle or worried an amiable aunt. Price, by mail, postpaid, **60 cts.** or on conditions stated below it will be GIVEN to *every new* subscriber to The **HOUSEKEEPER'S COMPANION.** An elegantly ILLUSTRATED twelve-page monthly, printed on fine, tinted paper, and devoted to everything that pertains to the HOUSEHOLD, and its *economical management*, including SCIENTIFIC and HEALTHFUL COOKERY, HOME DECORATIONS, FANCY WORK, the cultivation of FLOWERS, etc. The best and cheapest household paper published. *No lady should keep house without it.* To anyone remitting 60 cents, and 10 cents extra for postage, or **70 cts** altogether, we will send THE HOUSEKEEPER'S COMPANION for A YEAR, and a copy of "OTHER PEOPLE'S CHILDREN," described above. Here is a chance to procure the most delightful book of the season and a first-class monthly for the price of the *book alone and postage.* Those who desire "HELEN'S BABIES," can have it on the same terms as "OTHER PEOPLE'S CHILDREN." Send in your order AT ONCE, if you would avail yourself of this offer, as it will not appear again in this paper. Address all orders to **M. T. Richardson, Publisher, 29 Fulton Street, Brooklyn, N. Y.** Postage Stamps taken when it is not convenient to send Currency. ☞ *In ordering state in what paper you saw this advertisement.*

THE INQUIRER

is a first-class family paper, which treats all Religious, Social, Political, and Literary questions, and all questions of general interest which come within its scope, in a positive manner, but in a broad and catholic spirit.

It numbers among its contributors many men of wide reputation as thinkers and writers, and day by day is extending its list. Those wanting a thoughtful, scholarly weekly, would do well to send for sample copies.

The Inquirer

is published every Thursday from the middle of September to the middle of July each year. It has an old and valuable constituency, and an increasing circulation in families and among business and professional men, reading-rooms and libraries throughout the country.

Subscription Price, - $3 per annum in advance.
" " to Clergymen $2 per annum in advance.
Postage, 20 cents per annum in advance.

The constituency of THE INQUIRER is such as to render it a valuable advertising medium, and its rates have been adapted to the conditions of the times. They are as follows, payable in advance:

Six cents per line per week, without choice of position; outside page and page next reading matter, **ten** cents per line.

Special Notices **twenty** cents per line.

DISCOUNT.

Five per cent. on monthly insertions.

Ten per cent. on quarterly insertions.

One-third off on yearly advertisements.

Copy for Thursday's paper received until Tuesday afternoon.

Advertisements must be acceptable in every respect.

OFFICE,

STATION D, NEW YORK.

An Important and Valuable Work.

DIGESTION AND DYSPEPSIA,

a Complete Explanation of the Physiology of the Digestive Processes, with the Symptoms and Treatment of Dyspepsia and other Disorders of the Digestive Organs. Illustrated. By R. T. TRALL, M.D. Bound in Muslin. Price $1.00.

THE AUTHOR SAYS IN HIS PREFACE:

This work, now offered to the public, is a Summary of the data which I have been collecting for more than a quarter of a century, with regard to the nature, causes, complications, and proper treatment of the diseases of the digestive organs: and an experience of more than thirty years, during which time I have had the professional management of several thousands of invalids (besides hundreds which I have treated through correspondence), a large proportion of whom were dyspeptics, has convinced me that the theories advanced and the practice recommended in this volume, are true and successful. I have only to add, that I have not in any case administered medicine, but have relied exclusively on Hygienic agencies as remedial resources.

The following, from the Table of Contents, will show something of the nature and scope of this work:

Part I.—Digestion.—Nutrition, Insalivation, The Teeth, Deglutition, Chymification, Chylification, Intestinal Digestion, Absorption of the Nutrient Elements, Aeration of the Food Elements.

Part II.—Dyspepsia.—Nature of Dyspepsia, Special Causes of Dyspepsia, Symptoms of Dyspepsia, Dyspepsia and Cachexies, Principles of Treatment, Food, Drink, Exercise, Bathing, Clothing, Sleep, Ventilation, Light, Temperature, Mental Influences, Occupation, Tobacco-Using, Tight Lacing, Position and Malposition.

It tells you *what to eat* and *how to eat it; what to do* and *how to do it;* not what medicine to take and how to take it, to cure Dyspepsia.

WHAT THE PAPERS SAY OF DIGESTION AND DYSPEPSIA.

"Dr. Trall, the author, has for years enjoyed a wide reputation as a writer upon Hygiene as well as upon health topics generally. He is a clear, forcible, and thoroughly informed writer."—*Inter-Ocean.*

"The invalid will find valuable hygienic hints in this volume."—*Cincinnati Daily Gazette.*

"The book contains much valuable information and sound advice."—*Chicago Advance.*

"Accurate information on health and dietetics is a public necessity, and we have here a fresh contribution to the voluminous literature on the subject."—*Scientific American.*

"This treatise on dyspepsia and the attendant digestive disorders, bears the impress of thoroughness and simplicity, and it would seem not ill adapted for a school text-book."—*Golden Age.*

"The author talks in a straightforward, sensible manner on these subjects, divested of all medical technicalities."—*Western Rural.*

"We have read it carefully, and earnestly recommend it to the perusal of every one. How to avoid dyspepsia, if you have it not, or how to cure it if you have it; and that, too, by the simplest means within the reach of all, is information that we hail as the harbinger of a new era wherein dwelleth knowledge."—*Portsmouth Chronicle.*

"Better buy such works than gallon after gallon of medicine."—*Church Advocate.*

"Would prove of immense value to thousands of sufferers from this terrible disease."—*Huntingdon* (Pa.) *Journal.*

"A work of great value to the victims of dyspepsia, as well as to the general public, and will be found invaluable in every family where the laws of health are properly regarded."—*Vermonter.*

"An exceedingly useful little volume to all."—*Historical Magazine.*

Sent by mail, post-paid, to any address, on receipt of price, $1.00.

LIFE AT HOME; or, The Family and its Members

Including Husbands and Wives, Parents, Children, Brothers, Sisters, Employers and Employed, the Altar in the House, etc. By Rev WILLIAM AIKMAN, D.D. 1 vol. 12mo. Nearly 300 pp., tinted paper fancy muslin, beveled boards. Price, $1.50; extra gilt, $2.

It is seldom a book is published which receives such universal commendation from the press—religious and secular—and from all denominations, as this. We trust the following brief extracts will be sufficient to indicate the spirit of the whole.

NOTICES OF THE PRESS.

While we earnestly recommend it to every Christian household, we wish to say that preachers may here find themselves led into suggestive trains of thought and reflection on a class of subjects concerning which the pulpit is entirely too reticent.—*Christian Standard*

Upon the many books on this all-important theme, this is a great advance. The author's aim and effort are alike admirable.—*Christian World.*

An admirable book. We would have a copy in every house.—*New York Observer.*

This is a book full of hearty good sense. Every husband who reads it will be a better husband, and every wife will draw from it strength to make home more pleasant, and domestic life a still higher enjoyment.—*Prairie Farmer.*

A beautiful spirit of Christian love and tenderness pervades the whole work, and none, we think, can read it without being better for the perusal.—*New York Times.*

Dr. Aikman has done society and the family especially, good service in the preparation of this timely volume. A strong common-sense pervades the whole book.—*Providence Press.*

We hope it will secure a large circulation.—*Phila. City Item.*

The views of Dr. Aikman are sound and true, clearly stated, and eloquently enforced.—*Phila. Age.*

An interesting and valuable work.—*Temperance Patriot.*

Dr. Aikman has here given us a wholesome and substantial treatise on the character and essentials of a home in its highest and best sense, as God designed it. The book is one that will well repay perusal.—*American Baptist.*

The subject of family life is handled with sound sense and good feeling, and the result is a book attractive in manner as well as in matter.—*Atlas, N. Y.*

We heartily commend it, satisfied that the benefits derived from it will richly repay every reader.—*Boston Nation.*

The views are sensible, though not commonplace, and at times the language rises to a genuine eloquence.—*Rochester Democrat.*

This is a very delightful book, and ought to be read by every husband, wife, parent, and child.—*American Artizan.*

Very pleasing, and at the same time logical. The volume is replete with good and practical advice to husbands and wives, parents and children, brothers and sisters.—*Phila. Inquirer.*

Offers many useful suggestions for making the fireside happy.—*Cin. Gazette.*

Not only to be exceedingly interesting, but eminently instructive.—*Evening Bulletin, Balto.*

There are some beautiful and impressive thoughts to be found on these pages, which will do much good wherever they make their way among reflective readers.—*Banner of Light.*

We think that every one, young and old, and no matter of what persuasion, can derive from the book both pleasure and profit.—*Sunday Democrat.*

It contains many golden thoughts, and well uttered, will do good in families.—*Presbyterian.*

"Life at Home" is an eminently sensible and practicable talk about the family and its relations, and how to keep them pure and pleasant. A sensible and useful book, and one which, we trust, will find many to read, to ponder, and to give heed to its suggestions.—*Brooklyn Union.*

Full of excellent and valuable instruction.—*Express.*

We commend it heartily as a timely book, whose careful reading by fathers, mothers, brothers, and sisters, cannot fail of good.—*Christian Radical.*

Every chapter is full of most excellent advice. We believe that no one can read the book without great profit.—*New Jerusalem Messenger.*

A very thoughtful and excellent practical work.—*The Independent.*

It is well written, and worthy of a wide circulation.—*Herald and Presbyter.*

A most welcome addition to our Home works. It is a beautifully got up work, and is full of matter calculated to improve, instruct, and entertain.—*Buffalo Post.*

This charming volume of Dr. Aikman's will do a great service wherever it reaches. We desire for it a large circulation, and we recommend our readers to purchase it, and read it carefully.—*Irish Republic.*

Its suggestions are not barren generalities, but full of point and practicalness.—*American Literary Gazette.*

The suggestions, if accepted, would make happier every family in the land.—*Ecclesiastical Gazette.*

It cannot but be a good antidote to the loose views regarding marriage and the family relation, which seem almost to be the fashion in certain quarters just now.—*Pittsburgh Leader.*

It is a book that cannot but do good into whatever hands it may fall, and should have a wide circulation.—*Newark Advertiser.*

It is to be hoped that the family and its members will profit by his suggestions.—*Bath Gazette.*

An excellent and affectionate practical treatise upon the family.—*The Congregationalist.*

An earnest plea for the family, its rights and duties.—*Tablet.*

We can but wish that it could be read and heeded by all.—*Albany Evening Journal.*

A true course of life is pointed out to each member of the family, which, if followed, would prove to one and all a heaven on earth. We recommend it to clergymen, teachers, and others, as every way suitable for a present and a keepsake.—*Providence Herald.*

This is a very excellent and timely book, one that should be read by parents and children alike.—*Scientific American.*

The contents are of the most interesting and important character.—*Church Messenger.*

The book cannot fail to prove beneficial wherever read, and we readily commend it to our readers.—*Chronicle and Sentinel, Augusta, Ga.*

Dr. Aikman's book is full of sensible suggestions, the general adoption of which would add immensely to the happiness of society and the promotion of all that is noble and good among men.—*Phila. S. S. Times.*

His cautions and suggestions concerning the various home relations are clear-sighted, sagacious, and rational, and equally impress the conscience and convict the judgment.—*Chicago Post.*

Dr. Aikman writes clearly, pointedly, with just feeling and good sense, and with a happy faculty of hitting the nail on the head.—*Boston Commonwealth.*

Every way the book deserves a place in every family and its reading would do good.—*Christian Instructor*

Satisfied of its real excellence—its great utility and far-reaching influence, we heartily commend the book to one and all. Handsomely published, it is at once a worthy present, suited to the centre-table—and most inviting to the reader. Agents may do well with it. Sent, post-paid, on receipt of price, by **S. R. WELLS & CO., 737 Broadway, New York.**

Publishers' Department.

The business affairs pertaining to the publication and circulation of this Journal, and other miscellaneous and current matter, with advertisements, in general, are inserted in this department.

IMPORTANT ANNOUNCEMENT.

PRICE REDUCED.—After careful consideration and consultations with our friends, it has been deemed best to reduce the price of THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH from the present subscription price of $3 a year to $2 a year. Our great desire is to see a knowledge of Phrenology so extended, that all shall know of its truths and their application to the affairs of life; and believing this can be best accomplished by a more extended circulation of the JOURNAL, we wish to place it within the easy reach of all. With the reduction in price must, of course, come somewhat of a reduction in size; but this will not be in proportion to the reduced price, as the larger the circulation the less expensive it is for publication. With a hundred thousand readers we could maintain the JOURNAL at or nearly its present size at $2 a year; but until this number of subscribers is obtained, we must "cut our garment according to the cloth." The quality of the JOURNAL will in every respect be fully maintained. Many of our friends have frequently urged on us the importance of making this reduction in price, promising that if this was done they could meet with much better success in obtaining subscribers. Now we shall look for the evidence of their wisdom in the form of many new names being sent in by old readers. Those who have failed to interest others on account of the old price of the JOURNAL should make an effort now, as it certainly can not be made an objection. Let every old reader make a strong effort to send, with his own subscription, the name of at least one new subscriber.

As a special inducement to new subscribers, we are offering the last three months of this year free to those whose names are sent in at once.

SUBSCRIBERS' OPINIONS.

"GENTLEMEN:—I have been a careful reader of THE PHRENOLOGICAL JOURNAL for the last seven or eight years, and every new number is looked for with eager anticipation. I am happy to say that the JOURNAL grows better every year. W. T. S., Coopersville, Mich."

"I consider THE PHRENOLOGICAL JOURNAL one of the best in existence and indispensably valuable to me. E. H., Nocomis, Ill."

"I regard THE PHRENOLOGICAL JOURNAL as the best friend a young man can have; his surest guide to success if he will only mind its teachings. R. T., New Garden, Mo."

Double Postage. — Now that the fractional currency has been so largely withdrawn from circulation, our friends find it difficult to make remittances; frequently enclosing coin, pennies, and nickels to such an extent as to make postage double, which we frequently have to pay. This will be entirely avoided by sending postage stamps, which will be altogether satisfactory to us, as we use large quantities of them daily in our extensive mailing department. Whenever currency can not be obtained readily, or even small bills, the amount may be sent in postage stamps of any denomination less than twenty-five cents.

Three Months Free.—As announced on another page, the last three months of this year are offered free to new subscribers for 1878 whose names are sent in at once. Therefore, now is the time to subscribe for 1878. Will not our subscribers take an interest in making known the particulars of this offer?

A Trial Trip.—We have reduced the price of THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH, in order that we may give to the magazine a more universal and widespread circulation, and we are confident that this will be accomplished in this way. In addition to this, we propose to give every reader in the land an opportunity of becoming acquainted with the JOURNAL, without subscribing for a year, by offering it to new subscribers ON TRIAL for three months for the low price of twenty-five cents. This amount will pay for the JOURNAL for the months of October, November, and December. This is offering the three numbers in the three-dollar form for the low price of twenty-five cents, and it can not be that any person who may become aware of this offer will not feel disposed to take advantage of it. This is less than cost, and, of course, our hope is for renewals, which we are confident of receiving where persons will read a few specimen numbers of the JOURNAL. Agents should take immediate advantage of this opportunity to introduce the JOURNAL to new readers, that they may at the end of the TRIAL TRIP secure renewals at regular rates. Those who believe in THE PHRENOLOGICAL JOURNAL and its teachings, should be willing to make an effort—to inconvenience themselves somewhat, if need be—in order to see that everybody has the opportunity of taking advantage of this offer.

Fifty Thousand Wanted.—We want fifty thousand new "TRIAL-TRIP" subscribers to THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH for the next three months, and, if the proper efforts are put forth by our agents and our present readers, this will be accomplished, and it will result in a largely-increased list of subscribers for 1878. Will not every reader make an effort to send at least one dollar's worth of trial trip subscribers? Your friends will thank you for it, and we will thank you for it.

Prospectuses for 1878.—Our new prospectus for 1878 is now ready for distribution, and we solicit the interest of our present readers in giving this a wide circulation among their friends. Now that the price of the JOURNAL has been reduced, this should be made known by the distribution of circulars, that all may have an opportunity of subscribing. Persons connected with post-offices, stores, shops, mills, etc., have facilities for distributing these prospectuses, and if our friends will let us know how many of them can be used to advantage, they will be supplied at once by mail, post-paid. Now is the time to work for an increased circulation.

Our Premium-List for 1878.—On another page will be found our list of premiums for 1878. We have made a few changes, and some additions to the list may be made before the close of the year. The reduced price of the JOURNAL will render the making up of clubs much more easy than it often has been before, and our agent-friends, who have been successful in the past, should now work with renewed interest. Look over our list carefully, and no argument will be needed to convince you that our offers are more liberal than those usually made by other pubishers. It will pay every reader of the JOURNAL to make the endeavor necessary to the forming of a club, especially where there is not a large club already organized.

Important to Agents.—This number of the JOURNAL must begin with our agent-friends a new campaign, and this should be opened up earnestly and vigorously. No time should be lost, but agents should commence at once. To facilitate their efforts, the last three months of this year are offered FREE to new subscribers for 1878. This will be found a popular inducement, as subscribers will date their subscriptions with the year, and at the same time begin to receive their magazines at once, and is, of course, equivalent to a reduction of 25 per cent.; for fifteen numbers will be received instead of twelve, and the extra numbers are in the three-dollar form instead of the two-dollar. These numbers as a premium will be found more popular than cheap chromos or some article of fancy goods. Our new circular to agents has been mailed to those on our list. If any have failed to receive this, or if other readers are interested in receiving it, application should be made at once, and copies will be sent.

Wanted.—Our agent-friends are scattered in all parts of the country, and they have done a noble work for THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH; but there is room for more, and in many neighborhoods in which there is not now a club for the JOURNAL, one might readily be formed by a little well-directed effort. What has been done in one place can be done in another, and the fact that we have large clubs in some places simply proves that agents can do well in other towns. We do not ask our friends to workfor nothing, fully believing that the laborer is worthy of his hire. Our terms are liberal, and our premium offers beyond comparison. Will not our present agent-friends and interested readers of the JOURNAL take an interest in extending our agencies, and see that there is a wide-awake, active person acting as agent in every neighborhood? Our premium list and other particulars will be sent on application.

Need of Good Literature.—One of our Western correspondents, in the course of a recent letter, makes allusion to the widespread ignorance of the people with regard to the common matters of duty, and adds: "But there are a few of us who are convinced that it is of more importance to understand and obey the natural laws of our being than to sing hallelujahs, while we bring ourselves through ignorance to an untimely end in hopes of a blessed immortality;" and also intimates a wish to "scatter literature that will set the people to thinking, and eventually cause them to act." Of course, we cordially agree with him.

Gems of Goldsmith is an elegant little volume of poems. It contains "The Traveler," "The Deserted Village," "The Hermit," and a biographical sketch of Goldsmith. These poems have long since taken rank among the classics of English literature and entered the very soul of humanity. None probably have been so universally read and none are more worthy to be read. "The Traveler" has been pronounced one of the first poems in the English language. "The Deserted Village" teems with tender and pathetic sentiment and touches of the finest humor; with high moral feeling; with noble and effective imagery; with portraitures of character that exhibit the conception of a genius and the hand of a master. This book is beautifully bound, well illustrated, and full gilt.—*York Co.* (Me.) *Independent.*

Heart Echoes (by Helen A. Manville).—This little volume contains a choice collection of poems which will afford all true lovers of poetry a rich feast of simple, plaintive melodies. This author's writings remind us of the Misses Cary, and all the readers of this paper must be familiar with their writings. We quote the following:

"Idler in the field of Life,
Is there nothing you can do?
When Sin cuts such mighty swathes
Is there no work left for you?
Up, I pray, and act your part
Bravely on Life's busy stage,
That your record, when 'tis done,
Bear no blot on any page."

There are upwards of a hundred poems in this book on various subjects suited to the wants of the readers. —*York Co.* (Me.) *Independent.*

Order your Clothing from New York.—For many years Mr. Geo. L. Burr, merchant clothier, of No. 140 Fulton Street, New York, has made the filling of orders from the country a special feature of his business. People in all parts of the United States, and even in Canada, have sent to him for suits with the most satisfactory results. His system of self-measure is so perfect that a misfit is well-nigh impossible. Besides having your clothing made up in the latest style and of the best material, there is a positive gain in dollars and cents by sending your orders to Mr. Burr. To every reader of the JOURNAL desiring to investigate the merits of his system who will mention where they saw his advertisement, he will send, *free*, his Book of Fashions, together with samples of goods and Rules for Self-Measure.

The Sunday-School Times.—A recent number of the *Sunday-School Times* announces that a change has taken place in its proprietorship; Mr. John Wanamaker, who has been connected with it for some time and pushed it with his money and energy, withdraws, leaving it in the hands of Mr. Trumbell and Mr. Wattlers, his associates. The *Times* is a good paper for the class for whom it is published and should have a wide circulation.

Given Away.—Read the offer of Mr. M. T. Richardson in another column, of a pretty pencil case to every three months' subscriber to his weekly 'IDLE HOURS."

Personal.

Mrs. Van Cott, the well-known revival preacher, has almost lost her voice, but is still conducting services.

Rebecca Anderson, of Seneca Falls, New York, is said to be one hundred and twelve years of age. She is so old, that it is over twenty-five years since a census-taker has had the pluck to ask her how old she is.

Governor Hartranft, it is said, while at the head of the troops in Pittsburgh preserving the peace, "wore a faded hickory shirt, and was without coat or vest."

Mr. Xenophon Munn, of Stowe, Vermont, who is fond of alliteration, has seven daughters, named Luceba, Lucretia, Lurana, Lucinda, Lucia, Lula, and Luna, and three sons, named Charles, Carroll, and Clarence.

Mr. Lewis Brooks died at Rochester on the 9th of August. A very benevolent man, he assisted many worthy undertakings in so quiet a manner, that it has only now come out that his benefactions amounted to more than $200,000.

Modeste Malhiot, of Quebec, aged sixty-eight, six feet, eight inches high, and weighing 618 pounds, died a few days ago; as did also Ruth Benton, of Wisconsin, aged fifty-four, seven feet, four inches high, and pulled down the beam at 585 pounds.

William B. Ogden, a prominent railroad man, and the first Mayor of Chicago, died on Friday at his residence, the Villa Boscobel, near High Bridge, in this city, in the seventy-third year of his age. By his business enterprise and sagacity in developing the West, he has been known as the "Pioneer of the North-west."

Business.

Notice.—The Phrenological and Publishing Business heretofore conducted by the late S. R. WELLS (formerly Fowler & Wells), will be continued by his widow, Mrs. CHARLOTTE FOWLER WELLS, under the firm name of S. R. WELLS & Co. Correspondents, Agents, and others, when communicating on business matters connected with this office, should address their letters to

S. R. WELLS & Co., 737 Broadway, N. Y.

Housework.—Wanted for general housework, in a small, plain family, near New York, one who understands hygienic cookery. A willing, intelligent, and industrious person would have a permanent place and a good home. Address, giving experience, age, terms, etc., "Housekeeper," care PHRENOLOGICAL JOURNAL, 737 Broadway, New York.

To Our English Readers.—We desire to announce to our readers and friends in the British Provinces, that we will accept as payment for our publications English or other foreign postage stamps, at the rate of 4s. 6d. for a dollar's worth, and send our books by mail, post-paid, at prices given in our announcements and lists. This will, without doubt, be a great accommodation to many, as our books are not always to be found in the local book-stores. If a book advertised at $1.50 is desired, send 6s. in postage stamps, and for other books at proportionate rates, and they will be sent by return mail.

Saratoga Springs.—Drs. Strongs' Remedial Institute has Turkish, Russian, Sulphur, Hydropathic and Electrical Baths, Vacuum Treatment, Inhalation of Oxygen, Compressed and Rarefied Air, Health-Lift, etc., for the treatment of Nervous, Lung, Female, and other Chronic Diseases.

Situation Wanted, as Book-keeper, by a middle-aged man, a thorough and accomplished accountant. The question of salary to be settled when employer is satisfied as to ability, etc. Address "Book-keeper," care PHRENOLOGICAL JOURNAL, 737 Broadway, New York.

Two Farms for Sale.—Two large Dairy Farms, very productive, situated on the Harlem Railroad, distance, respectively, 47 and 88 miles from New York City. The annual income from each from $3,000 to $4,000. Terms easy. Address S. R. WELLS & Co., 737 Broadway, for full particulars.

A Good Book on Health.—One which should be read by all. DIGESTION AND DYSPEPSIA explains the philosophy of Digestion and causes of Dyspepsia, with directions for treatment. Not medical, but hygienic, and popular. Price $1, post-paid. Address S. R. WELLS & Co., Publishers, 737 Broadway, New York.

BUSINESS CARDS.

Trall's Hygeian Home and Hygeio-Therapeutic College, Florence Hights, N. J. NEW YORK HYGIENIC INSTITUTE, 102 East 22d Street. R. T. Trall, M.D., and Rebecca L. Trall, M.D., Physicians.

Wm. White, M.D., author of Medical Electricity, Office, 143 W. 45th Street, gives treatment and instruction. Write for particulars.

Drs. S. W. & Mary Dodds, Hygeian Home, 2826 Washington Avenue, St. Louis, Mo. Send for circular.

Dr. Lyon's Hygeian Home at Springfield, Mo.

Healds' Hygeian Home,

Wilmington, Delaware.

Still Lower Rates! A Meat Table Added!

Knowing that we possess advantages for our work of restoring invalids to health not surpassed by any similar institution, and desiring to extend them to those whom the "hard times" have deterred from coming to us, we have again reduced our terms as follows: *Board*, $7 to $13 per week; *Board and Treatment*, $ to $15 per week, according to rooms. Special rates for several months. No extras except Examination Fee, $5, and "Movements," $2 per week.

ADVANTAGES: Large, double-wall brick building, erected for our work, beautifully and healthfully located; fine grounds, extended views, adjacent groves, pleasant walks; delightful breezes in summer from river, bay, and not-distant ocean. City conveniences with country surroundings, pure air, etc.

☞ Splendid Fruit and Vegetable Market and a *Model Garden*, furnishing us with varied, choice fresh material daily. *Peaches twice per day* for nearly three months, with cultivated Berries, Pears, Apples, Melons, Plums, Grapes, Sweet Peas, Sweet Corn, Lima Beans, Tomatoes, etc., etc., in like abundance. Meat for those who require it. In short, *the most attractive and liberal Hygienic Table* in America! (We are now canning, in glass, 1,000 half-gallon jars of fruit, etc., for Winter use).

"Swedish Movements" thoroughly and conscientiously administered—one-half hour's manipulation of each patient daily by the operator. ☞ Improved HOT-AIR and STEAM-BATH apparatus, in which the head is not exposed to the heat and impure exhalations from the body, and is kept cool by a constant gentle spray or douche. All judicious Water-Baths and Sun-Baths. Social and intellectual pleasures. Steamboat and other excursions. One hour from Philadelphia with its great "International Permanent Exhibition."

The physicians have treated several thousands of invalids successfully, without medicines, during the past seventeen years. YOUNG MEN will find in Dr. P. Heald a valuable counselor and friend, and Dr. Mary H. Heald's experience and successful treatment of *invalid women*, from nearly every State in the Union, is a guarantee that the sick will receive at her hands the medical care and sympathy they require. House heated *throughout* by steam in Winter, and *thoroughly ventilated*. Send stamp for Circular to

BATH HOTEL,

39 and 41 West 26th St., N. Y.

Cures Piles or Hemorrhoids, Fissures,

And other rectal diseases by a new process that does not require the use of the knife, ligature, or other dangerous methods. Patients under treatment generally not detained from business. This treatment cures after all other methods fail. He makes no charge for consultation or treatment unless the patient is cured. References to patients treated given. Mrs. Miller is in attendance upon ladies. Office hours: 9 to 12 A.M., and 5 to 7 P.M.

LAURIE & McCLATCHEY'S

HOMŒOPATHIC

DOMESTIC MEDICINE.

EIGHTH EDITION.

BOERICKE & TAFEL, New York and Philadelphia. 1,044 pp., large 8vo. Half morocco. Price $5.

This is the most complete and comprehensive work on the subject in the English language. It gives a concise description of diseases and their Homœopathic treatment. Of the original work of Dr. Laurie **21,000** copies are in circulation in England. Dr. McClatchey added the indigenous American Remedies, and thus brought it up to date. Of this improved American edition, the **Eighth** has just been issued within six years, which fact speaks volumes in its favor. Send stamp for descriptive Price Current of this and other books. Address BOERICKE & TAFEL, HOMŒOPATHIC PHARMACY, 145 Grand Sreet, New York. Business established in 1835.

Opposite the Astor Library.

DRS. WALTER'S MOUNTAIN HOME,

WERNERSVILLE, BERKS CO., PA.

A new and first-class Health Institute, modern in all its appointments, built by the Drs. Walter for the purpose of Illustrating in practice the principles of the NUTRITIVE CURE. Its opening season has been a noteworthy success—so much so as to justify the claim of superiority in all important particulars. In the following respects we can unreservedly commend it as being surpassed by none on the continent:

Healthfulness of Location, Beauty of Scenery, Equableness and Mildness of Climate, Purity of Air, Purity and Softness of Water, Ease of Access, the Convenience of its Arrangements, and Thoroughness and Accuracy of its Management.

Its physicians are educated and of long experience in the practice of the True Healing Art. They are ambitious to excel, energetic in effort, positive in management, and earnestly devoted to their work. Sixteen years of observation and practice, extending over the whole range of hygienic appliances, has enabled us to employ:

1st. The **WATER-CURE** in moderation, avoiding its excesses while retaining its valuable features.

2d. The **MOVEMENT-CURE.** This Institution is the fountain-head of Hygienic Movement-Cure, *administered as an essential part of the treatment, and in all cases free of extra charge.*

3d. **SUN-BATHS.** So, too, we have led the van in the application of Sun-baths. For ten years we have been earnest investigators into this mode of treatment, and our SUN-BATH and BLUE-LIGHT rooms are models of excellence.

4th. The **DIET-CURE.** Good food and plenty of it, and such as is suited to the needs of the individual, expresses our ideas of diet. We believe in neither starving nor stuffing, but seek the golden mean between the extremes.

5th. The **REST-CURE.** We have one of the most restful places in the world, and great attention is paid to securing rest and sleep to the invalid. Ours is not a Summer-resort, where noise and confusion and excitement torment the invalid.

6th. **ELECTRICITY** and **MAGNETISM** are used as special remedial appliances when necessary.

7th. The **SOCIAL, RELIGIOUS,** and **MORAL INFLUENCES** are relied upon as important curatives (see notice of NUTRITIVE CURE on another page).

Wanted, 25,000 Persons

To send at once to THE PHRENOLOGICAL CABINET, 737 BROADWAY, subscription for a "Trial Trip" to **The Phrenological Journal and Science of Health,** which is offered for the next three months for 25 cents. This is the most fascinating and interesting, as well as the most practical and useful Magazine for general circulation published. It deals with humanity. Needs only to be read to be appreciated, and here is a chance to try it almost without cost. The retail price of these three numbers is 90 cents, but as above for 25 cents.

The Phrenological Cabinet

At 737 BROADWAY (Astor Place), has been established for nearly half a century (Fowler & Wells), and contains a vast collection of Crania and Specimens, including Human and Animal Skulls, Casts, Busts, Portraits, etc., representing every shade of humanity, from the highest to the lowest type. This collection is now on Free Exhibition, and can not fail to be a place of interest to citizens and strangers. The rooms are cool, well ventilated, and pleasant—well supplied with seats and comforts for visitors. In connection with the Cabinet are Private Rooms for Phrenological Examinations, when desired.

S. R. WELLS & CO. (successors to FOWLER & WELLS),

737 BROADWAY, NEW YORK.

A Great Distribution.

When our two Magazines where consolidated, we had left on hand a large number of odd copies, not needed to complete sets for binding, of

The Science of Health.

The matter contained in these numbers is most of it as fresh and timely as when first published, and, therefore, too valuable to be allowed to take its course to the old paper stock. We propose to distribute these among our readers at but little more than the cost of postage, and the trouble of sending away by mail, as follows:

We will send ten different numbers selected from our stock of surplus copies, by mail, post-paid, to any address for 50 cents. This would be equal to a 12mo volume of nearly 1,000 pages, and in no other way can so much reading-matter concerning health be procured for so small an outlay. Those who have THE SCIENCE OF HEALTH should procure these numbers and loan them. We will also send ten different numbers of the PHRENOLOGICAL JOURNAL for $1.00.

All in want of cheap reading-matter, and those who would have numbers to lend to those who need them, or who might become interested, have here a chance to supply themselves. Address all orders to

S. R. WELLS & CO., Publishers,

REDUCTION IN PRICE.

A New Edition

OF THE

FAMILY PHYSICIAN

A ready prescriber and Hygienic adviser, with reference to the Nature, Causes, Prevention, and Hygienic Treatment of Diseases, Accidents and Casualties of every kind. By JOEL SHEW, M.D., author of "Children, their Diseases and Management;" "Diseases of Women," etc. Illustrated with nearly three hundred Engravings. Price, $3.00.

A new edition of this valuable work has been published as a large 12mo, and the price reduced from $4.00 to $3.00, bound in extra muslin. The work has not been abridged, and contains over eight hundred octavo pages, and nearly three hundred pertinent and appropriate illustrations, showing plainly the various subjects treated of, and enabling the unprofessional reader to understand the construction of his physical organization. As will be seen from the table of contents given in the following pages, it covers the whole ground of human existence, from birth to old age, with all the conditions, diseases, and accidents to which the system is subject. The remedies recommended are Hygienic, and directions are given for HOME TREATMENT, which will enable the reader to avoid the necessity of calling a physician in the majority of cases. Besides, the

Laws of Life and Health

are made so plain as to enable one to avoid sickness and infirmities which come from a violation of the conditions of Health. Many testimonials have been received from the press, and those who have been benefited by following its teachings. Below are found a few of these

FAVORABLE NOTICES.

It possesses the most practical utility of any of the author's works, and is well adapted to give the reader an accurate idea of the organization and functions of the human frame.—*New York Tribune.*

The work is admirably simple, clear, and full, and no popular work that we ever saw had half its claims to notice. We hope it may have a wide circulation. Its mission is a most important one. It lies at the foundation of all other missions of reform. Let the world be informed in regard to the laws of health, and every other reform will have its way cleared. Till then, every effort for moral and intellectual improvement can be only partially and feebly effective.—*Boston Ledger.*

Without the fear of our family physician before our eyes, we say that this is a very good book to have in families. It contains much valuable instruction in the art of preserving and restoring health, which every man of common sense, who understands anything about the human frame, will see at once is, and must be, sound and reliable. It might, almost any day, be the means of saving a valuable life. We are honestly of the conviction that every household in the land would lessen its complaints and doctor's bills, if they would read it and follow its suggestions.—*Boston Congregationalist.*

The different cases upon which it treats number over *nine hundred*, in each of which the symptoms, the cause, and the *manner of treatment are given in full.*—*Clinton Tribune.*

There is not a subject relating to health but what it treats upon, in an able manner.—*Howard Gazette.*

Its 816 pages abound with thousands of facts and suggestions of the *highest importance to all.*—*Christian Inquirer.*

It is the best work of the kind we have ever seen upon the subject, and ought to *be in every family.*—*Advertiser.*

It is very elaborate, and is one of the very best of medical works. Every family should have a copy.—*Star of the West.*

It is worth its weight in gold.—*Ellsworth Herald.*

It is a very able and excellent work, and one which we can heartily recommend to every family; it is every thing that its name purports to be.—*Scientific American.*

It is a very comprehensive, valuable work, and can not fail to exert a salutary effect upon the public mind.—*Baltimore Sun.*

We have no hesitancy in pronouncing it *a very useful book*, and one which should be in the possession of *every family.*—*Beaver Dam Republican.*

Familiarity with its contents will save many dollars' worth of drugs, and avert many weary days and months of sickness.—*Musical World.*

The work embodies *a vast amount* of information in regard to the structure and diseases of the human frame, which will be read with profit.—*New England Farmer.*

Not only are diseases described, and the appropriate treatment pointed out, but numerous examples are given, which can not fail to interest the reader, and prove a *very acceptable family directory.*—*Boston Traveler.*

It is exceedingly comprehensive, and well illustrated. It contains a great deal of information and sound advice, which every reader, whatever his views on medicine, would consider valuable.—*New York Courier.*

A complete encyclopedia of every disease to which the human family is heir, *with the cure for each disease.*—*Day Book.*

The author has brought together a mass of information in reference to the human structure, its growth and its treatment, which will render his work of great use to readers *of all classes and conditions.*—*Philadelphia Daily Times.*

An Important and Valuable Work.

DIGESTION AND DYSPEPSIA,

a Complete Explanation of the Physiology of the Digestive Processes, with the Symptoms and Treatment of Dyspepsia and other Disorders of the Digestive Organs. Illustrated. By R. T. TRALL, M.D. Bound in Muslin. Price $1.00.

THE AUTHOR SAYS IN HIS PREFACE:

This work, now offered to the public, is a Summary of the data which I have been collecting for more than a quarter of a century, with regard to the nature, causes, complications, and proper treatment of the diseases of the digestive organs: and an experience of more than thirty years, during which time I have had the professional management of several thousands of invalids (besides hundreds which I have treated through correspondence), a large proportion of whom were dyspeptics, has convinced me that the theories advanced and the practice recommended in this volume, are true and successful. I have only to add, that I have not in any case administered medicine, but have relied exclusively on Hygienic agencies as remedial resources.

The following, from the Table of Contents, will show something of the nature and scope of this work:

Part I.—Digestion.—Nutrition, Insalivation, The Teeth, Deglutition, Chymification, Chylification, Intestinal Digestion, Absorption of the Nutrient Elements, Aeration of the Food Elements.

Part II.—Dyspepsia.—Nature of Dyspepsia, Special Causes of Dyspepsia, Symptoms of Dyspepsia, Dyspepsia and Cachexies, Principles of Treatment, Food, Drink, Exercise, Bathing, Clothing, Sleep, Ventilation, Light, Temperature, Mental Influences, Occupation, Tobacco-Using, Tight Lacing, Position and Malposition.

It tells you *what to eat* and *how to eat it; what to do* and *how to do it;* not what medicine to take and how to take it, to cure Dyspepsia.

WHAT THE PAPERS SAY OF DIGESTION AND DYSPEPSIA.

"Dr. Trall, the author, has for years enjoyed a wide reputation as a writer upon Hygiene as well as upon health topics generally. He is a clear, forcible, and thoroughly informed writer."—*Inter-Ocean.*

"The invalid will find valuable hygienic hints in this volume."—*Cincinnati Daily Gazette.*

"The book contains much valuable information and sound advice."—*Chicago Advance.*

"Accurate information on health and dietetics is a public necessity, and we have here a fresh contribution to the voluminous literature on the subject."—*Scientific American.*

"This treatise on dyspepsia and the attendant digestive disorders, bears the impress of thoroughness and simplicity, and it would seem not ill adapted for a school text-book."—*Golden Age.*

"The author talks in a straightforward, sensible manner on these subjects, divested of all medical technicalities."—*Western Rural.*

"We have read it carefully, and earnestly recommend it to the perusal of every one. How to avoid dyspepsia, if you have it not, or how to cure it if you have it; and that, too, by the simplest means within the reach of all, is information that we hail as the harbinger of a new era wherein dwelleth knowledge."—*Portsmouth Chronicle.*

"Better buy such works than gallon after gallon of medicine."—*Church Advocate.*

"Would prove of immense value to thousands of sufferers from this terrible disease."—*Huntingdon* (Pa.) *Journal.*

"A work of great value to the victims of dyspepsia as well as to the general public, and will be found invaluable in every family where the laws of health are properly regarded."—*Vermonter.*

"An exceedingly useful little volume to all."—*Historical Magazine.*

Sent by mail, post-paid, to any address, on receipt of price, $1.00.

34	An Eight-Day Clock, "Victoria,"	8 00	7

Send in names as fast as received, stating they are on premium account, and all will be placed to your credit, and Premium sent when the number is complete. Send 20 cents as postage on Specimens, Prospectuses, Posters, Blanks, etc., to use in canvassing. Names may be sent from different post-offices if desired. Remit P. O. Orders, or in Registered Letters.

Address **S. R. Wells & Co., Publishers, 737 Broadway, N. Y.**

Publishers' Department.

The business affairs pertaining to the publication and circulation of this Journal, and other miscellaneous and current matter, with advertisements, in general, are inserted in this department.

ANNOUNCEMENT.

Our next number, the December, will contain a sketch with portrait of Dr. Russell T. Trall, late deceased; a sketch of Dr. Noah Porter, President of Yale College; an illustrated article on Colored People; The Electric Pen; besides The Scientific Aspects of Phrenology; The Pacific Northwest; additional chapters of "Light in Dark Places;" "Ancient Cookery," etc., etc.

Canvass Now.—Our agent-friends and those interested in the JOURNAL should embrace the present time for canvassing. Leave prospectuses and show your specimen numbers, and urge on the people the value and importance of THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH. You must certainly meet with success. This is a favorable time, because people have not yet subscribed for the reading-matter for 1878. And, also, because we are now offering the last three months of this year to new subscribers. Our premium offers are such as will enable all certainly to make it pay.

Our Premiums.—We do not ask our friends to work for the circulation of THE PHRENOLOGICAL JOURNAL without compensation, although many write that they are fully compensated from the knowledge of the fact that good must come from the increased circulation of the JOURNAL; but believing that "the laborer is worthy of his hire," we offer a commission to those who send us names; and, as a further compensation, we offer to use this commission for our friends by purchasing for them here, with the money, such articles as they may desire, giving to them the advantage of such reductions in price as we may obtain in consideration of the quantity of goods taken and the advertising we give. We call special attention to the list of our premium offers, believing that it will be found that no publisher has before made offers which are more liberal to the agent; besides, each person will find something in the premium list which will be found useful and desirable. A descriptive list will be sent to all who may apply for it as soon as it is ready.

Silver-Ware Premiums.—The attention of our readers is called to our offer of elegant silver ware on another page. The goods we offer from the manufactory of Reed & Barton are, in every respect, first-class; they are not washed and called plated, like so much "silver-ware" that has been advertised and placed before the people within the last few months. It is all of standard plate. With the JOURNAL at the reduced price of $2.00 per year, every person who is in need of silver-ware of any kind should be able to readily make up a club of the desired number of subscribers. These are necessities and do not come under the head of luxuries.

Reading.—Let us take time for reading. It will never come if we wait to have every speck of dirt we see removed from every article. We can always find something else to do, and conscientious housekeepers with little taste for mental pursuits, are apt to make great blunders. "The life is more than meat, and the body more than raiment," which means that you yourself, with all your immortal faculties, are of vastly more importance than your household affairs. No kind of labor is degrading if done from a worthy motive, and no motive can be nobler than the womanly desire to make a pleasant home. But our home can not be properly attractive and profitable to our families if we ourselves are dull and harassed. It is necessary that good housekeepers should read and reflect, and listen and converse.—*Exchange.*

PRESS OPINIONS.

"THE PHRENOLOGICAL JOURNAL for September has just reached us. The mention of Phrenology recalls thoughts of an old acquaintance of ours, a bitter opponent of the science in its earlier development, who upon one occasion, after having, in a dogmatic manner, assailed our opinions and denounced the brain theory of Gall and Spurzheim, remarked, finally, upon parting from us: 'Oh, certainly, there is something in the shape of the head—something in the shape of the head—to be sure there is!' thus directly admitting all that we had claimed; and yet without intending to admit it, or knowing that he was so doing. Nature does nothing by halves, and if there is something in the shape of the head, there is everything in it. Logic is not the strong point of persons who at this day would cast discredit upon Phrenology, a science which every day's experience and every moment's observation demonstrates and supports."—*The Warren* (R. I.) *Gazette.*

"Two papers in this number (August) entitled respectively, 'Ventilation of School-houses,' and 'Obedience to Sanitary Laws,' are worth far more than the cost of a year's subscription to the magazine. It is the only work of the kind in the world, and is certainly a good work to take, containing, as it does, much useful information of a character not to be met with in any other publication."—*Journal of Progress.*

"The increase of years appears but to add vigor and brightness to the JOURNAL, and render it more and more acceptable to its large circle of readers."—*Carleton Sentinel.*

Works by the Late R. T. Trall.—The recent death of R. T. Trall must give a new impetus to the sale of his works. There have never been published any works pertaining to health topics and hygiene which have had so wide a circulation as the works of this author. These books have been scattered broadcast among the English-reading people in all parts of the world, and have been reprinted in German and other foreign languages. On another page will be found a list of these, copies of which will be sent by mail, post-paid, to any address on receipt of price. Agents can do well canvassing for them. The present is certainly a most favorable time.

Easy-Chairs.—Now that the winter season is approaching, a season of rest from out-door activity, easy-chairs will be in demand. In many homes there are not enough of comfortable seats. An old-fashioned, straight-backed rocker, and, perhaps, a sewing-chair for the ladies' use, is all that will be found, while the poor men and the rest of the family have to sit on straight-backed wooden chairs but little better than benches. Every moment of time that is spent by an active person in sitting should be a moment of luxurious ease and rest, in which there will be an opportunity for recuperating strength and vigor. And in this connection we wish to recommend strongly the "Common-sense" chairs, made by Mr. F. A. Sinclair, at Mottville, Onondaga Co., N. Y. These are the most durable and best chairs for the money we have ever seen, being well made, of the best materials, at fair prices and in great variety. The Centennial Rocker is a special favorite, but it would be difficult to choose one that would not be. Mr. Sinclair publishes a neat illustrated descriptive price list, which will be sent free to every reader of THE PHRENOLOGICAL JOURNAL who will send address with stamp.

The New England Phrenological JOURNAL.—This was the name of a small publication, started a few months ago, by Irwin & Co., at Holyoke, Mass. Mr. Irwin was very earnestly interested in the subject of Phrenology, and took this as a means of extending the interest to others. After publishing several numbers, he does not find sufficient support for his little enterprise to justify its continuance, and the August number contains his valedictory. He says: "If we had directed our attention to the latest love-story or leading romance, and had printed advertisements of yellow-covered literature, our endeavors would, without the least doubt, have been crowned with success." No doubt this is true.

Watches as Premiums.—As will be seen from our premium list, we have made new arrangements for the offer of watch premiums. The "New York Watch Co.'s" watches stand high in the estimation of the trade and those who have used them. We think they have not been advertised to the same extent as others, and therefore are not so widely known. We have arranged with our near neighbors, Messrs. Quimby & Co., manufacturing jewellers, of 737 Broadway, for the procuring of these watches on terms which enable us to make the favorable offer found on another page. Here is an opportunity for obtaining a good reliable time-keeper, simply by a little well-directed effort.

Boys! Attention!!—Here is something of interest to you; all of you who would like to have a neat, boy's size, silver watch. A good time-keeper, and one that you might own. We have arranged for procuring a quantity of these small watches, made by the celebrated American Watch Co., for distribution among the boys of our patrons. By our Premium List on another page, you will find that by procuring just a few subscribers to the JOURNAL, you can become the owner of one of these excellent time-keepers.

Show the JOURNAL to your friends, and let them know what you desire to do, and we are certain they will help you, and get the worth of their money in the reading of THE PHRENOLOGICAL JOURNAL. So, boys, now is your chance.

What he Thinks.—Mr. E. A. N., a correspondent residing in Arkansas, writes: "I just received your books—a package of PHRENOLOGICAL JOURNALS—which you sent me. Please accept my most sincere thanks. Words fail to express the delight they afford me in perusing their contents. I shall start to-morrow to distribute some copies which I have, and hope to send you a good-sized club soon from the rural districts of Arkansas. I do not wish any premium for my services, unless I can get a large club, and then let it be a copy free for the pastor of the T—— Church, who is a strong advocate of Phrenology.

A Garden-Pump and Fire-Engine.—The "Dana Bickford Co.," of 689 Broadway, New York, manufacturers of the Dana Bickford Knitting Machine, have just introduced the most complete and perfect machine ever offered to the public for watering the garden and flowers, for washing windows, carriages, wagons, etc., and invaluable in case of a fire which, if taken at the start, a small quantity of water will be sufficient to prevent an entire loss of property; it works so easily and simply, that any child can use it, and water may be thrown over an area of from 60 to 80 feet. It may be drawn from a pail or through rubber tubing 100 or 200 feet long, or from a cistern. There is no piston, no stuffing box, no friction, no leakage, or any of the disagreeable contingencies found in connection with other suction and force pumps. We have tried them and know whereof we speak; besides, they are sold at the low price of $5.00. And to facilitate their more extensive introduction at once, we have been able to make arrangements by which we can offer one of these pumps for only four subscribers to the JOURNAL, at $2.00 each, and surely every owner of a house or garden can now procure one. Send on the subscribers, or we will send on receipt of price, $5.00.

Trall's Hygienic Institute.—As will be seen by the advertisement on another page, the Institute established in New York by Dr. Trall will be continued by those who were associated with him; Mrs. Trall, who has had many years experience, and who is an accomplished and experienced physician, remains in charge, and will be assisted in such departments as additional services are required. The house is pleasantly and centrally situated, and invalids will find it a pleasant home.

Crayon Portraits.—We would call the attention of our readers to the advertisement in another column of Miss L. E. Benton. We have seen some of her work, which was very commendable. Her conditions are certainly generous, and our readers will do well to give her a trial.

The Emphatic Diaglott: containing the Original Greek Text of the New Testament, with an Interlineary Translation on the renderings of Eminent Critics, Various Readings of the Vatican Manuscript, Explanatory Foot-Notes, Alphabetical Index, etc., etc. By Benjamin Wilson. Published by S. R. Wells & Co., New York. Price in cloth, $4.00. In extra binding, $5.00.

"The book can easily be sent by mail to any address. We suggest to every minister that he enclose his next $5.00 marriage fee to S. R. Wells & Co., 737 Broadway, New York, and secure this excellent work. It will prove a most profitable companion to every itinerant as he travels among the people."—*Methodist Recorder.*

Personal.

Henry M. Stanley, whose successful expedition in search of Dr. Livingstone awakened world-wide admiration, has achieved another triumph. Livingstone discovered the great river Lualaba, Cameron followed its course a certain distance, and geographers suspected its connection with the Congo; but it has remained for Stanley to establish beyond a doubt that the Lualabá and the Congo are one river. With a courage and endurance rarely equaled, this intrepid explorer followed the course of the great river to its mouth on the Atlantic coast, braving dangers that even Cameron shrank from.

Mr. Geo. Muller, the Englishman who has founded and sustained several orphan asylums for years, with the contributions received, as he alleges, simply and solely in answer to prayer, is now in the United States. "I have been going on now forty-seven years," he says in a published address, "simply dependent on the Lord for my necessities, both as pastor of the church and director of the institution to which I have given the greatest part of my time."

Thomas F. Field for many years a wholesale crockery merchant of this city, recently died at his residence, 88 Sixth Avenue, Brooklyn, at the advanced age of eighty-four years. Mr. Field was the oldest member of the crockery trade in New York, if not in the country, having been connected with it for nearly seventy years. He started in business in Utica, and in 1824 made the first direct importation of crockery ever carried over the Erie Canal.

Mr. Moses Rogers, or "Uncle Moses," as he is familiarly called, of Huntington, L. I., is ninety-six years old, and still superintends the operations of his farm, feeds his stock, and occasionally visits New York and other places to look after his vessel property, of which he is a large owner. An old gray head which has lived usefully!

Prof. J. J. Watson has inaugurated an enterprise having for its object the supply of good musical entertainments to the New York public, at the low price of ten cents for admission. Mr. Peter Cooper seconds the movement, as all advocates of popular education must. The entertainments, which are excellent, will be given weekly for a year.

Le Verrier, the great French astronomer, died on the 23d of September last, aged sixty-six years. His wonderful mathematical powers placed him in the foremost rank of science; and his famous demonstration of the existence of the planet Neptune won for him the highest honors from the scientific world years ago. Like Agassiz, he died poor.

Julia Colman has become the editor of *The Young Comrade*, an illustrated temperance paper, published at Rockland, Maine. So long as Miss Colman has charge of its columns, the temperance question will be discussed soundly and ably.

The principal prize in applied mechanics and mathematics at the University of London this year was taken by Miss Ellen M. Watson, who also won the Meyer de Rothschild scholarship, worth £50 per annum.

Dr. T. Goodwin, who attended or treated Mr. James Lick in his later periods of illness, has sued the estate of that moribund millionaire for $7,000, the estimated value (?) of his medical services.

Dr. Schliemann has been announced to come soon to America, but he will probably not come until he has finished the book which he is now writing on his discoveries in Greece.

J. C. Ayer, the celebrated pill manufacturer, is incurably insane, so have testified certain well-known doctors. Devotion to money-making is the cause of it.

Field Marshal Wrangler, of Germany, is ninety-four years old, and is in good health and vigor.

George Sand (Madame Dudevant), in the opinion of her doctor, died of strong coffee.

Business.

Notice —The Phrenological and Publishing Business heretofore conducted by the late S. R. WELLS (formerly Fowler & Wells), will be continued by his widow, Mrs. CHARLOTTE FOWLER WELLS, under the firm name of S. R. WELLS & Co. Correspondents, Agents, and others, when communicating on business matters connected with this office, should address their letters to

S. R. WELLS & Co., 737 Broadway, N. Y.

To Our English Readers.—We desire to announce to our readers and friends in the British Provinces, that we will accept as payment for our publications English or other foreign postage stamps, at the rate of 4s. 6d. for a dollar's worth, and send our books by mail, post-paid, at prices given in our announcements and lists. This will, without doubt, be a great accommodation to many, as our books are not always to be found in the local book-stores. If a book advertised at $1.50 is desired, send 6s. in postage stamps, and for other books at proportionate rates, and they will be sent by return mail.

Saratoga Springs.—Drs. Strongs' Remedial Institute has Turkish, Russian, Sulphur, Hydropathic and Electrical Baths, Vacuum Treatment, Inhalation of Oxygen, Compressed and Rarefied Air, Health-Lift, etc., for the treatment of Nervous, Lung, Female, and other Chronic Diseases.

Benefit of an Examination.—Chicago, Ill., July 4th, 1877. S. R. WELLS & Co:—You may not remember me, but I shall never forget you nor your kind advice. About six months ago I sent you my photograph for analysis of character. I was then in a most wretched state of health, and desired your advice as to treatment. That advice and kindly encouragement has done me a great deal of good. I have continued to improve until my health may be considered firmly established. I have great faith in Phrenology, and that faith is being fortified by daily observation. L. B. M.

The Mirror of the Mind gives full directions for the taking of pictures for examination as above, and copies will be sent by mail on receipt of stamp. Address S. R. WELLS & Co., 737 Broadway, New York.

Business Cards.

Trall's Hygeian Home, 102 East 22d Street, New York. Address Rebecca L. Trall, M.D.

No. 47 Lafayette Place, New York,
Opposite the Astor Library.

Healds' Hygeian Home,

Wilmington, Delaware.

Still Lower Rates! A Meat Table Added!

Knowing that we possess advantages for our work of restoring invalids to health not surpassed by any similar institution, and desiring to extend them to those whom the "hard times" have deterred from coming to us, we have again reduced our terms as follows: *Board*, $7 to $13 per week; *Board and Treatment*, $8 to $15 per week, according to rooms. Special rates for several months. No extras except Examination Fee, $5, and "Movements," $2 per week.

ADVANTAGES: Large, double-wall brick building, erected for our work, beautifully and healthfully located; fine grounds, extended views, adjacent groves, pleasant walks; delightful breezes in Summer from river, bay, and not-distant ocean. City conveniences with country surroundings, pure air, etc.

☞ Splendid Fruit and Vegetable Market and a *Model Garden*, furnishing us with varied, choice fresh material daily. *Peaches twice per day* for nearly three months, with cultivated Berries, Pears, Apples, Melons, Plums, Grapes, Sweet Peas, Sweet Corn, Lima Beans, Tomatoes, etc., etc., in like abundance. Meat for those who require it. In short, *the most attractive and liberal Hygienic Table* in America! (We are now canning, in glass, 1,000 half-gallon jars of fruit, etc., for Winter use).

"Swedish Movements" thoroughly and conscientiously administered—one-half hour's manipulation of each patient daily by the operator. ☞ Improved Hot-Air and Steam-Bath apparatus, in which the head is not exposed to the heat and impure exhalations from the body, and is kept cool by a constant gentle spray or douche. All judicious Water-Baths and Sun-Baths. Social and intellectual pleasures. Steamboat and other excursions. One hour from Philadelphia with its great "International Permanent Exhibition."

The physicians have treated several thousands of invalids successfully, without medicines, during the past seventeen years. Young Men will find in Dr. P. Heald a valuable counselor and friend, and Dr. Mary H. Heald's experience and successful treatment of *invalid women*, from nearly every State in the Union, is a guarantee that the sick will receive at her hands the medical care and sympathy they require. House heated *throughout* by steam in Winter, and *thoroughly ventilated*. Send stamp for Circular to

Drs. Pusey and Mary H. Heald.

What's Wanted?

A live, wide-awake Local Agent for live publications. We offer the very best Premiums—more liberal than any other publisher—or, a splendid cash commission. Send stamp for an illustrated Premium List. Most liberal discount made on books. Address S. R. Wells & Co., Publishers, 737 Broadway, New York.

TRALL'S HYGIENIC INSTITUTE,

Established in New York a few months since by the late R. T. TRALL, M.D., will be continued in all its departments by the undersigned, who has been for many years actively engaged in the work with Dr. Trall. The services of other competent physicians have been secured, and we are prepared to treat all cases with the best of Hygienic Agencies. Strangers visiting New York will find here good accommodations, with hygienic diet and baths. Send for circulars. Address **REBECCA L. TRALL, M.D., 102 East 22d St., N. Y.**

NEW YORK, May 25, 1876.

WAKEFIELD EARTH CLOSET CO.
34 Dey Street, N. Y.

Gentlemen:—100 of your WAKEFIELD EARTH CLOSETS have been in use *four years* in Central Park. They have given *entire satisfaction.* We have ceased using the Water Closets, which were *contaminating the water* of our lakes.

Respectfully,
JULIUS MUNCKWITZ, Supt. D. P. P.

The Dry Earth System has been depressed by inadequate machinery. With the use of the "Wakefield Complete," "The Cabinet," "The Privy Fixture," or "The Combined Ash Commode and Slop Pail," as convenience may require, the great merits of the system are becoming more evident. These are more capacious, certain, cleanly, odorless, and handy than any others. The sale of all others has nearly ceased. The sale of the above is constantly increasing, illustrating the "survival of the fittest." For further particulars address, with stamp,

THE HANDY EARTH COMMODE CO.,
34 DEY ST., NEW YORK.

Vick's Catalogue, 300 illustrations, only 2 cents.

Address JAMES VICK, Rochester, N. Y.

HOW TO MAKE

GRIDDLE, OR PAN CAKES,

BY THE USE OF

HECKER'S SELF-RAISING

GRIDDLE CAKE
TRADE MARK

FLOUR,

MAY BE SEEN AT

THE AMERICAN INSTITUTE FAIR.

Although it is only three years since this article (prepared expressly for making Griddle Cakes, Wheat Cakes, or Pan Cakes), was introduced to the public, it has become as popular as the other well-known brands of Hecker's Self-Raising Flour, which have been so extensively used for making Bread, Biscuit, Cakes, etc., for the past twenty-seven years.

It is decidedly the cheapest and best preparation known for making Griddle Cakes, Wheat Cakes, or Pan Cakes; Muffins, Fritters, etc.; producing at a moment's notice, by the addition only of cold water or milk, most delicious, light, and wholesome cakes, which may be eaten while hot without detriment.

The Griddle Cake Flour is used by many in preference to Buckwheat.

Put up in three and six pound packages (with a yellow label), 24½ pound bags, barrels, and half-barrels, with full directions for use.

FOR SALE BY ALL GROCERS, OR AT THE
CROTON MILLS, 203 CHERRY ST., NEW YORK.

EVERYBODY'S FAVORITE ROCKER.

COMMON SENSE

Rocking Chairs!

A GOOD EASY-CHAIR

Is considered by many one of the most desirable things of earth. When one is rid of fatigue and weariness, and can bear with tedious visitors and commonplace remarks, and left to his own reflections, he finds himself amid society of phantoms and visions suited to his mind.

Those in need of such a chair will please send stamp for Illustrated Circulars and Price-List to

F. A. SINCLAIR,
Mottville, Onondaga Co., N. Y.

On Sale at 218 Fulton St., Brooklyn, and in New York.

☞ Don't buy a Chair unless it has my name stamped on the frame.

LOOK FOR THE STAMP.

DRS. WALTER'S MOUNTAIN HOME,

WERNERSVILLE, BERKS CO., PA.

A new and first-class Health Institute, modern in all its appointments, built by the Drs. Walter for the purpose of Illustrating in practice the principles of the NUTRITIVE CURE. Its opening season has been a noteworthy success—so much so as to justify the claim of superiority in all important particulars. In the following respects we can unreservedly commend it as being surpassed by none on the continent:

Healthfulness of Location, Beauty of Scenery, Equableness and Mildness of Climate, Purity of Air, Purity and Softness of Water, Ease of Access, the Convenience of its Arrangements, and Thoroughness and Accuracy of its Management.

Its physicians are educated and of long experience in the practice of the True Healing Art. They are ambitious to excel, energetic in effort, positive in management, and earnestly devoted to their work. Sixteen years of observation and practice, extending over the whole range of hygienic appliances, has enabled us to employ:

1st. The **WATER-CURE** in moderation, avoiding its excesses while retaining its valuable features.

2d. The **MOVEMENT-CURE.** This Institution is the fountain-head of Hygienic Movement-Cure, *administered as an essential part of the treatment, and in all cases free of extra charge.*

3d. **SUN-BATHS.** So, too, we have led the van in the application of Sun-baths. For ten years we have been earnest investigators into this mode of treatment, and our SUN-BATH and BLUE-LIGHT rooms are models of excellence.

4th. The **DIET-CURE.** Good food and plenty of it, and such as is suited to the needs of the individual, expresses our ideas of diet. We believe in neither starving nor stuffing, but seek the golden mean between the extremes.

5th. The **REST-CURE.** We have one of the most restful places in the world, and great attention is paid to securing rest and sleep to the invalid. Ours is not a Summer-resort, where noise and confusion and excitement torment the invalid.

6th. **ELECTRICITY** and **MAGNETISM** are used as special remedial appliances when necessary.

7th. The **SOCIAL, RELIGIOUS,** and **MORAL INFLUENCES** are relied upon as important curatives (see notice of NUTRITIVE CURE on another page).

STAMMERERS and all interested in speech impediments—send for circulars. The Am. Vi. Institute, 163 Waverly Place, N. Y.

25c. WILL PAY for the PHRENOLOGICAL JOURNAL for Oct., Nov., and Dec. "On Trial." Single Nos. 30c. Send postage stamps as above to S. R. WELLS & CO., Publishers, 737 Broadway, N. Y.

THE MOUNTAIN HOME.

A. SMITH, M.D., Proprietor.

This well-known Health Institution stands preëminently superior in all that pertains to a perfect and complete cure. This is the case to such a degree that other parties have been sending out circulars, etc., claiming for their place that which belongs to the Mountain Home, thus deceiving the public. For cut of the Mountain Home, see August number PHRENOLOGICAL JOURNAL.

The Mountain Home is not merely a *coop* set on the side of the hill, but a palace in all its appointments, built on the side of the mountain. Our superior advantages are: 1st. The purest and softest water; 2d. The largest and most comfortable buildings; 3d. The best location in America; 4th. The purest mountain air; 5th. The grandest scenery; 6th. The greatest home comforts; 7th. The finest climate in the world; 8th. A Western Union Telegraph office in the Home. These, with many other superior advantages, are conceded to The Mountain Home by Mr. Robert Walter, our former tenant.

How Dr. A. Smith treats the sick, and why he is so successful in his practice: 1st. The Water-Cure in which there are no excesses with those who understand its principles and know how to apply it scientifically. To this fact Dr. Smith has hundreds of living examples, who rejoice in the recovery of good health through the proper application of the "Water-Cure;" 2d. The Swedish Movement Cure is one of the leading parts of the treatment at The Mountain Home. Dr. Smith practices this system as given by the great Dr. Lyng, the founder and fountain-head of the Hygienic Movement Cure. By long experience and scientific investigation, Dr. A. Smith has added many new and important features to the system; 3d. Electricity; this remedial agency is given in all cases where it will assist the patient to recover more rapidly; 4th. The Rest Cure. In nine cases out of ten the Rest Cure is absolutely necessary, and The Mountain Home is, above all others, *the* place where invalids have perfect rest and quietude; 5th. The Dietary Department of this Health Institution is beyond a doubt better adapted to the wants of invalids than that of any other Health Institution in this country; and Dr. Smith claims that *too* much preaching, with bad bread and butter, is not conducive to health and happiness.

The natural advantages at "The Mountain Home" being so much greater than elsewhere, Dr. A. Smith can cure the sick in one-half the time it usually takes at other Cures. With divine aid and renewed energy, we shall try to surpass our former great success in the practice of the true healing art. For further information and circular, address

A. SMITH, M.D., MOUNTAIN HOME,
Wernersville, Berks Co., Pa.

One of the Brightest Charms

Of a fair face is a fine set of teeth. The ladies being fully alive to this fact, patronize

SOZODONT

in preference to any other dentifrice, since they know by experience that it preserves like no other the pristine whiteness and cleanliness of the teeth, and makes a naturally sweet breath additionally fragrant. It is one of the privileges of the *beaux sex* to look lovely and that proportion of it which uses **SOZODONT** has learned that the article contributes in no small degree to the end in view.

ALL DRUGGISTS SELL IT.

Dr. Warner's Health Corset,

With Skirt Supporter and Self-Adjusting Pads.

MOTHER'S HYGIENIC

HAND-BOOK, for the Normal Development and Training of Women and Children, and the Treatment of their Diseases with Hygienic Agencies. By R. T. TRALL, M.D. $1.00, by mail, post-paid. Address S. R. WELLS & CO., Publishers, 737 Broadway, New York.

LAURIE & McCLATCHEY'S

HOMŒOPATHIC

DOMESTIC MEDICINE.

EIGHTH EDITION.

BOERICKE & TAFEL, New York and Philadelphia.
1,044 pp., large 8vo. Half morocco, Price $5.

This is the most complete and comprehensive work on the subject in the English language. It gives a concise description of diseases and their Homœopathic treatment. Of the original work of Dr. Laurie **21,000** copies are in circulation in England. Dr. McClatchey added the indigenous American Remedies, and thus brought it up to date. Of this improved American edition, the **Eighth** has just been issued within six years, which fact speaks volumes in its favor. Send stamp for descriptive Price Current of this and other books. Address BOERICKE & TAFEL, HOMŒOPATHIC PHARMACY, 145 Grand Sreet, New York. Business established in 1835.

LETTERS TO WOMEN

ON

Midwifery and Diseases of Women.

A Descriptive and Practical work, illustrated with numerous cases of treatment. By JOEL SHEW, M.D. 12mo, cloth, 432 pages, price $1.50.

This is one of Dr. Shew's best and most useful books, which has for some time been out of print. A new edition is now handsomely published, and must meet with a good sale. The following from the Table of Contents will give something of the nature and scope of this work:

The History of Midwifery; Menstruation—its Pathology and Derangements; Signs of Pregnancy—its Duration; Disorders and Management; Sterility or Barrenness; the Pelvis and its Organs; the Fœtus; Phenomena of Labor and its Management; Management of the Child; Hygiene of Nursing; Twins, Triplets, etc.; After-Pains; the Lochial Discharge; Child-Bed Fever; Sore Nipples; Inflammation of the Breast; Hysteria; Leucorrhœa; Displacements, etc.

This work should be in the hands of every mother and of every daughter who has arrived at years of maturity. A very large proportion of the diseases of women are the result of ignorance of the laws of life and the proper care of themselves. This book will point the way which, if followed, will lead to perfect health and happiness.

Sent by mail, post-paid, to any address, on receipt of price, $1.50. AGENTS WANTED. Send for terms and descriptive circular, with Table of Contents. Address

S. R. WELLS & CO., Publishers, 737 Broadway, New York.

New Temperance Publications.

The National Temperance Society has just published the following, and solicits orders from the trade:

Alcohol and the State.

12mo, 406 pp., price $1.50. By ROBERT C. PITMAN, LL.D., Associate Judge of the Superior Court of Massachusetts. It treats, with great conciseness and marked ability, of what the State loses in various ways through alcohol, and, in turn, of what is the duty and proper function of the State concerning alcohol. It is of a high order of literary merit, and is a book for statesmen, legislators, and all intelligent, thoughtful temperance men and women everywhere.

Water Spouts.

Square 12mo, 256 pp. A new and attractive holiday book for children, containing short stories and sketches, and over 150 illustrations, puzzle pictures, puzzles, and rebuses, and is handsomely bound in cloth, with gilt and chromo side stamp. It will be issued Oct. 15th. Early orders solicited. Price $1.

Readings and Recitations.

12mo, 96 pp., price, paper covers, 25 cents; cloth, 60 cents. By Miss L. PENNEY. A collection of choice articles of poetry and prose, adapted for use in schools and all temperance organizations.

Water-Lilies.

208 royal 8vo pp., $1.50. A handsome gift-book for the young, containing a series of short, attractive stories and anecdotes, together with 170 illustrations, all of rare beauty and excellence, and is handsomely bound in cloth, with illuminated gilt and chromo side stamp, making it one of the handsomest and cheapest gift-books ever published.

Address,

J. N. STEARNS, Publishing Agent,

58 READE ST., NEW YORK.

Works on Hygiene,

By the late R. T. TRALL, M.D.

Anatomical and Physiological Plates. These Plates were arranged expressly for Lecturers on Health, Physiology, etc. They are six in number, representing the normal position and life-size of all the internal viscera, magnified illustrations of the organs of the special senses, and a view of the principal nerves, arteries, veins, muscles, etc. For popular instruction, for families, schools, and for professional reference, they will be found far superior to anything of the kind heretofore published. Fully colored, backed, and mounted on rollers (net) $20, by express.

Hydropathic Encyclopedia, A System of Hygiene, embracing Outlines of Anatomy—illustrated; Physiology of the Human Body; Preservation of Health; Dietetics and Cookery; Theory and Practice of Hygienic Treatment; Special Pathology and Therapeutics, including the Nature, Causes, Symptoms, and Treatment of all known Diseases; Application of Hydropathy to Midwifery and the Nursery. Nearly 1,000 pages, including a Glossary, Table of Contents, and a complete Index. Designed as a Guide to Families and Students, and a Text-book for Physicians. With 300 engraved illustrations. In one vol. $4.

Uterine Diseases and Displacements. A Practical Treatise on the Various Diseases, Malpositions, and Structural Derangements of the Uterus and its Appendages. Colored plates. $5.

The Hygienic Hand-book, Intended as a Practical Guide for the Sick-Room, arranged Alphabetically. With Appendix, illustrative of the Hygeo-Therapeutic Movements. $1.50.

Family Gymnasium. Illustrated. Containing the most approved methods of applying Gymnastic, Calisthenic, Kinesipathic, and Vocal Exercises to the Development of the Bodily Organs, Invigoration of their Functions, Preservation of Health, and the Cure of Diseases and Deformities. $1.50.

Hydropathic Cook-Book, With Recipes for Cooking on Hygienic Principles. Containing, also, a Philosophical Exposition of the Relations of Food to Health; Chemical Elements and Proximate Constitution of Alimentary Principles; Nutritive Properties of all kinds of Aliments; Relative Value of Vegetable and Animal Substances; the Selection and Preservation of Material, etc. $1.25.

The True Temperance Platform; or, An Exposition of the Fallacy of Alcoholic Medication. Being the substance of addresses delivered in the Queen's Concert Rooms, Hanover Square, and in Exeter Hall, London. 50 cents.

Fruits and Farinacea the Proper Food of Man; being an attempt to prove from history, anatomy, physiology, and chemistry that the original, natural, and best diet of man is derived from the vegetable kingdom. By John Smith. With Notes and Illustrations by R. T. Trall, M.D. $1.50.

Mothers' Hygienic Hand-book, for the Normal Development and Training of Women and Children, and Treatment of their Diseases with Hygienic Agencies. $1.

Popular Physiology. A Familiar Exposition of the Structures, Functions, and Relations of the Human System and their Application to the Preservation of Health. Muslin, $1.25.

Diphtheria; its Nature, History, Causes, Prevention, and Treatment on Hygienic Principles. With a resumé of the various theories and practices of the medical profession. $1.25.

Digestion and Dyspepsia. A Complete Explanation of the Physiology of the Digestive Processes, with Symptoms and Treatment of Dyspepsia and Disorders of the Digestive Organs. $1.

The Human Voice. Its Anatomy, Physiology, Pathology, Therapeutics, and Training, with Rules of Order for Lyceums. More than 50 illustrations. Paper, 50 cents; muslin, 75 cents.

Water-Cure for the Million. The Processes of Water-Cure Explained. Popular Errors Exposed. Hygienic and Drug Medication Contrasted. Rules for Bathing, Dieting, Exercising, etc., given. Recipes for Cooking, Directions for Home Treatment. Paper, 25 cents; muslin, 50 cents.

The True Healing Art; or, Hygienic *vs.* Drug Medication. A plain, practical view of the whole question, including an address before Smithsonian Institute. Paper, 25c.; muslin, 50c.

The Hygeian Home Cook-book; or, Palatable Food without Condiments. A Complete Book of Recipes or Directions for Preparing and Cooking all kinds of Healthful Food in a Healthful Manner. Paper, 25 cents; muslin, 50 cents.

The Alcoholic Controversy. A Review of the *Westminster Review* on the Physiological Errors of Teetotalism. 50 cents.

Diseases of Throat and Lungs, including Diphtheria, and their Proper Treatment. Illustrated. Paper, 25 cents.

The Bath. Its History and Uses in Health and Disease. With 20 engravings. Latest and best work. Price, 25 cents; muslin, 50 cents.

Accidents and Emergencies. A Guide containing Directions for the treatment in Bleeding, Cuts, Stabs, Bruises, Sprains, Ruptures, Broken Bones, Dislocations, Accidents, Burns and Scalds, Bites of Mad Dogs, Inflammations, Cholera, Diarrhœa, Injured Eyes, Choking, Poisons, Fits, Sunstroke, Drowning, etc. By Alfred Smee. With Alterations, Corrections, and Appendix by Trall. 25 cents.

A Health Catechism. Questions and Answers. With illustrations. 10 cents.

Or any of the Agencies.

DANA BICKFORD'S
Garden-Pump and Fire-Engine.

This is the most perfect and most easily-worked machine of the kind ever made, and makes an article of this kind of universal usefulness. One of these should be found in every household for use in watering Gardens, Flowers, Conservatories, washing Windows, Carriages, Buildings, etc., and for use in case of Fire, when it will be found very efficient, and for any purpose where a force or portable pump is used. It is worked by an easy motion of a lever to and fro, so easy that a lady or child can throw a steady stream of water over an area of 60 to 80 feet, or on the top of buildings from a pail or tank at hand, or from a distance of one or two hundred feet, without the least fatigue.

Believing these will be universally wanted, we have arranged to offer them as Premiums for Clubs to the PHRENOLOGICAL JOURNAL on most favorable terms. The price is only $5, and given for a Club of only four subscribers at $2 each, or it will be sent to any address on receipt of price, $5.

WE OFFER THIS

KNITTING MACHINE

To the Public in the fullest confidence of its absolute, unquestioned superiority over all other machines of the kind. Every known improvement is embodied in it, making it by far the most simple, durable, and efficient Knitting Machine ever placed in market.

This machine, and the Garden-Pump, are manufactured by the Dana Bickford Co., 737 Broadway, N. Y.

These Machines are easily managed; not liable to get out of order; can be attached to an ordinary table and worked by a child. Adapted to the production of a great variety of work, both of plain homespun for wearing apparel, hosiery, etc., and elaborate crochet stitching of the most varied character, limited only by the skill and taste of the operator, making it a never-ending source of pleasure or easy support to those that require it, as a good operator can make from two to eight dollars per day.

These Machines are sold for $30, and we offer them for only fifteen subscribers to the PHRENOLOGICAL JOURNAL at $2 each (just the price of the Machine alone).

Send Twenty Cents for Agents' Outfit, and procure one of each of the above at once. AGENTS WANTED to canvass for the PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH. Liberal Premiums or Cash Commissions are given. Address

S. R. WELLS & CO., Publishers, 737 Broadway, New York.

Publishers' Department.

The business affairs pertaining to the publication and circulation of this Journal, and other miscellaneous and current matter, with advertisements, in general, are inserted in this department.

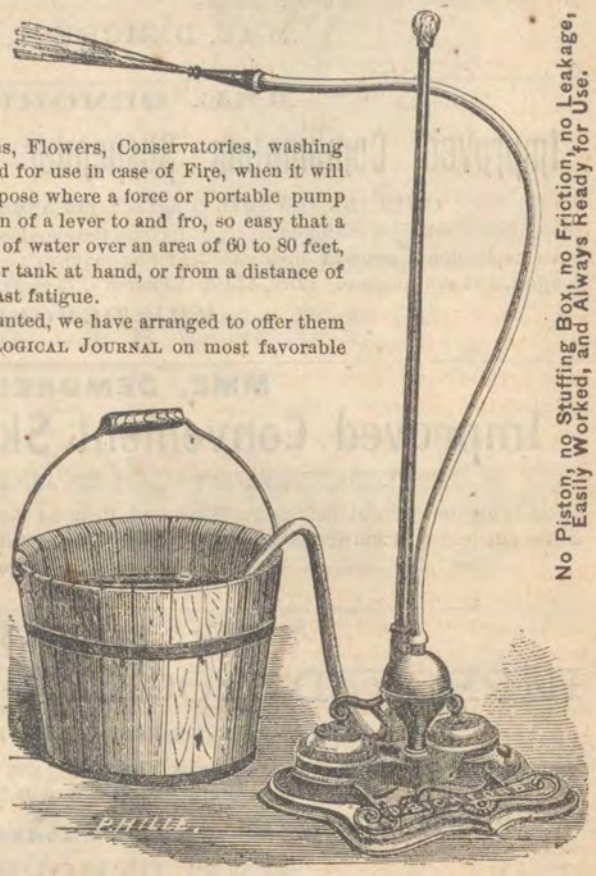
ANNOUNCEMENT FOR JANUARY.

In preparation for the January number are sketches of the late Senator Morton, of Indiana; Thos. A. Edison, the Electrician, and Henry Meiggs, the "Railroad King" of South America. Also, may be expected: Moulds, their Growth and Characteristics, illustrated; Croup in Children, with Notes on its Treatment, illustrated; How Joe Lost a Bad Reputation—for our boys; Falling Through Space—a Question of Consciousness; Individual Progress; No. X. of the excellent Letters to a Son in College; additional chapters of Light in Dark Places, with illustration, etc., etc. A fine opening number for 1878.

Among the features of interest to readers of THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH for 1878, the following will have prominence: A series of papers descriptive and analytical of Phrenological science, with appropriate illustrations; continuation of the story entitled "Light in Dark Places," with its excellent practical suggestions on mental culture and physiology; "My Home Kindergarten," a narrative to run through several numbers, in which principles of child education will be illustrated; valuable treatises from the best German, French and other sources on topics in practical physiology, therapeutics, hygiene, etc.—these will be illustrated in most instances; two or more biographical sketches of conspicuous persons with the customary phrenological notes, and portraits will be presented in each number; correspondence, scientific and social, from different parts of the world; a succinct review of the more noteworthy incidents in the progress of science and invention; discussions of topics in psychology, moral philosophy, socialism, government; domestic economy, including advice with reference to diet and healthful cookery.

It will be the aim of publishers and editor to make each number of special practical value to the subscriber, and worthy of careful preservation. It has been said that one never sees old copies of THE PHRENOLOGICAL JOURNAL for sale at the second-hand book dealers, as is the case with most of the other magazines; but that they are kept after a reading by subscribers and purchasers for future reference. In short, the object for which the PHRENOLOGICAL was originally, and still is, published is not ephemeral gratification, but permanent utility, through a reasonable gratification of the curious and esthetic qualities of the mind.

1878.—This number of THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH closes its publication for the year 1877, and the next number is that of January, 1878. As has already been announced, we have decided on a very important change in the publication and management of the PHRENOLOGICAL for the coming year; that is, the price is to be reduced from $3.00 to $2.00 a year. This is done in view of the continued stringency in money matters, although we believe the worst is passed and that from this time forward renewed activity and prosperity will take the place of stagnation; but desiring to extend as much as possible the circulation of the JOURNAL, and through this a knowledge of Phrenology among the people, we have decided to reduce the price. This will, of course, necessitate some change in the JOURNAL itself, but the size will not be reduced in proportion to the reduction in price, and the quality will, in every way, be fully maintained. Our agent-friends have been met many times with the response: "I can not afford it." "I like the JOURNAL, but times are too hard." "Money is too scarce." "Wait till next year," etc.; but this can not be the case now. With a journal so useful and practical as the PHRENOLOGICAL, offered at $2.00 a year, certainly there should be no excuse for not subscribing. We depend on our present subscribers to make known to the public the fact that the price has been reduced, and trust we may have their co-operation in such way as to accomplish the end we had in view in making the reduction, that is, to greatly extend its circulation.



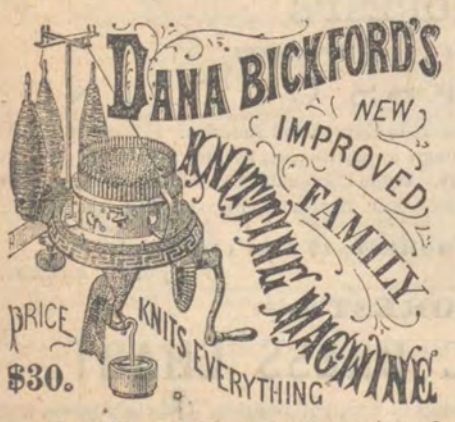
Club Rates.—There are, in many parts of the country, warm and earnest friends of Phrenology who would like to make up clubs in their respective neighborhoods for the JOURNAL, giving to the subscribers the full benefit of the reduction accorded to them. To meet such cases, we have decided to offer ten copies of the PHRENOLOGICAL for one year, sending to as many different post-office addresses as may be desired, at $1.50 each; and as, at least, part compensation to our friends for making up clubs, we will give an extra copy to the person sending in the list of names. Will not some present reader in every town where there is not a local agent, make an effort now to make up a club for the coming year? A little well-directed effort will secure a good list of names.

Renew Promptly.—The publishers would especially urge on the readers of THE PHRENOLOGICAL JOURNAL the importance of promptly renewing their subscriptions for the coming year. It saves to the office much trouble and inconvenience in making up the new books, besides securing to the subscriber an early and prompt delivery of the first numbers of the new year. As a slight remuneration for promptness, we propose to send our new Health Almanac and Annual of Phrenology for 1878 to all who renew before the first of January, sending stamp for postage.

DANA BICKFORD'S
Garden-Pump and Fire-Engine.

This is the most perfect and most easily-worked machine of the kind ever made, and makes an article of this kind of universal usefulness. One of these should be found in every household for use in watering Gardens, Flowers, Conservatories, washing Windows, Carriages, Buildings, etc., and for use in case of Fire, when it will be found very efficient, and for any purpose where a force or portable pump is used. It is worked by an easy motion of a lever to and fro, so easy that a lady or child can throw a steady stream of water over an area of 60 to 80 feet, or on the top of buildings from a pail or tank at hand, or from a distance of one or two hundred feet, without the least fatigue.

Believing these will be universally wanted, we have arranged to offer them as Premiums for Clubs to the PHRENOLOGICAL JOURNAL on most favorable terms. The price is only $5, and given for a Club of only four subscribers at $2 each, or it will be sent to any address on receipt of price, $5.



WE OFFER THIS

ANNOUNCEMENT FOR JANUARY.

In preparation for the January number are sketches of the late Senator Morton, of Indiana; Thos. A. Edison, the Electrician, and Henry Meiggs, the "Railroad King" of South America. Also, may be expected: Moulds, their Growth and Characteristics, illustrated; Croup in Children, with Notes on its Treatment, illustrated; How Joe Lost a Bad Reputation—for our boys; Falling Through Space—a Question of Consciousness; Individual Progress; No. X. of the excellent Letters to a Son in College; additional chapters of Light in Dark Places, with illustration, etc., etc. A fine opening number for 1878.

Among the features of interest to readers of THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH for 1878, the following will have prominence: A series of papers descriptive and analytical of Phrenological science, with appropriate illustrations; continuation of the story entitled "Light in Dark Places," with its excellent practical suggestions on mental culture and physiology; "My Home Kindergarten," a narrative to run through several numbers, in which principles of child education will be illustrated; valuable treatises from the best German, French and other sources on topics in practical physiology, therapeutics, hygiene, etc.—these will be illustrated in most instances; two or more biographical sketches of conspicuous persons with the customary phrenological notes, and portraits will be presented in each number; correspondence, scientific and social, from different parts of the world; a succinct review of the more noteworthy incidents in the progress of science and invention; discussions of topics in psychology, moral philosophy, socialism, government; domestic economy, including advice with reference to diet and healthful cookery.

It will be the aim of publishers and editor to make each number of special practical value to the subscriber, and worthy of careful preservation. It has been said that one never sees old copies of THE PHRENOLOGICAL JOURNAL for sale at the second-hand book dealers, as is the case with most of the other magazines; but that they are kept after a reading by subscribers and purchasers for future reference. In short, the object for which the PHRENOLOGICAL was originally, and still is, published is not ephemeral gratification, but permanent utility, through a reasonable gratification of the curious and esthetic qualities of the mind.

1878.—This number of THE PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH closes its publication for the year 1877, and the next number is that of January, 1878. As has already been announced, we have decided on a very important change in the publication and management of the PHRENOLOGICAL for the coming year; that is, the price is to be reduced from $3.00 to $2.00 a year. This is done in view of the continued stringency in money matters, although we believe the worst is passed and that from this time forward renewed activity and prosperity will take the place of stagnation; but desiring to extend as much as possible the circulation of the JOURNAL, and through this a knowledge of Phrenology among the people, we have decided to reduce the price. This will, of course, necessitate some change in the JOURNAL itself, but the size will not be reduced in proportion to the reduction in price, and the quality will, in every way, be fully maintained. Our agent-friends have been met many times with the response: "I can not afford it." "I like the JOURNAL, but times are too hard." "Money is too scarce." "Wait till next year," etc.; but this can not be the case now. With a journal so useful and practical as the PHRENOLOGICAL, offered at $2.00 a year, certainly there should be no excuse for not subscribing. We depend on our present subscribers to make known to the public the fact that the price has been reduced, and trust we may have their co-operation in such way as to accomplish the end we had in view in making the reduction, that is, to greatly extend its circulation.

Club Rates.—There are, in many parts of the country, warm and earnest friends of Phrenology who would like to make up clubs in their respective neighborhoods for the JOURNAL, giving to the subscribers the full benefit of the reduction accorded to them. To meet such cases, we have decided to offer ten copies of the PHRENOLOGICAL for one year, sending to as many different post-office addresses as may be desired, at $1.50 each; and as, at least, part compensation to our friends for making up clubs, we will give an extra copy to the person sending in the list of names. Will not some present reader in every town where there is not a local agent, make an effort now to make up a club for the coming year? A little well-directed effort will secure a good list of names.

Renew Promptly.—The publishers would especially urge on the readers of THE PHRENOLOGICAL JOURNAL the importance of promptly renewing their subscriptions for the coming year. It saves to the office much trouble and inconvenience in making up the new books, besides securing to the subscriber an early and prompt delivery of the first numbers of the new year. As a slight remuneration for promptness, we propose to send our new Health Almanac and Annual of Phrenology for 1878 to all who renew before the first of January, sending stamp for postage.

Holiday Presents.—The season for holiday presents is again approaching. People are now wondering what they can choose and procure as presents for their friends. We will suggest, first, that THE PHRENOLOGICAL JOURNAL itself will be a most acceptable present to any appreciative friend; besides, it will be a continual present, bringing the holidays twelve times a year. There are few articles more appropriate under nearly every circumstance than useful books. Nothing that will be so constant and pleasant a reminder of the giver as a good book. There is also an opportunity of varied selections, books for all classes, old and young. The readers of THE PHRENOLOGICAL JOURNAL are referred to our lists of publications which have appeared from time to time in the magazine, and they will find there an opportunity of making varied selections. It is not worth our while to name them specially; each person will be able to choose from the titles that which will be appropriate under any given circumstance. We would also call attention to our PREMIUM LIST as affording an admirable opportunity for procuring a suitable holiday present. Here is almost everything which can be desired; books, silver-ware, microscopes, etc. In these hard times this may afford to many an opportunity of making a valuable present to an esteemed friend without the heavy expense which would come from its purchase. Simply a little well-directed effort now and you will succeed. For full description of the varied articles offered send stamp for our large illustrated PREMIUM LIST.

Our New Premium List and Terms TO AGENTS.—We have just issued a new descriptive list of our Premiums. This consists of sixteen pages, handsomely printed and containing a full description of each of the articles offered, with many illustrations. These have already been sent to the address of persons who are entered on our agency book, and will be sent to any others who may desire them. With the JOURNAL at the reduced price, agents should find but little difficulty in making up desired lists of names.

PRESS OPINIONS.

"The magazine has an abundance of scientific and general information, and there is no periodical of the day which we would rather possess. Its mechanical execution is also excellent."—Warren (R. I.) *Gazette.*

"It is impossible to give the reader a fair idea of this extensive and interesting periodical in a newspaper notice; containing, as it does, such a vast amount of sound, instructive reading-matter on so many subjects of interest to the general reader. The letterpress is most unexceptionable, and is beautifully illustrated with portraits of the current characters whose biographies adorn its pages."—Ontario (Can.) *Advertiser.*

"It contains many facts in regard to the cultivation and expansion of the mind, as well as much valuable instruction in regard to the attainment and preservation of health of both mind and body. It is a large monthly, full of good and valuable information."—Hopkinsville (Ky.) *Democrat.*

"This is one of our most esteemed exchanges. It contains much reliable and instructive matter, and is well worth its subscription price."—Genesee (Penn.) *Democrat.*

"This splendid pictorial magazine and first-class monthly journal, devoted to all progressive measures calculated to reform, elevate, and improve mankind, should be in every home in the land. Its contents are always replete with good things."—Breckenridge (Ky.) *News.*

"We have read the JOURNAL since 1867, and deem it the best friend a young man can have—his surest guide to success, if he will only mind its teachings."—North Wales (Pa.) *Record.*

CLUBBING FOR 1878.

For the accommodation of our readers and friends, we have made arrangements for the combining of other publications with our popular and useful magazine as follows: The subscription price of the PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH is $2; and any of the following may be included at the prices given:

Littell's Living Age..	$7 00	Peterson's Lady's Mag	1 60
Eclectic Magazine...	4 25	Weekly Tribune.....	1 60
Galaxy.....	3 50	" Times.....	1 20
Atlantic Monthly....	3 50	" World.....	1 00
Appleton's Journal..	2 50	The Nursery.....	1 20
Lippincott's Mag....	3 25	Western Rural.....	1 75
Harper's Monthly....	3 50	Young Folks mo.....	1 10
" Weekly.....	3 50	Country Gentleman..	2 25
" Bazar.....	3 50	Floral Cabinet.....	1 15
Scribner's Monthly...	3 40	Prairie Farmer.....	1 75
St. Nicholas.....	2 50	The Christian Union.	2 70
Popular Sci. Monthly.	4 25	Christian at Work....	2 50
Godey's Lady's Book.	2 50	Boston Weekly Globe	1 40
Arthur's Home Mag...	2 25	Illus. Christ'n Weekly	2 25
Rural New Yorker..	2 25	American Grocer.. ..	2 25
Scientific American..	2 75	Evening Post.....	1 25
Demorest's Magazine.	2 50	Poultry World.....	1 00
Home Journal	2 25	Gardeners Monthly ..	1 75
The Methodist.....	2 25	Christian Intelligencer	2 50

The only condition for obtaining the above reduction is that the person ordering shall subscribe for the PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH, then any number of the above publications may be ordered. Make up your list and send on the amount, saving time, money, risk, and trouble. Address all orders to S. R. WELLS & Co., Publishers, 737 Broadway, New York.

The Health Almanac for 1878.—This is now looked upon as a household necessity in many families, and to cease its publication would be a great disappointment. Its circulation is constantly increasing. The number for 1878 is an excellent one in every particular, filled with useful matter and timely suggestions. The price is only ten cents, and supplied to our friends who desire it for distribution at the rate of seventy-five cents per dozen copies. It is hoped every reader of THE PHRENOLOGICAL JOURNAL will endeavor, as far as it is possible, to put this Health Almanac in the place of the many patent medicine almanacs throughout the country. It is a good missionary document, and we trust those interested in the cause will aid in its circulation.

The evenings are getting long. Summer, with its tropical nights, no longer necessitates sleeping in the woodshed or in hidden recesses where the mosquitoes dare not molest or make afraid. And with long, cool evenings comes the desire for recreation. To gratify this desire no family should be without a magazine filled with useful and instructive reading-matter. We receive many such magazines at this office, among which THE PHRENOLOGICAL JOURNAL is, in our estimation, by far the most useful and instructive. It contains no literary vapors, no silly twaddle, no nonsensical speculations, but is brimfull of sound, solid, practical advice, intermingled with scientific deductions and well-authenticated facts. It is impossible to enumerate here all the subjects handled in this magazine: suffice it to say, it should be warmly received in every household."—*Crawford Co.* (Iowa) *Bulletin.*

"Why Mar the Image?"—We regret that the publication of this promising serial was so abruptly suspended by the severe illness of the writer, Mrs. Duniway, who has not been able to continue it since. The conclusion of Peacemaker Grange is reached in this number, as the reader is probably aware,

Worcester's Quarto Dictionary.—A large, handsome volume of 1,854 pages, containing considerable more than 100,000 words in its vocabulary, with the correct Pronunciation, Definition, and Etymology, fully illustrated. Library sheep, marble edges. Price, $10.00. J. B. Lippincott & Co., Publishers, Philadelphia, Pa.

This series of Dictionaries are now rapidly growing in favor and are being introduced and accepted as standard in many educational institutions, publishing offices, etc., and by eminent scholars. *The Evening Post*, in a recent notice, says:

"It is known that Worcester's has long been considered the standard dictionary of the English language by such eminent philologists as Marsh, such scientists as Agassiz, such poets as Longfellow, such statesmen as Sumner, such educators as Mann; and that its spelling is the standard of the National Printing Office at Washington. It follows from this with unerring accuracy that Worcester's Dictionary, being preferred over all others by scholars and men of letters, should be used by the youth of the country and adopted in the common schools."

The Annual of Phrenology and Health Almanac for 1878 will contain, among its list of subjects, the historian and diplomat, John L. Motley; Dr. Russell T. Trall, the eminent hygienist; Spectacles—how to Choose and Wear them, with numerous illustrations; Faces and their Influence; President Hayes, with a phrenological sketch by Prof. L. N. Fowler; Some Counsel to Boys about Business, by James Parton; besides poetry, advice with reference to the care of the health, the treatment of different maladies, recipes for preparing healthful food, hints to the housekeeper and farmer, etc., etc. Price, ten cents.

Personal.

Mr. Erastus Brooks has retired from the editorship of the New York *Express*, after forty years of newspaper work.

Rev. Anna Oliver is settled as pastor of a church at Danville, N. Y.

Prof. G. Morris, the Phrenologist, is well reported of by the western newspapers, and appears to be making a success of his extensive tour.

Dr. Benjamin Walworth, of Fredonia, New York, a brother of Chancellor Walworth, is the oldest practicing physician in the State. He was born in 1792, and is still actively engaged in feeling pulses and looking at tongues.

P. T. Barnum is reported as saying: "I have seen a good many people humbugged during my life, and I have been humbugged myself, but I have noticed that more persons, on the whole, are humbugged by believing in nothing than in believing in too much."

Richard M. Bishop, of Cincinnati, was elected Governor of Ohio at the late election, by 20,000 majority. The Democrats made a good selection in Mr. Bishop. There were five tickets in the field, the others being the Republican, Prohibition, National, and Workingmen's.

Mrs. Maria B. Holyoke, "Lecturer and Organizer" of the State Temperance Union, shows a record of a year's work which will compare favorably with any man lecturer's, we think. During the year she has delivered 215 lectures and addresses at different points, necessitating 12,400 miles of travel.

Mr. Delane has retired from the editorial management of the London *Times*, a position which he has held for thirty-seven years. "And he really edited it. His control," says Mr. Smalley, "was complete; while his supervision of its leader columns was so vigilant, his editorial direction of the paper so absolute, that it was his individual opinion which went forth every morning. He did not write, but dictated what should be written."

Oliver Perry Morton, Senator of the United States, died November 1st, at his residence in Indianapolis. Several years ago he was prostrated by a stroke of paralysis, induced by severe labors and anxieties during the war while he was Governor of Indiana, and rest and foreign travel failed to restore his health.

Business.

Notice—The Phrenological and Publishing Business heretofore conducted by the late S. R. Wells (formerly Fowler & Wells), will be continued by his widow, Mrs. Charlotte Fowler Wells, under the firm name of S. R. Wells & Co. Correspondents, Agents, and others, when communicating on business matters connected with this office, should address their letters to

S. R. Wells & Co., 737 Broadway, N. Y.

To Our English Readers.—We desire to announce to our readers and friends in the British Provinces, that we will accept as payment for our publications English or other foreign postage stamps, at the rate of 4s. 6d. for a dollar's worth, and send our books by mail, post-paid, at prices given in our announcements and lists. This will, without doubt, be a great accommodation to many, as our books are not always to be found in the local book-stores. If a book advertised at $1.50 is desired, send 6s. in postage stamps, and for other books at proportionate rates, and they will be sent by return mail.

Saratoga Springs.—Drs. Strongs' Remedial Institute has Turkish, Russian, Sulphur, Hydropathic and Electrical Baths, Vacuum Treatment, Inhalation of Oxygen, Compressed and Rarefied Air, Health-Lift, etc., for the treatment of Nervous, Lung, Female, and other Chronic Diseases.

Benefit of an Examination.—Chicago, Ill., July 4th, 1877. S. R. Wells & Co:—You may not remember me, but I shall never forget you nor your kind advice. About six months ago I sent you my photograph for analysis of character. I was then in a most wretched state of health, and desired your advice as to treatment. That advice and kindly encouragement has done me a great deal of good. I have continued to improve until my health may be considered firmly established. I have great faith in Phrenology, and that faith is being fortified by daily observation. L. B. M.

HOW TO MAKE
GRIDDLE, OR PAN CAKES,
BY THE USE OF
HECKER'S SELF-RAISING
GRIDDLE CAKE
TRADE MARK
FLOUR,
MAY BE SEEN AT
THE AMERICAN INSTITUTE FAIR.

Although it is only three years since this article (prepared expressly for making Griddle Cakes, Wheat Cakes, or Pan Cakes), was introduced to the public, it has become as popular as the other well-known brands of Hecker's Self-Raising Flour, which have been so extensively used for making Bread, Biscuit, Cakes, etc., for the past twenty-seven years.

It is decidedly the cheapest and best preparation known for making Griddle Cakes, Wheat Cakes, or Pan Cakes; Muffins, Fritters, etc.: producing at a moment's notice, by the addition only of cold water or milk, most delicious, light, and wholesome cakes, which may be eaten while hot without detriment.

The Griddle Cake Flour is used by many in preference to Buckwheat.

Put up in three and six pound packages (with a yellow label), 24½ pound bags, barrels, and half-barrels, with full directions for use.

FOR SALE BY ALL GROCERS, OR AT THE
CROTON MILLS, 203 CHERRY ST., NEW YORK.

Webster's Unabridged.

3000 Engravings. 1840 Pages Quarto.
FOUR PAGES COLORED PLATES.
A WHOLE LIBRARY IN ITSELF.
INVALUABLE IN A FAMILY.

The sale is 20 times as great as the sale of any other large Dictionary.

More than 30,000 copies have been placed in the public schools of the United States.

Recommended by 32 State Superintendents of Schools.

"Indispensable to every student of the English Language."—M. R. WAITE, *Chief Justice United States.*

THE MOUNTAIN HOME.

A. SMITH, M.D., Proprietor.

This well-known Health Institution stands preëminently superior in all that pertains to a perfect and complete cure. This is the case to such a degree that other parties have been sending out circulars, etc., claiming for their place that which belongs to the Mountain Home, thus deceiving the public. For cut of the Mountain Home, see August number PHRENOLOGICAL JOURNAL.

The "Mountain Home" is not merely a *coop* set on the side of the hill, but a perfect Health Institution in all its appointments, built on the side of the mountain. The three large buildings are so situated that each room has its proper portion of sunlight. The rooms are large, with high ceilings, and well ventilated, furnished with all that is necessary to render the sick comfortable. We have the advantages of a Western Union Telegraph Office in the "Home," five large Bathing and two large Swedish Movement rooms. All persons who visit the "Mountain Home" admit that we have the finest Location, Water, Air, Climate, Scenery, and all that goes to make up a perfect "Home" for invalids.

How Dr. A. Smith treats the sick, and why he is so successful in his practice: 1st. The Water-Cure in which there are no excesses with those who understand its principles and know how to apply it scientifically. To this fact Dr. Smith has hundreds of living examples, who rejoice in the recovery of good health through the proper application of the "Water-Cure;" 2d. The Swedish Movement Cure is one of the leading parts of the treatment at The Mountain Home. Dr. Smith practices this system as given by the great Dr. Lyng, the founder and fountain-head of the Hygienic Movement Cure. By long experience and scientific investigation, Dr. A. Smith has added many new and important features to the system; 3d. Electricity; this remedial agency is given in all cases where it will assist the patient to recover more rapidly; 4th. The Rest Cure. In nine cases out of ten the Rest Cure is absolutely necessary, and The Mountain Home is, above all others, *the* place where invalids have perfect rest and quietude; 5th. The Dietary Department of this Health Institution is beyond a doubt better adapted to the wants of invalids than that of any other Health Institution in this country; and Dr. Smith claims that *too* much preaching, with bad bread and butter, is not conducive to health and happiness.

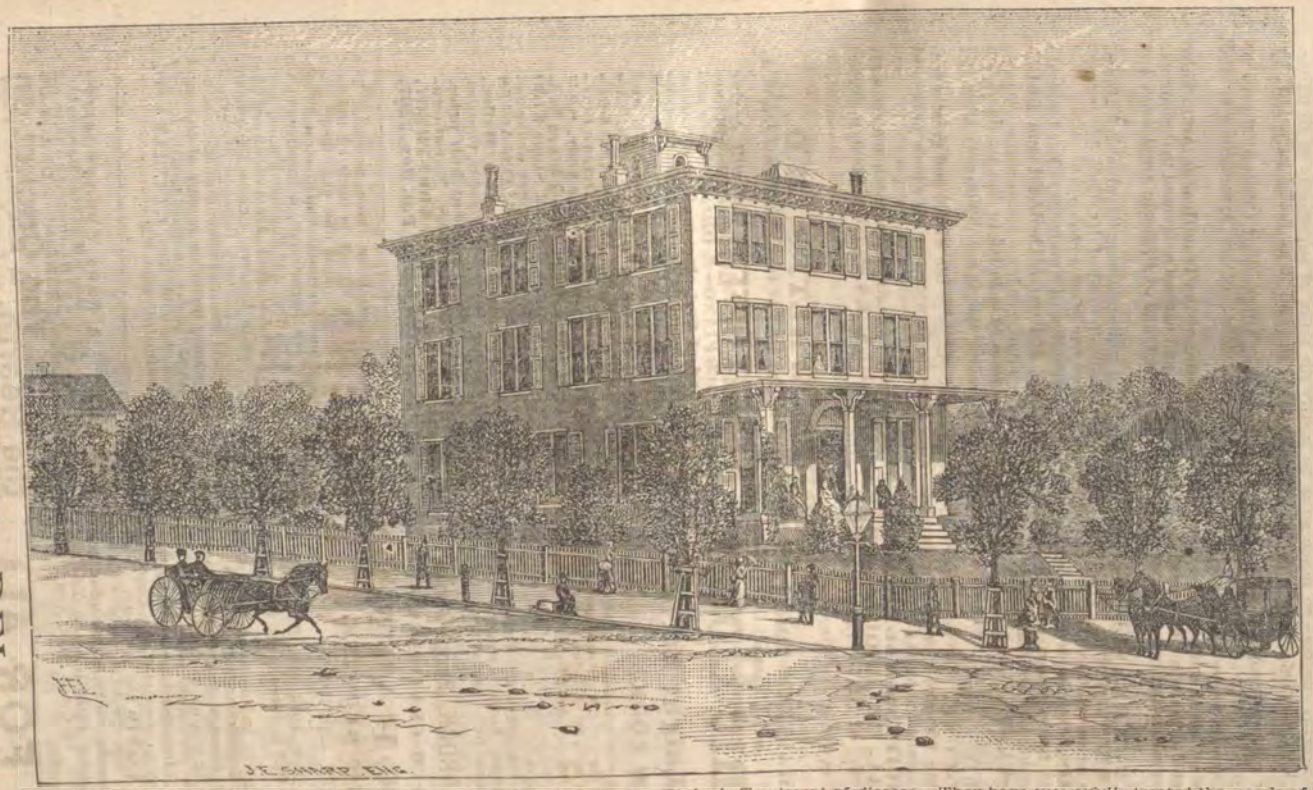
The natural advantages at "The Mountain Home" being so much greater than elsewhere, Dr. A. Smith can cure the sick in one-half the time it usually takes at other Cures. With divine aid and renewed energy, we shall try to surpass our former great success in the practice of the true healing art. For further information and circular, address

A. SMITH, M.D., MOUNTAIN HOME,
Wernersville, Berks Co., Pa.

Trall's Hygienic Institute,

Established in New York a few months since by the late R. T. TRALL, M.D., has been removed to 100 East 26th Street, and will be continued in all its departments by the undersigned, who has been for many years actively engaged in the work with Dr. Trall. The services of other competent physicians have been secured, and we are prepared to treat all cases with the best of Hygienic Agencies. All friends of the system are invited to call, and strangers visiting New York will find here good accommodations, with hygienic diet and baths. Send for circulars. Address **REBECCA L. TRALL, M.D., 100 East 26th St., New York.**

OUR HOME HYGIENIC INSTITUTE,



DANSVILLE, LIVINGSTON CO., N. Y.

This widely-known and celebrated Sanitarium, at which many thousand chronic invalids, suffering from the diseases common to the United States and Canada, have, without the use of any medicines, been restored to good health, will be open this Fall and Winter. It is the largest Health Institution in the world in which the sick are treated without medicine. Its physician-in-chief and his associates have, during the last thirty years, aided over twenty thousand men, women, and children to recover from ailments, many of which were considered incurable.

The Institute can accommodate comfortably 250 patients this Winter. Everything about it will be in first-class order, and in this beautiful valley, whose climate is so mild, Winter so short, air so invigorating, water so pure, and scenery so delightful, the most delicate invalids, if curable, can get well. Already there are nearly 100 ladies and gentlemen here, domiciliated for the winter. It should be distinctly understood that the Sanitarium is not a Water-Cure, nor a Drug-Cure, nor a Magnetic-Cure, but an Institute where invalids are treated according to the Laws of Life and Health, and so *get well*. All persons who, being sick, would like to be well, are respectfully invited to correspond with our physician-in-chief, Dr. James C. Jackson, inclosing stamp to prepay his answer, and he will gladly give all needed information. The best of testimonials will be furnished. Respectfully,

THE PROPRIETORS.

Heald's' Hygeian Home,

WILMINGTON, DEL.

Is now in its eighth year. Its physicians have had seventeen years' experience in the Hygienic Treatment of disease. They have *successfully* treated thousands of invalids *without medicines!* WINTER ADVANTAGES—Large double wall brick building, dry and warm. Southern location; short Winters; mild, healthful climate. Steam-heated air, by "indirect" radiation, *throughout* the house. Ventilating flues from the *base* of each room, leading to a Hot Air Ventilating Shaft, *insuring pure air* and *warm floors.* ☞ Invalids should not overlook the importance and value of this pure, warm atmosphere in selecting a Winter Home. BATH ROOMS have *extra* heat and ventilation. Pure, *soft* water. Improved HOT AIR AND STEAM BATHS, in which the head and air cells of the lungs are not exposed to the heat. Best appliances for all other judicious baths. ☞ Sun Baths. SWEDISH MOVEMENTS—We have DR. Taylor's new and improved apparatus, THE MANIPULATOR, VIBRATOR, etc.; HEALTH-LIFT, etc. *One half hour's* daily manipulation of each movement patient, by a skillful operator, under the direction of Dr. Pusey Heald, who has had *fifteen* years' *practical* experience in administering "Movements." ☞ HYGIENIC TREATMENT, without *judiciously prescribed* and *thoroughly administered* "Movements," lacks one of its most effective auxiliaries. ☞ A few minutes' kneading of the abdomen and percussion of the liver, etc., by an assistant, with a prescription for gymnastics *to be taken by the patient*, himself or herself, even though advertised "free," do not meet the necessities of invalids. OUR HYGIENIC TABLE has won the reputation of being "the best in America." ☞ 1,250 half gallons of choice fruit, etc., "canned" in *Glass* for this Winter's use. MEAT, etc., for those who wish. REDUCED TERMS—*Board*, $7 to $13 per week; *Board and Treatment*, $8 to $15 per week, according to rooms. Examination fee, $5; Movements, $2 per week. *No other extras!* Send stamp for Circular. Dr. Mary H. Heald's Lecture, "THE RELATIONS OF THE SEXES," sent for 10 cents. Stereoscopic Views of the "Home," 25 cents by mail.

PUSEY HEALD, M.D., MARY H. HEALD, M.D.

DRS. WALTER'S MOUNTAIN HOME,

WERNERSVILLE, BERKS CO., PA.

A new and first-class Health Institute, modern in all its appointments, built by the Drs. Walter for the purpose of Illustrating in practice the principles of the NUTRITIVE CURE. Its opening season has been a noteworthy success—so much so as to justify the claim of superiority in all important particulars. In the following respects we can unreservedly commend it as being surpassed by none on the continent:

Healthfulness of Location, Beauty of Scenery, Equableness and Mildness of Climate, Purity of Air, Purity and Softness of Water, Ease of Access, the Convenience of its Arrangements, and Thoroughness and Accuracy of its Management.

Its physicians are educated and of long experience in the practice of the True Healing Art. They are ambitious to excel, energetic in effort, positive in management, and earnestly devoted to their work. Sixteen years of observation and practice, extending over the whole range of hygienic appliances, has enabled us to employ:

1st. The **WATER-CURE** in moderation, avoiding its excesses while retaining its valuable features.

2d. The **MOVEMENT-CURE.** This Institution is the fountain-head of Hygienic Movement-Cure, *administered as an essential part of the treatment, and in all cases free of extra charge.*

3d. **SUN-BATHS.** So, too, we have led the van in the application of Sun-baths. For ten years we have been earnest investigators into this mode of treatment, and our SUN-BATH and BLUE-LIGHT rooms are models of excellence.

4th. The **DIET-CURE.** Good food and plenty of it, and such as is suited to the needs of the individual, expresses our ideas of diet. We believe in neither starving nor stuffing, but seek the golden mean between the extremes.

5th. The **REST-CURE.** We have one of the most restful places in the world, and great attention is paid to securing rest and sleep to the invalid. Ours is not a Summer-resort, where noise and confusion and excitement torment the invalid.

6th. **ELECTRICITY** and **MAGNETISM** are used as special remedial appliances when necessary.

7th. The **SOCIAL, RELIGIOUS,** and **MORAL INFLUENCES** are relied upon as important curatives (see notice of NUTRITIVE CURE on another page).

Circulars and Pamphlets sent free. Address

EVERYBODY'S FAVORITE ROCKER.

COMMON SENSE
Rocking Chairs!
A GOOD EASY-CHAIR

Is considered by many one of the most desirable things of earth. When one is rid of fatigue and weariness, and can bear with tedious visitors and commonplace remarks, and left to his own reflections, he finds himself amid society of phantoms and visions suited to his mind. Those in need of such a chair will please send stamp for Illustrated Circulars and Price-List to

F. A. SINCLAIR,
Mottville, Onondaga Co., N. Y.

On Sale at 218 Fulton St., Brooklyn, and in New York.

☞ Don't buy a Chair unless it has my name stamped on the frame.

LOOK FOR THE STAMP.

PREVENT DECAY OF THE TEETH
WITH THEIR SUREST PRESERVATIVE, AROMATIC
SOZODONT

WHITENESS of the dental row, a healthful rosiness and hardness of the gums, a sweet breath, an agreeable taste in the mouth—all these are conferred by SOZODONT. Does not such an invaluable toilet article, one so pure as well as effective, deserve the popularity it enjoys? Most assuredly. It has no rival worthy of the name. The ordinary powders and pastes are nothing to it, and since its appearance, have rapidly lost ground.

Sold by Druggists.

THE NEW $20 MICROSCOPE.

This is a serviceable and thoroughly well-made instrument, and is not to be confounded with those cheap microscopes which are low-priced simply because they are worthless. The foot is of cast iron, and the body inclines to any angle. The tube through which the body moves is of brass, and the body itself is also of brass, and heavily nickel-plated, so as to move with the utmost smoothness. The movement is effected by a very finely-cut rack and pinion, the milled heads being very large, so that the utmost delicacy and precision may be attained and consequently powers as high as a one-fifth can be used with good effect. It is capable of doing good service in the hands of the physician and the naturalist, and being very simple and easily managed, it is just the thing for the family.

The Stage is vulcanite; Mirror swings so as to give oblique light; Diaphragm underneath the stage; the Body has the "Society" screw; and the Objectives are by Gundlach—achromatic and well corrected. Three years ago Objectives of the same quality could not be bought for less than the price now asked for the whole microscope. Two Eye-Lenses. Powers, 55, 95, 130 and 225 diameters.

Those who wish to get a good microscope and yet do not know just what they want, can buy this microscope with the privilege of exchanging it at full value for a better instrument, any time within one year.

This Microscope has been elaborated at our suggestion by Mr. Gundlach, and is made EXCLUSIVELY for us by the Bausch & Lomb Optical Company, of Rochester, N. Y. It can not be obtained, except through us. Descriptive Circular sent on application.

Price in fine Black Walnut Case, with fittings for Accessories, Drawer for slides, etc., Handle, Lock and Key, $20 00.

Address **S. R. WELLS & CO., Publishers, 737 Broadway, N. Y**

DANA BICKFORD'S
Garden-Pump and Fire-Engine.

This is the most perfect and most easily-worked machine of the kind ever made, and makes an article of this kind of universal usefulness. One of these should be found in every household for use in watering Gardens, Flowers, Conservatories, washing Windows, Carriages, Buildings, etc., and for use in case of Fire, when it will be found very efficient, and for any purpose where a force or portable pump is used. It is worked by an easy motion of a lever to and fro, so easy that a lady or child can throw a steady stream of water over an area of 60 to 80 feet, or on the top of buildings from a pail or tank at hand, or from a distance of one or two hundred feet, without the least fatigue.

Believing these will be universally wanted, we have arranged to offer them as Premiums for Clubs to the PHRENOLOGICAL JOURNAL on most favorable terms. The price is only $5, and given for a Club of only four subscribers at $2 each, or it will be sent to any address on receipt of price, $5.

No Piston, no Stuffing Box, no Friction, no Leakage, Easily Worked, and Always Ready for Use.

WE OFFER THIS

KNITTING MACHINE

To the Public in the fullest confidence of its absolute, unquestioned superiority over all other machines of the kind. Every known improvement is embodied in it, making it by far the most simple, durable, and efficient Knitting Machine ever placed in market.

This machine, and the Garden-Pump, are manufactured by the Dana Bickford Co., 689 Broadway, N. Y.

These Machines are easily managed; not liable to get out of order; can be attached to an ordinary table and worked by a child. Adapted to the production of a great variety of work, both of plain homespun for wearing apparel, hosiery, etc., and elaborate crochet stitching of the most varied character, limited only by the skill and taste of the operator, making it a never-ending source of pleasure or easy support to those that require it, as a good operator can make from two to eight dollars per day.

These Machines are sold for $30, and we offer them for only fifteen subscribers to the PHRENOLOGICAL JOURNAL at $2 each (just the price of the Machine alone).

Send Twenty Cents for Agents' Outfit, and procure one of each of the above at once. AGENTS WANTED to canvass for the PHRENOLOGICAL JOURNAL AND SCIENCE OF HEALTH. Liberal Premiums or Cash Commissions are given. Address

S. R. WELLS & CO., Publishers, 737 Broadway, New York.

Hartford, Aug., 1877.

"THE MAGAZINE OF MAGAZINES."—*Philadelphia Press.*

THE MOST EMINENT LIVING AUTHORS, such as

Rt. Hon. W. E. Gladstone,	The Duke of Argyll,	Geo. MacDonald,
Prof. Max Muller,	Mrs. Muloch,	Julia Kavanagh,
Prof. Tyndall,	Wm. Black,	Matthew Arnold,
Dr. W. B. Carpenter,	Jean Ingelow,	Henry Kingsley,
Richard A. Proctor,	Miss Thackeray,	W. W. Story,
Prof. Huxley,	Sarah Tytler,	Ivan Turguenieff.
James Anthony Froude,	Mrs. Oliphant,	Berthold Auerbach,
Edward A. Freeman,	R. D. Blackmore,	Ruskin,
Frances Power Cobbe,	Mrs. Alexander,	Tennyson,
D. Mackenzie Wallace,	Mrs. Macquoid,	Browning,

and many others, are represented in the pages of

LITTELL'S LIVING AGE.

The Living Age has been published for more than thirty-three years, and is admittedly unrivalled in its special field. It has never failed to receive the warmest support of the best men of the country, and has met with constantly increasing success.

A Weekly Magazine, of sixty-four pages, The Living Age gives more than

Three and a Quarter Thousand

double-column octavo pages of reading-matter yearly, forming four large volumes. It presents in an inexpensive form, considering its great amount of matter, with freshness, owing to its weekly issue, and with a *satisfactory completeness* attempted by no other publication, the best Essays, Reviews, Criticisms, Tales, Sketches of Travel and Discovery, Poetry, Scientific, Biographical, Historical, and Political Information, from the entire body of Foreign Periodical Literature.

During the coming year, the productions of

THE LEADING FOREIGN AUTHORS

will be presented in its pages, — embracing the choicest Serial and Short Stories, and an amount

Unapproached by any other Periodical

in the world, of the most valuable Literary and Scientific matter of the day, from the pens of the foremost Essayists, Scientists, Critics, Discoverers and Editors, **above-named and many others**, representing every department of Knowledge and Progress.

The Living Age is, in short, a time, labor, and money-saving publication, furnishing the only satisfactorily COMPLETE as well as fresh compilation of a literature that is indispensable to *every American reader*, — *indispensable* because it embraces the productions of

THE ABLEST LIVING WRITERS

in all branches of Literature, Science, Art, and Politics. Attention is invited to the following recent

Opinions.

"The Living Age affords the best, the cheapest, and most convenient means of keeping abreast with the progress of thought in all its phases. . . . It is the best work of its kind ever published in the country, and can hardly ever be improved upon."—*North American, Philadelphia.*

"In it we find the best productions of the best writers upon all subjects ready to our hand. . . . Through its pages alone it is possible to be as thoroughly well informed in current literature as by the perusal of a long list of monthlies." — *Philadelphia Inquirer.*

"Cannot be matched by any other periodical." — *Episcopal Register, Philadelphia.*

"For all who desire to know the tendencies of current thought and feeling, *The Living Age* is not simply desirable, but necessary and indispensable." — *Boston Journal.*

"Grows richer and richer the longer it lives. There is no other known way of getting so much good reading for so little money." — *Christian Register, Boston.*

"Fairly without a rival." — *Congregationalist, Boston.*

"Its frequent issue and ample space enable it to do fully what it proposes to do, — to give *all* that the very ablest of living writers furnish to periodical literature on science, history, biography, philosophy, poetry, theology, politics and criticism, and to add to this the full complement of the best that there is in fiction." — *The Interior, Chicago.*

"Every weekly number of *The Living Age* now-a-days is equal to a first-class monthly. For solid merit, it is the cheapest magazine in the land." — *The Advance, Chicago.*

"It is incomparable in the richness, variety, and sterling worth of its articles." — *The Standard, Chicago.*

"It contains the best results of the world's thinking." — *The Churchman, New York.*

"Its pages teem with the choicest literature of the day." — *New-York Tribune.*

"It is, beyond all question, the best compendium of the best current literature." — *New-York Evening Post.*

"*With it alone* a reader may fairly keep up with all that is important in the literature, history, politics, and science of the day." — *The Methodist, New York.*

"A pure and perpetual reservoir and fountain of entertainment and instruction." — *Hon. Robert C. Winthrop.*

"The best periodical in America." — *Rev. Theo. L. Cuyler, D.D.*

"It has no equal in any country." — *Philadelphia Press.*

"The most valued of all the issues of the periodical press. . . . In offering in their completeness and freshness the best stories, sketches, essays, and reviews of the day, *The Living Age* has distanced all competitors among the eclectics, and well deserves a place in every household." *Iowa Churchman, Davenport.*

"The ablest essays, the most entertaining stories, the finest poetry of the English language are here gathered together." — *Illinois State Journal.*

"In fact, a reader needs no more than this one publication to keep him well abreast of English periodical literature." — *Sunday-School Times, Philadelphia.*

"To keep up with it, is to master the best thought of our time." — *Illustrated Christian Weekly, New York.*

"Of all periodicals in the world, if a man can take only one, he should by all means take The Living Age." — *Mobile Register.*

"There is no magazine published that gives so general a knowledge of what is going on in the literary world." — *Presbyterian Weekly, Baltimore.*

"It is the only compilation that presents with a satisfactory completeness, as well as freshness, a literature embracing the productions of the ablest and most cultured writers living. *It is, therefore, indispensable to everyone who desires a thorough compendium of all that is admirable and noteworthy in the literary world.*" — *Boston Post.*

"Ought to find a place in every American home." — *New-York Times.*

Published Weekly, at $8.00 a year, *free of postage.* An extra copy sent *gratis* to any one getting up a club of five new subscribers.

☞ EXTRA OFFER FOR 1878. ☜

All new subscribers for 1878, will receive *gratis* the six numbers of 1877, containing the first instalments of a new serial, "**ERICA,**" translated from the German of Frau von Ingersleben, — the best work of one of the best and brightest authors of Germany. A new story by the charming English authoress, **MISS THACKERAY,** also appears in the same numbers, and the usual amount of other valuable matter.

CLUB-PRICES FOR THE BEST HOME AND FOREIGN LITERATURE.

["Possessed of 'Littell's Living Age' and of one or other of our vivacious American monthlies, a subscriber will find himself *in command of the whole situation.*"—*Philadelphia Evening Bulletin.*]

For $10.50, The Living Age and either one of the American *four-dollar* monthly Magazines (or *Harper's Weekly* or *Bazar*), will be sent for a year, *with postage prepaid on both;* or, for $9.50, The Living Age and the *St. Nicholas*, or *Appleton's Journal*, *both postpaid.*

Address **LITTELL & GAY, 17 Bromfield St., Boston.**

Demorest's Illustrated Monthly.

The Model Parlor Magazine of America contains the essentials of all others, including Original Poetry, Sketches and Stories, by the best writers.
